The Relative Contributions of Sulfuric and Nitric Acids in Acid Rain to the Acidification of the Ecosystem. Implications for Control Strategies,
W82-02913 5C

An Analysis of the First Year of MAP3S Rain Chemistry Measurements,
W82-02934 2K

ACIDIC WATER
Toxicity of Environmental Acid to the Rainbow Trout: Interactions of Water Hardness, Acid Type, and Exercise,
W82-02631 5C

ACOUSTICS
Acoustic Reflection from Estuarine Pycnoclines,
W82-02722 2L

ACTIVATED ALUMINA
The Equilibrium Fluoride Capacity of Activated Alumina,
W82-02968 5F

ACTIVATED CARBON
Application of Adsorption to Wastewater Treatment,
W82-02622 5D

Separation of Toxic Organotin Compounds from Aqueous Solution by Adsorption,
W82-02641 5D

Wastewater Treatment with Powdered Activated Carbon,
W82-02642 5D

Adsorption on Carbon: Theoretical Considerations,
W82-02658 5D

Comparative Performance of Synthetic Adsorbents and Activated Carbon for Specific Compound Removal from Wastewaters,
W82-02702 5D

Practical Experiences in Plants Using Activated Carbon,
W82-02788 5F

Removing Trace Organics from Drinking Water Using Activated Carbon and Polymeric Adsorbents,
W82-02987 5F

ACTIVATED SLUDGE
The Microfauna of Activated Sludges. Study of an Observation Method and Application to Monitor a Pilot Plant During the Start-Up Phase. (La Microfauna Des Boues Activees. Etude D'une Methode D'Observation Et Application Au Suivi D'un Pilote En Phase De Demarrage,
W82-02960 5D

ACTIVATED SLUDGE PROCESS
Stochastic Modeling of an Industrial Activated Sludge Process,
W82-02683 5D

Combined Effects of Cadmium and Nickel on Activated Sludge Process,
W82-02704 5D

Totnes Sewage Treatment, Resewerage and Flood Prevention Scheme.
W82-02872 5D

ADIRONDACK MOUNTAINS
Aluminum Toxicity to Fish as Related to Acid Precipitation and Adirondack Surface Water Quality,
W82-02726 5C

ADSORBENTS
Comparative Performance of Synthetic Adsorbents and Activated Carbon for Specific Compound Removal from Wastewaters,
W82-02702 5D

Removing Trace Organics from Drinking Water Using Activated Carbon and Polymeric Adsorbents,
W82-02987 5F

ADSORPTION
Application of Adsorption to Wastewater Treatment,
W82-02622 5D

Separation of Toxic Organotin Compounds from Aqueous Solution by Adsorption,
W82-02641 5D

Adsorption on Carbon: Theoretical Considerations,
W82-02658 5D

Forms of Heavy Metals in the Settling Matter from a Man Made Lake (In Japanese),
W82-02719 5B

Adsorption of Dissolved Organics in Lake Water by Aluminum Oxide. Effect of Molecular Weight,
W82-02940 5F

The Equilibrium Fluoride Capacity of Activated Alumina,
W82-02968 5F

AEGEAN SEA
Pollution Effects on the Phytoplankton-Zooplankton Relationships in an Inshore Environment,
W82-02886 5C

AERATION
Measurements of Self-Aerated Flow on a Spillway,
W82-02715 8B

Transfer of Volatile Substances from Water to the Atmosphere,
W82-02902 1B

Wind Aeration in Model Waste Treatment System,
W82-02944 5D

AFRICA
Standing Crop Densities and Distribution of Spirulina and Benthic Diatoms in East African Alkaline Saline Lakes,
W82-02759 2H

AGRICULTURAL ENGINEERING
Modeling Rill Density,
W82-02604 2J

AGRICULTURAL RUNOFF
Cropland, Buffer, and Stream: A Case Study in Agricultural Nonpoint Source Water Pollution,
W82-02728 5G

AGRICULTURE
Selection of Irrigation Systems for Land Application of Municipal Wastewater,
W82-02643 3C

ALABAMA
Geology and Water Availability of Dallas County, Alabama,
W82-02833 6D

ALASKA
Water Resources Data for Alaska, Water Year 1980.
W82-02845 7C

Water Resources Appraisals for Hydroelectric Licensing: Alaska River Basins, Alaska.
W82-02975 6D

ALGAE
Effect of N-Benzoquinone and of Some Polyphenols on the Membrane Potential of Nitella Sp. Measured by the Open-Vacuole Method,
W82-02626 5C

Quantitative Composition, Distribution, Community Structure and Standing Stock of Sea Ice Microalgae in the Canadian Arctic,
W82-02649 2C

Recommendations for Regulatory Modifications: The Use of Waste Stabilization Pond Systems,
W82-02675 5D

Toxicity of Textile Mill Effluents to Freshwater and Estuarine Algae, Crustaceans and Fishes,
W82-02710 5C

Studies on the Ability of a Potamogeton Pectinatus Community to Remove Dissolved Nitrogen and Phosphorus Compounds from Lake Water,
W82-02724 5B

On the Algal Ecology of the Lowland Iraqi Marshes,
W82-02777 6G

The Production Ecology of Benthic Plants in Some Antarctic Lakes. II. Laboratory Physiology Studies,
W82-02861 2H

Morphological Changes in Toxic and Non-Toxic Microcystis Isolates at Different Irradiance Levels,
W82-02906 5C

Changes in Flora Down a Stream Showing a Zinc Gradient,
W82-02946 5C

ALGAL CONTROL
The Clear Lake Example: An Ecological Approach to Pest Management,
W82-02660 5F

ALGAL GROWTH
Absorption by Chlorella Vulgaris Beijer. of Phosphorus Compounds Released by the Submerged Macrophyte Potamogeton Pectinatus L.,
W82-02780 2H

ALGORITHMS
Computerized Control of an Open-Channel Water Distribution System,
W82-02732 4A

ALLUVIAL CHANNELS
River and Suspended Sediment Discharge into Byam Channel, Queen Elizabeth Islands, Northwest Territories, Canada,
W82-02637 2E

ALPINE REGIONS
Physicochemical Influences on Phytoplankton Production in a Tropical Alpine Lake,
W82-02921 2H

ALTERATION OF FLOW
Local Flow Accelerations in Rivers,
W82-02758 2E

ALTITUDE
Winter Water Relations of Red Spruce on Mount Monadnock, New Hampshire,
W82-02634 2I

ALUMINUM OXIDE
Adsorption of Dissolved Organics in Lake Water by Aluminum Oxide. Effect of Molecular Weight,
W82-02940 5F

AMMONIA
Upgrading with Rotating Biological Contractors for Ammonia Nitrogen Removal,
W82-02673 5D

Blue-Green Algal Ammonia Uptake in Hypertrophic Prairie Lakes,
W82-02914 2H

Ammonia Volatilization in a Hypertrophic Prairie Lake,
W82-02915 2H

AMPHIPODS
Production of Gammarus Lacustris (Amphipoda, Gammaridae) in Lake Sevan,
W82-02781 2H

AMVRAKIA LAKE
Some Hydrobiological Characteristics in Amvrakia Lake, Western Greece,
W82-02753 2H

ANAEROBIC CONDITIONS
Kinetics of Trace Metal Partitioning in Model Anoxic Marine Sediments,
W82-02820 5B

ANAEROBIC DIGESTION
Evaluation of the Full-Scale Application of Anaerobic Sludge Digestion at the Blue Plains Wastewater Treatment Facility - Washington, D.C.,
W82-02965 5D

Pilot-Scale Anaerobic Filter Treatment of Heat Treatment Liquor,
W82-02972 5D

ANDROSCOGGIN RIVER
Origin and Chemical Composition of Androscoggin River Foam,
W82-02970 5B

ANNUAL DISTRIBUTION
Calculation of the Annual Distribution of River Runoff When Observation Data Are Available,
W82-02854 2E

ANTARCTIC
The Production Ecology of Benthic Plants in Some Antarctic Lakes. I. In Situ Production Studies,
W82-02860 2H

The Production Ecology of Benthic Plants in Some Antarctic Lakes. II. Laboratory Physiology Studies,
W82-02861 2H

Production Strategies in Antarctic Inland Waters: Phytoplankton Eco-Physiology in a Permanently Ice-Covered Lake,
W82-02862 2C

AQUACULTURE
Estimation of Primary Productivity from Diel Nitrate Uptake Measurements of the Water Hyacinth Eichhornia Crassipes in an Aquaculture System,
W82-02635 5D

PP and L Uses Discharge Water for Fish Farming,
W82-02645 3C

Effects of Hydrological and Biological Variables on the Survival, Growth, and Food Utilization of Estuarine Fishes Cage-Cultured in a Heated Water System,
W82-02730 5C

Mineral Nutrient Availability in Watercress Bed Substrates,
W82-02769 2I

Urban Aquaculture of the Rainbow Trout (Salmo gairdneri),
W82-02812 8I

AQUATIC INSECTS
How Abiotic Factors Affect the Distribution of Two Species of Tropical Predaceous Aquatic Bugs (Family: Naucoridae),
W82-02633 7A

AQUATIC LIFE
The Effect of Alpha-Hydroxybenzylmethanesulfonate on Photosynthesis and Excretion of Chlorella and Natural Phytoplankton in a Lake,
W82-02918 5C

AQUATIC PLANTS
Studies on the Ability of a Potamogeton Pectinatus Community to Remove Dissolved Nitrogen and Phosphorus Compounds from Lake Water,
W82-02724 5B

Changes in Flora Down a Stream Showing a Zinc Gradient,
W82-02946 5C

AQUATIC POPULATIONS
The Freshwater and Brackish-Water Diatoms of Penikese Island, Massachusetts: 1923-1973,
W82-02696 2H

AQUATIC VEGETATION
The Gammaridae and Corixidae of an Inland Saline Lake from 1975 to 1978,
W82-02779 2H

AQUATIC WEED CONTROL
The Clear Lake Example: An Ecological Approach to Pest Management,
W82-02660 5F

AQUIFER
Digital-Model Simulation of the Hydrologic Flow System, with Emphasis on Ground Water, in the Spokane Valley, Washington and Idaho,
W82-02836 2F

AQUIFER CHARACTERISTICS
Estimation of Calcium Sulfate Solution Rate and Effective Aquifer Surface Area in a Ground-Water System near Carlsbad, New Mexico,
W82-02612 2F

Analysis of Pumping Test Data Using Marquardt Algorithm,
W82-02721 2F

Radiocarbon Dating of Groundwater of the Aquifer Confined in the Lower Triassic Sandstones of the Lorraine Region, France,
W82-02877 2F

Determination of Aquifer Parameters from Large-Diameter Dug Well Pumping Tests,
W82-02917 2F

A Geochemical Method of Determining Dispersivity in Regional Groundwater Systems,
W82-02941 2F

Preparation of Friable Aquiferous Specimens,
W82-02955 2F

AQUIFER CHARCTERISTICS
Ground-Water Appraisal of Sand Plains in Benton, Sherburne, Stearns, and Wright Counties, Central Minnesota,
W82-02838 2F

AQUIFER MANAGEMENT
Aquifer Thermal Energy Storage: A Numerical Simulation of Auburn University Field Experiments,
W82-02919 4B

AQUIFER PROPERTIES
Geoelectric Soundings for Predicting Aquifer Properties,
W82-02619 2F

AQUIFER SYSTEMS
Atoll Island Hydrology,
W82-02617 2F

AQUIFER TESTING
A Method of Performing Response Tests on Highly Permeable Aquifers,
W82-02916 2F

Determination of Aquifer Parameters from Large-Diameter Dug Well Pumping Tests,
W82-02917 2F

AQUIFERS
Ground-Water Appraisal of Sand Plains in Benton, Sherburne, Stearns, and Wright Counties, Central Minnesota,
W82-02838 2F

Potentiometric Surface Maps of the Sparta Sand: Northern Louisiana and Southern Arkansas, 1900, 1965, 1975, and 1980,
W82-02839 2F

Water-Level Records for the Big Sioux Aquifer, Minnehaha County, South Dakota,
W82-02844 2F

ARCTIC ZONE
Quantitative Composition, Distribution, Community Structure and Standing Stock of Sea Ice Microalgae in the Canadian Arctic,
W82-02649 2C

ARGENTINA
Argentina's Hydroelectric-Based Energy Plan,
W82-02794 8A

ARKANSAS
Potentiometric Surface Maps of the Sparta Sand: Northern Louisiana and Southern Arkansas, 1900, 1965, 1975, and 1980,
W82-02839 2F

AROMATIC COMPOUNDS
Management of Ground Water Contaminated by Aromatic Hydrocarbons in the Aquifer Supplying Ames, Iowa,
W82-02611 5B

ARSENIC
Application of Hydride Generation to the Determination of Trace Concentrations of Arsenic by Inductively-Coupled Plasma Atomic Emission Spectrometry,
W82-02718 5A

Differential Pulse Polarographic Determination of Inorganic and Organic Arsenic in Natural Waters,
W82-02903 5A

Inorganic Contaminant Removal from Drinking Water by Reverse Osmosis,
W82-02969 5F

Characterization of Boliden's Sulfide-Lime Precipitation System,
W82-02988 5D

ARSENIC COMPOUNDS
Differential Pulse Polarographic Determination of Inorganic and Organic Arsenic in Natural Waters,
W82-02903 5A

ASBESTOS
Concentration of Virus from Tap Water at Ambient Salt and pH Levels Using Positively Charged Filter Media,
W82-02712 5A

Vinyl Lined Asbestos Cement Pipe Problems, Operator Aspects,
W82-02898 5B

ASPHALTIC CONCRETE
Bituminous Concrete Antiseepage Curtain for Concrete Dams,
W82-02690 8A

ASSIMILATIVE CAPACITY
Carbon Dioxide Assimilation, Photosynthetic Efficiency, and Respiration of a Chesapeake Bay Salt Marsh.
W82-02937 2L

ATOLLS
Atoll Island Hydrology,
W82-02617 2F

AUSTRALIA
Management of Soil Water Budgets of Recharge Areas for Control of Salinity in South-Western Australia,
W82-02754 3F

South Australia's Approach to Salinity Management in the River Murray,
W82-02761 5G

The Influence of Stream Salinity on Reservoir Water Quality,
W82-02762 4C

The Evolution of a Regional Approach to Salinity Management in Western Australia,
W82-02763 4D

Analyses of Solute Distributions in Deeply Weathered Soils,
W82-02764 2K

Groundwater Systems Associated with Secondary Salinity in Western Australia.
W82-02770 2F

Fish Movement Upstream Through a Central Queensland (Fitzroy River) Coastal Fishway,
W82-02800 8I

Seasonal Salinity Variations in Cleveland Bay, Northern Queensland,
W82-02878 2L

AUTOMATION
A Rate of Rise Controller for Automatic Water Samplers,
W82-02938 7B

AVAILABLE WATER
Geology and Water Availability of Dallas County, Alabama,
W82-02833 6D

BACTERIA
The Distribution and Seasonal Fluctuations of Heterotrophic Bacteria and Coliform Bacteria in the Rivers and Estuaries in Osaka City, Japan (In Japanese),
W82-02774 5A

Distribution of Chromobacteria in a Lowland River,
W82-02795 5C

Bactericidal Effect of Seawater Containing Digested Night Soil and Marine Plankton Against Intestinal Bacteria, (In Japanese),
W82-02799 5E

Bacteria from a Suspended Growth System as Organic Precursors to the Formation of Trihalomethanes,
W82-02806 5F

Physical Characterization of Extra-Chromosomal DNA in Chesapeake Bay Bacteria from Polluted and Non-Polluted Sites,
W82-02814 5B

The Use of Dialyzing Sacks in Estimation of Production of Bacterioplankton and Phytoplankton,
W82-02866 7B

Growth Characteristics of the Heterotrophic Bacterial Population of Water and Bottom Sediments in Tanks Under Different Trophic Conditions,
W82-02953 5C

BACTERIAL PHYSIOLOGY
Bacteria from a Suspended Growth System as Organic Precursors to the Formation of Trihalomethanes,
W82-02806 5F

BACTERICIDES
Prevention of Putrefaction in Organic Sludge by Co-Precipitation of Bactericide and Coagulant,
W82-02717 5D

New Antimicrobial Agents for Treatment of Water,
W82-02808 5F

BALDWIN LAKE
Chironomidae (Diptera) of Baldwin Lake, Illinois, a Cooling Reservoir,
W82-02620 2H

BARRIER ISLANDS
The Response of Macroinvertebrates to Aquatic Macrophyte Decomposition,
W82-02664 2H

BASE FLOW
Low-Flow Characteristics of Kentucky Streams, 1980,
W82-02826 2E

BED LOAD
Flow Resistance in Coarse Gravel Bed Rivers,
W82-02879 2J

Bed Load Discharge Coefficient,
W82-02936 2J

BELGIUM
Effects of Short-Term Changes in Rain Water Supply on the Ionic Composition of Acid Moorland Pools in the Campine of Antwerp (Belgium),
W82-02775 2H

BENTHIC FAUNA
The Response of the Invertebrate Fauna to Organic Pollution in a Well Oxygenated Karst Stream Exemplified by the Pradnik Stream (South Poland),
W82-02751 5C

Factors Influencing the Composition, Structure and Density of a Population of Benthic Invertebrates,
W82-02909 2H

BENTHIC FLORA
The Production Ecology of Benthic Plants in Some Antarctic Lakes. I. In Situ Production Studies,
W82-02860 2H

BENTHOS
The Gammaridae and Corixidae of an Inland Saline Lake from 1975 to 1978,
W82-02779 2H

The Relation Between 'Hydraulic Stress' and Microdistribution of Benthic Macroinvertebrates in a Lowland Running Water System, the Schierenseebroks (North Germany),
W82-02790 5C

On the Sampling Size of Zoobenthos Along a Lake Shore (In Janpanese),
W82-02796 2H

Screen Mesh Size Affects Estimates of Macro- and Meio-Benthos Abundance and Biomass in the Great Lakes,
W82-02912 2H

BIG SIOUX AQUIFER
Water-Level Records for the Big Sioux Aquifer, Minnehaha County, South Dakota,
W82-02844 2F

BIOASSAY
Reduction of Toxicity to Aquatic Organisms by Industrial Wastewater Treatment,
W82-02971 5C

BIOCHEMICAL OXYGEN DEMAND
To Inhibit or Not to Inhibit: That is The Question,
W82-02672 5A

Recommendations for Regulatory Modifications: The Use of Waste Stabilization Pond Systems,
W82-02675 5D

Oxygen-Consuming Organics in Nonpoint Source Runoff,
W82-02966 5B

BIODEGRADATION
Treatment Plant Features Ultraviolet Disinfection,
W82-02644 5D

Biodegradation of Aroclor 1221 Type PCBs in Sewage Wastewater,
W82-02899 5D

BIOLOGICAL TREATMENT
Upgrading with Rotating Biological Contractors for Ammonia Nitrogen Removal,
W82-02673 5D

Reduced Energy Usage with Biological Phosphorus Removal,
W82-02705 5D

BIOMASS
Screen Mesh Size Affects Estimates of Macro- and Meio-Benthos Abundance and Biomass in the Great Lakes,
W82-02912 2H

Predicting Reactor Biomass Concentration in a Fluidized-Bed System,
W82-02932 5D

BLEACHING WASTES
Field Report on a Nonpolluting Bleach Plant,
W82-02793 5D

Evaluation of Ion Exchange Technology for Toxic and Non-Conventional Pollutant Reduction in Bleach Plant Effluents,
W82-02967 5D

BOGS
Effects of Short-Term Changes in Rain Water Supply on the Ionic Composition of Acid Moorland Pools in the Campine of Antwerp (Belgium),
W82-02775 2H

BOISE
Boise Looks Underground for Heat.
W82-02636 2F

BOTTOM SEDIMENTS
A Sediment Trap Experiment in Funka Bay, Japan: 'Upward Flux' of Particulate Matter in Seawater,
W82-02893 2K

BOUNDARIES
Boundary Calculations of Sluice and Spillway Flows,
W82-02677 8B

BRIDGE DESIGN
Umfolozi Road Bridge Hydraulic Model Investigation,
W82-02868 8A

BRIDGES
Umfolozi Road Bridge Hydraulic Model Investigation,
W82-02868 8A

BRITISH COLUMBIA
Galvanized Pipe Vies for Equal Alternative Status in Storm Sewer Projects.
W82-02601 8G

Regionalization and Prediction of Annual Floods in the Fraser River Catchment, British Columbia,
W82-02910 2E

BROMIDES
Kinetics of Monochloramine Decomposition in the Presence of Bromide,
W82-02651 5B

BURLINGTON
Restoring an Antique Water System.
W82-02685 5F

CADMIUM
Combined Effects of Cadmium and Nickel on Activated Sludge Process,
W82-02704 5D

CALCIUM SULFATE
Estimation of Calcium Sulfate Solution Rate and Effective Aquifer Surface Area in a Ground-Water System near Carlsbad, New Mexico,
W82-02612 2F

CANADA
Environmental Implications and Assessments of Hydroelectric Projects,
W82-02896 6G

CANAL CONSTRUCTION
Applicability and Design Criteria of a Blasting Method for Constructing Deep-Cut Sections of a Canal for Transferring Part of the Flow of Siberian Rivers,
W82-02783 8H

CANOPY
Vertical Variation in Stemflow Generation,
W82-02959 2I

CAPE FEAR RIVER ESTUARY
Kinetics of Monochloramine Decomposition in the Presence of Bromide,
W82-02651 5B

CARBON
Wastewater Treatment with Powdered Activated Carbon,
W82-02642 5D

Adsorption on Carbon: Theoretical Considerations,
W82-02658 5D

CARBON DIOXIDE
Carbon Dioxide Assimilation, Photosynthetic Efficiency, and Respiration of a Chesapeake Bay Salt Marsh,
W82-02937 2L

CARCINOGENS
Performance Predictions for Removal of Toxic and Carcinogenic Compounds from Water Supplies by Adsorption,
W82-02729 5D

Vinyl Lined Asbestos Cement Pipe Problems, Operator Aspects,
W82-02898 5B

CASINGS
Scroll Casings of Steel and Reinforced-Concrete Construction,
W82-02784 8G

CATFISH
PP and L Uses Discharge Water for Fish Farming.
W82-02645 3C

CATTLE
Resource Allocation in a Sierra-Nevada Foothill Beef Cow-Calf Operation Through Linear Programming,
W82-02809 3F

CAVITATION
Modeling Cavitation for Closed Conduit Flow,
W82-02700 8B

CAZENOVIA CREEK
A Solution to Spring Ice-Jam Flooding,
W82-02908 2C

CELLULOSE ACETATE MEMBRANES
Scanning Electron Microscopy Study on Reverse Osmosis Membranes Prepared from Indian Cellulosic Polymers,
W82-02929 3A

CENTRIFUGATION
Evaluation of High- and Low- Speed Centrifuges,
W82-02931 5E

CHANNEL FLOW
Boundary Shear in Smooth and Rough Channels,
W82-02711 8B

Flow Resistance in Coarse Gravel Bed Rivers,
W82-02879 2J

CHANNEL SCOUR
Closure of the Kama River at the Site of the Lower Kama Hydroelectric Plant,
W82-02951 8A

CHEMICAL ANALYSIS
Multivariate Analysis and Geochemical Interpretation of Spatial Variability of the Water Quality of Southern Quebec Rivers. (Analyse Multivariee et Interpretation Geochimique de la Variabilite Spatiale de la Qualite de l'Eau Des Rivieres Du Quebec Meridional),
W82-02662 2K

An Analysis of the First Year of MAP3S Rain Chemistry Measurements,
W82-02934 2K

CHEMICAL COAGULATION
Chemical Coagulation of Surface Water,
W82-02623 5F

CHEMICAL COMPOSITION
Chemistry of a 7.5-M Sediment Core from Lake Valencia, Venezuela,
W82-02745 2H

Comparison of the Chemical Composition of the Waters of Lake Piaseczno (Leczynsko-Wlodawskie Lake District) and of the Shallow Ground Waters in Its Catchment Area,
W82-02752 2H

Effects of Short-Term Changes in Rain Water Supply on the Ionic Composition of Acid Moorland Pools in the Campine of Antwerp (Belgium),
W82-02775 2H

CHEMICAL PROPERTIES
Hydrochemical Characteristics of the Stream Drwinka and Estimate of Its Self-Purification Ability,
W82-02750 5B

CHEMICAL REACTIONS
Iron and Manganese in Lake Vechten (The Netherlands): Dynamics and Role in the Cycle of Reducing Power,
W82-02864 2K

Kd's--Can They Be Used to Describe Reversible Ion Sorption Reactions in Contaminant Migration,
W82-02942 5B

CHESAPEAKE BAY
Physical Characterization of Extra-Chromosomal DNA in Chesapeake Bay Bacteria from Polluted and Non-Polluted Sites,
W82-02814 5B

Carbon Dioxide Assimilation, Photosynthetic Efficiency, and Respiration of a Chesapeake Bay Salt Marsh,
W82-02937 2L

CHICAGO
A Dynamic Program for Coagulation and Filtration at Chicago's Jardine Water Treatment Plant,
W82-02731 5F

CHLORINATED HYDROCARBONS
Aquifer Decontamination for Volatile Organics: A Case History,
W82-02613 5F

CHLORINATION
Wastewater Treatment with Powdered Activated Carbon,
W82-02642 5D

Chlorine Dioxide for Wastewater Disinfection: A Feasibility Evaluation,
W82-02989 5D

CHLORINE
Kinetics of Monochloramine Decomposition in the Presence of Bromide,
W82-02651 5B

Bacteria from a Suspended Growth System as Organic Precursors to the Formation of Trihalomethanes,
W82-02806 5F

CHLORINE DIOXIDE
Chlorine Dioxide for Wastewater Disinfection: A Feasibility Evaluation,
W82-02989 5D

CHLOROFORM
Removing Trace Organics from Drinking Water Using Activated Carbon and Polymeric Adsorbents,
W82-02987 5F

CHLOROPHYLL
Plankton Studies in San Francisco Bay. I. Chlorophyll Distributions and Hydrographic Properties of the San Francisco Bay Estuary, July 1977 - December 1979,
W82-02831 2L

CHLOROPHYLL A
Studies on the Primary Production of the River Shatt Al-Arab at Basrah, Iraq,
W82-02776 5C

CHOWAN RIVER
Nitrogen Recycling in a North Carolina Coastal River,
W82-02822 5B

CHROMATES
A New Method of Regeneration of Anion Exchangers Used For Recovering Chromates from Wastewater,
W82-02723 5D

CHURCHILL COUNTY
Reconnaissance of the Hot Springs Mountains and Adjacent Areas, Churchill County, Nevada,
W82-02830 1A

CIRCULATION
Modeling Circulation in Depth-Averaged Flow,
W82-02679 2E

CLAYS
Computing the Settlement of Thin Antiseepage Walls Formed from Clayey Soils,
W82-02692 8D

CLEVELAND BAY
Seasonal Salinity Variations in Cleveland Bay, Northern Queensland,
W82-02878 2L

CLOSED-CONDUIT FLOW
Modeling Cavitation for Closed Conduit Flow,
W82-02700 8B

COAGULANTS
Prevention of Putrefaction in Organic Sludge by Co-Precipitation of Bactericide and Coagulant,
W82-02717 5D

COAGULATION
Chemical Coagulation of Surface Water,
W82-02623 5F

A Dynamic Program for Coagulation and Filtration at Chicago's Jardine Water Treatment Plant,
W82-02731 5F

COAL GASIFICATION
Management of Ground Water Contaminated by Aromatic Hydrocarbons in the Aquifer Supplying Ames, Iowa,
W82-02611 5B

A Chironomus Tentans Bioassay for Testing Synthetic Fuel Products and Effluents, with Data on Acridine and Quinoline,
W82-02630 5C

COAL MINING
Hydrologic Evaluation of a Hypothetical Coal-Mining Site Near Chrisney, Spencer County, Indiana,
W82-02840 6B

COASTAL STREAMS
Nitrogen Recycling in a North Carolina Coastal River,
W82-02822 5B

COASTAL WATERS
Secondary Treatment Waivers Issued, Controversy Continues,
W82-02652 6E

On the Role of Underwater Parks and Sanctuaries in the Management of Coastal Resources in the Southeastern United States,
W82-02905 5G

COASTAL ZONE MANAGEMENT
On the Role of Underwater Parks and Sanctuaries in the Management of Coastal Resources in the Southeastern United States,
W82-02905 5G

COHESIVE SOILS
Erosion Resistance of Cohesive Soils,
W82-02676 2J

COLIFORMS
Obtaining High-Level Wastewater Disinfection with Ozone,
W82-02706 5D

The Distribution and Seasonal Fluctuations of Heterotrophic Bacteria and Coliform Bacteria in the Rivers and Estuaries in Osaka City, Japan (In Japanese),
W82-02774 5A

Ultraviolet Disinfection of a Secondary Wastewater Treatment Plant Effluent,
W82-02985 5D

COLOR REMOVAL
Field Report on a Nonpolluting Bleach Plant,
W82-02793 5D

COLORADO
Results of Fisheries Investigations at Twin Lakes, Colorado: 1973-76,
W82-02984 6G

COLORADO RIVER
Summary; Lower Colorado River Recreation Research, 1974-1980,
W82-02976 6B

COMPACTION
Impulse Technology for Surface Compaction of Concrete Mixes in Construction of Slope Revetments,
W82-02695 8B

COMPARISON STUDIES
Runoff and Pollution Abatement Characteristics of Concrete Grid Pavements,
W82-02801 5B

COMPUTER MODELS
Urban Catchment Models: A Brief Examination,

W82-02609 8B

FLOW MEASUREMENT
Infiltration/Inflow Source Identification by Comprehensive Flow Monitoring,
W82-02674 5D

Discharge Characteristics of Triangular-Notch Thin-Plate Weirs,
W82-02842 8B

FLOW PATTERN
Ice Cover Effects on Stream Flows and Mixing,
W82-02698 2C

FLOW RATES
Local Flow Accelerations in Rivers,
W82-02758 2E

Low-Flow Frequency Data for Selected Stream-Gaging Stations in Florida,
W82-02834 2E

FLOW REGULATORS
New Jet-Gate Design,
W82-02691 8C

FLOW RESISTANCE
Flow Resistance in Coarse Gravel Bed Rivers,
W82-02879 2J

FLOW VELOCITY
Channel Form and Flow Characteristics of Supraglacial Streams, Austre Okstindbreen, Norway,
W82-02787 2E

FLUCTUATIONS
An Analysis of Areal Infiltration Considering Spatial Variability,
W82-02927 2G

FLUIDIZED BED PROCESS
Predicting Reactor Biomass Concentration in a Fluidized-Bed System,
W82-02932 5D

FLUMES
Boundary Shear in Smooth and Rough Channels,
W82-02711 8B

FLUORESCENCE
Fluorescence Spectra of Water-Soluble Humic Materials and Some Potential Precursors,
W82-02648 2K

FLUORIDE
The Equilibrium Fluoride Capacity of Activated Alumina,
W82-02968 5F

Inorganic Contaminant Removal from Drinking Water by Reverse Osmosis,
W82-02969 5F

FOAMING
Origin and Chemical Composition of Androscoggin River Foam,
W82-02970 5B

FOOD-PROCESSING WASTES
Overland Flow Treatment of Poultry Processing Wastewater in Cold Climates,
W82-02992 5D

FORECASTING
Demand Forecasting in Water Supply Networks,
W82-02926 6D

FOREST HYDROLOGY
Stomatal Response to Environmental Variables in Two Tropical Forest Species During the Dry Season in Nigeria,
W82-02884 2D

FOREST MANAGEMENT
The Reed Affair: A Canadian Logging and Pollution Controversy,
W82-02605 6B

FOREST WATERSHEDS
Role of Organic Debris Dams in Regulating the Export of Dissolved and Particulate Matter from a Forested Watershed,
W82-02653 4D

FOUNDATION ROCKS
Geotechnical Investigations at the Kalyani Dam Site, Chittoor District, Andhra-Pradesh India,
W82-02890 8E

FRANCE
French Experience in Water Pollution Control,
W82-02765 5G

Radiocarbon Dating of Groundwater of the Aquifer Confined in the Lower Triassic Sandstones of the Lorraine Region, France,
W82-02877 2F

The Microfauna of Activated Sludges. Study of an Observation Method and Application to Monitor a Pilot Plant During the Start-Up Phase. (La Microfauna Des Boues Activees. Etude D'une Methode D'Observation Et Application Au Suivi D'un Pilote En Phase De Demarrage,
W82-02960 5D

FRASER RIVER CATCHMENT
Regionalization and Prediction of Annual Floods in the Fraser River Catchment, British Columbia,
W82-02910 2E

FREQUENCY ANALYSIS
Flow Duration at Selected Stream-Sites in Kentucky,
W82-02837 2E

FREQUENCY DISTRIBUTION
An Analysis of Areal Infiltration Considering Spatial Variability,
W82-02927 2G

FRESHWATER MARSHES
Estimation of the Economic Value of Wetlands: Methodology and Application to Southeastern Michigan.
W82-02804 6B

FRICTION
Calculation of the Strength of Rigid Diaphragms in Earth Dams,
W82-02667 8D

FRICTION LOSS
Flow Resistance in Coarse Gravel Bed Rivers,
W82-02879 2J

Coefficient of Friction in Conduits with Large Roughness,
W82-02901 8B

FUEL REPROCESSING
The Status of Nuclear Waste Management,
W82-02659 5E

FUNGI
Occurrence, Distribution and Seasonal Periodicity of Some Aquatic Fungi of Sat-Tal (Nainital), India,
W82-02894 2H

FUNKA BAY
A Sediment Trap Experiment in Funka Bay, Japan: 'Upward Flux' of Particulate Matter in Seawater,
W82-02893 2K

FUTURE PLANNING
Computer Modeling of Flood Alleviation Benefits,
W82-02957 6B

GAMMARUS
Production of Gammarus Lacustris (Amphipoda, Gammaridae) in Lake Sevan,
W82-02781 2H

GAS CHROMATOGRAPHY
Determination of Phthalates in Industrial and Municipal Wastewaters,
W82-02999 5A

GATES
New Jet-Gate Design,
W82-02691 8C

GEOCHEMISTRY
Multivariate Analysis and Geochemical Interpretation of Spatial Variability of the Water Quality of Southern Quebec Rivers. (Analyse Multivariee et Interpretation Geochimique de la Variabilite Spatiale de la Qualite de l'Eau Des Rivieres Du Quebec Meridional),
W82-02662 2K

A Geochemical Method of Determining Dispersivity in Regional Groundwater Systems,
W82-02941 2F

GEOHYDROLOGY
Reconnaissance of the Hot Springs Mountains and Adjacent Areas, Churchill County, Nevada,
W82-02830 1A

GEOLOGIC FORMATIONS
Outflow of Volcanic Rock and Gas During Opening of the Arpa-Sevan Tunnel,
W82-02772 2A

GEOLOGIC FRACTURES
Reconnaissance of the Hot Springs Mountains and Adjacent Areas, Churchill County, Nevada,
W82-02830 1A

GEOLOGIC HISTORY
Chemistry of a 7.5-M Sediment Core from Lake Valencia, Venezuela,
W82-02745 2H

GEORGIA
The Response of Macroinvertebrates to Aquatic Macrophyte Decomposition,
W82-02664 2H

GEOTHERMAL RESOURCES
Boise Looks Underground for Heat.
W82-02636 2F

GEOTHERMAL STUDIES
Reconnaissance of the Hot Springs Mountains and Adjacent Areas, Churchill County, Nevada,
W82-02830 1A

GERMANY
Water Pollution Control in the Federal Republic of Germany,
W82-02766 6E

The Relation Between 'Hydraulic Stress' and Microdistribution of Benthic Macroinvertebrates in a Lowland Running Water System, the Schierenseebroks (North Germany),
W82-02790 5C

GHANA
Periphyton in the Volta Lake. I. Seasonal Changes on the Trunks of Flooded Trees,
W82-02882 2H

Periphyton in the Volta Lake. II. Seasonal Changes on Wooden Blocks with Depth,
W82-02883 2H

GLACIAL AQUIFERS
Geoelectric Soundings for Predicting Aquifer Properties,
W82-02619 2F

GLACIAL STREAMS
Channel Form and Flow Characteristics of Supraglacial Streams, Austre Okstindbreen, Norway,
W82-02787 2E

GLACIER MASS BALANCE
The Mass Balance of Peyto Glacier, Alberta, Canada, 1965 to 1978,
W82-02638 2C

GLACIOHYDROLOGY
The Mass Balance of Peyto Glacier, Alberta, Canada, 1965 to 1978,
W82-02638 2C

GRAZING
Resource Allocation in a Sierra-Nevada Foothill Beef Cow-Calf Operation Through Linear Programming,
W82-02809 3F

GREAT LAKES
Farm, Urban Drainage Polluting Great Lakes.
W82-02647 5B

Screen Mesh Size Affects Estimates of Macro- and Meio-Benthos Abundance and Biomass in the Great Lakes,
W82-02912 2H

GREECE
Some Hydrobiological Characteristics in Amvrakia Lake, Western Greece,
W82-02753 2H

GROUNDWATER
The Effects of Urbanization on Small Watersheds and Groundwater,
W82-02738 5C

Groundwater Systems Associated with Secondary Salinity in Western Australia.
W82-02770 2F

Geology and Water Availability of Dallas County, Alabama,
W82-02833 6D

Digital-Model Simulation of the Hydrologic Flow System, with Emphasis on Ground Water, in the Spokane Valley, Washington and Idaho,
W82-02836 2F

Ground-Water Appraisal of Sand Plains in Benton, Sherburne, Stearns, and Wright Counties, Central Minnesota,
W82-02838 2F

Potentiometric Surface Maps of the Sparta Sand: Northern Louisiana and Southern Arkansas, 1900, 1965, 1975, and 1980,
W82-02839 2F

Hydrologic Evaluation of a Hypothetical Coal-Mining Site Near Chrisney, Spencer County, Indiana,
W82-02840 6B

Water Resources Data for Wyoming, Water Year 1980--Volume 1. Missouri River Basin.
W82-02846 7C

Water Resources Data for Mississippi, Water Year 1980.
W82-02847 7C

Uranium Isotopes and 226Ra Content in the Deep Groundwaters of the Tri-State Region, U.S.A.,
W82-02939 5A

GROUNDWATER AVAILABILITY
Ground-Water Appraisal of Sand Plains in Benton, Sherburne, Stearns, and Wright Counties, Central Minnesota,
W82-02838 2F

Preparation of Friable Aquiferous Specimens,
W82-02955 2F

GROUNDWATER DATING
Radiocarbon Dating of Groundwater of the Aquifer Confined in the Lower Triassic Sandstones of the Lorraine Region, France,
W82-02877 2F

GROUNDWATER LEVEL
Supplement to Predictive Modeling of Effects of the Planned Kindred Lake on Ground-Water Levels and Discharge, Southeastern North Dakota,
W82-02828 4A

Probable High Ground-Water Levels in Massachusetts,
W82-02829 2F

GROUNDWATER MANAGEMENT
A Preliminary Survey of State Ground-Water Laws,
W82-02616 6E

An Economic Analysis of Ground Water Management Alternatives,
W82-02740 4B

Managing Crisis: The Effectiveness of Local Districts for Control of Ground Water Mining,
W82-02819 4B

Method of Constructing a System for Controlling Regional Exploitable Groundwater Resources,
W82-02849 4B

Scientific and Technical Aspects of the Rational Use and Conservation of Groundwaters in the Ukrainian SSR,
W82-02852 4B

Injection, Recharge and Return Wells,
W82-02920 4B

GROUNDWATER MINING
Managing Crisis: The Effectiveness of Local Districts for Control of Ground Water Mining,
W82-02819 4B

GROUNDWATER MOVEMENT
Integral Equation Formulation for Ground-Water Flow,
W82-02716 2F

Digital-Model Simulation of the Hydrologic Flow System, with Emphasis on Ground Water, in the Spokane Valley, Washington and Idaho,
W82-02836 2F

An Analysis of Areal Infiltration Considering Spatial Variability,
W82-02927 2G

A Geochemical Method of Determining Dispersivity in Regional Groundwater Systems,
W82-02941 2F

GROUNDWATER POLLUTION
Management of Ground Water Contaminated by Aromatic Hydrocarbons in the Aquifer Supplying Ames, Iowa,
W82-02611 5B

Aquifer Decontamination for Volatile Organics: A Case History,
W82-02613 5F

Impact of Dredged Material Disposal upon Ground-Water Quality,
W82-02615 5B

Field Investigation of Contaminant Loss from Chemically Stabilized Industrial Sludges.
W82-02990 5B

GROUNDWATER POTENTIAL
Scientific and Technical Aspects of the Rational Use and Conservation of Groundwaters in the Ukrainian SSR,
W82-02852 4B

GROUNDWATER RECHARGE
Ground-Water Recharge from Rectangular Areas,
W82-02791 2F

Water Reclamation by the Use of Soil-Turfgrass Systems in the Southwest USA,
W82-02817 3C

Effect of Irrigation on Groundwater Resources with Special Reference to the Vakhsh Valley,
W82-02851 2A

Injection, Recharge and Return Wells,
W82-02920 4B

GROUTING
Use of Crack-Resistant Linings of Hydraulic Tunnels with Consolidation Grouting of the Rock,
W82-02670 8A

Experience in the Construction and First Years of Operation of the Zeya Dam,
W82-02952 8A

GUADALUPE MOUNTAINS NATIONAL PARK
Effects of Recreation on Water Quality in Guadalupe Mountains National Park,
W82-02821 5B

HALOGENATED HYDROCARBONS
Sources of Halogenated Hydrocarbons in an Urban Water Supply,
W82-02991 5B

HALOGENATED PESTICIDES
Sources of Halogenated Hydrocarbons in an Urban Water Supply,
W82-02991 5B

HAWAII
Response of Subtropical Phytoplankton to Power Plant Entrainment,
W82-02708 5C

Physicochemical Influences on Phytoplankton Production in a Tropical Alpine Lake,
W82-02921 2H

HEAT TRANSFER
Influence of Heat Dispersion on Steady Convection in Anisotropic Porous Media,
W82-02924 2F

HEAT TREATMENT
Pilot-Scale Anaerobic Filter Treatment of Heat Treatment Liquor,
W82-02972 5D

HEATED WATER
Effects of Hydrological and Biological Variables on the Survival, Growth, and Food Utilization of Estuarine Fishes Cage-Cultured in a Heated Water System,
W82-02730 5C

HEATING
Boise Looks Underground for Heat.
W82-02636 2F

HEAVY METALS
Trace Metal Concentrations in Oxidation Ponds,
W82-02703 5D

Forms of Heavy Metals in the Settling Matter from a Man Made Lake (In Japanese),
W82-02719 5B

Studies on the Acute Toxicity of Some Heavy Metals to an Indian Freshwater Pond Snail Viviparus Bengalensis L.,
W82-02789 5C

Characterization of Boliden's Sulfide-Lime Precipitation System,
W82-02988 5D

HENEY LAKE
Spatial and Temporal Overlap in Lake Phytoplankton Communities,
W82-02610 2H

HIGH ASWAN DAM
Technical and Ecological Impacts of the High Aswan Dam,
W82-02856 4A

HUMIC ACIDS
Fluorescence Spectra of Water-Soluble Humic Materials and Some Potential Precursors,
W82-02648 2K

HUNGARY
The Use of Dialyzing Sacks in Estimation of Production of Bacterioplankton and Phytoplankton,
W82-02866 7B

HYDRAULIC CONDUCTIVITY
A Method of Performing Response Tests on Highly Permeable Aquifers,
W82-02916 2F

HYDRAULIC ENGINEERINGS
Stages of Progress in the Organization of Hydraulic Construction,
W82-02858 8A

HYDRAULIC GATES
New Jet-Gate Design,
W82-02691 8C

Prospects of Using Radial Gates on Overflow Dams of Large Hydroelectric Stations,
W82-02693 8A

HYDRAULIC STRUCTURES
Rational Dimensions of an Earth Blanket and Its Seepage Calculation,
W82-02666 8A

The Effect of Wind on Ice Pressure on River Structures,
W82-02668 2C

Improvement of the Seals of Expansion Joints of Hydraulic Structures,
W82-02669 8A

HYDRAULICS
Application of Reliability Theory to Hydraulic Engineering Design,
W82-02699 8B

Discharge Characteristics of Triangular-Notch Thin-Plate Weirs,
W82-02842 8B

HYDROBIOLOGY
Some Hydrobiological Characteristics in Amvrakia Lake, Western Greece,
W82-02753 2H

HYDROELECTRIC PLANTS
Prospects of Using Radial Gates on Overflow Dams of Large Hydroelectric Stations,
W82-02693 8A

Construction of a Basic-Gate Unit for the Deep Catastrophic Sluice at the Nurek Hydroelectric Plant,
W82-02771 8A

On-Site Investigations of the Contact Zone of the Upstream Face of the Concrete Dam on the Ust-Ilim Hydroelectric Station,
W82-02773 8A

Study of the Experience in Operating Hydraulic Tunnels,
W82-02782 8A

Scroll Casings of Steel and Reinforced-Concrete Construction,
W82-02784 8G

Environmental Implications and Assessments of Hydroelectric Projects,
W82-02896 6G

Experience with and the Effectiveness of Automatic Systems for Control of Loading-Hauling Operations During Construction of the Dam for Nurek Hydroelectric Plant,
W82-02948 8A

Construction of the Diversion Pressure Tunnel of the Inguri Hydroelectric Station,
W82-02949 8A

Progressive Solutions in the Design of Under-Ground Structures for the Rogun Hydroelectric Plant,
W82-02950 8A

Closure of the Kama River at the Site of the Lower Kama Hydroelectric Plant,
W82-02951 8A

Experience in the Construction and First Years of Operation of the Zeya Dam,
W82-02952 8A

Water Resources Appraisals for Hydroelectric Licensing: Alaska River Basins, Alaska,
W82-02975 6D

HYDROELECTRIC POWER
The Environmental Effects of Hydroelectric Projects,
W82-02632 6G

Argentina's Hydroelectric-Based Energy Plan,
W82-02794 8A

HYDROGEN ION CONCENTRATION
The Prediction of Rain Acidity and SO2 Scavenging in Eastern North America,
W82-02628 5B

HYDROGRAPH ANALYSIS
Analysis of Flood Hydrographs from Wetland Areas,
W82-02733 2A

HYDROGRAPHS
Approximate Error Bounds for Simulated Hydrographs,
W82-02678 2A

HYDROLOGIC BALANCE
Effect of Irrigation on Groundwater Resources with Special Reference to the Vakhsh Valley,
W82-02851 2A

HYDROLOGIC BUDGET
The Mass Balance of Peyto Glacier, Alberta, Canada, 1965 to 1978,
W82-02638 2C

HYDROLOGIC DATA
Miscellaneous Surface-Water Data, Pecos River Basin, New Mexico,
W82-02827 7C

Drainage Areas of Streams at Selected Locations in Kentucky,
W82-02835 7C

Hydrologic Evaluation of a Hypothetical Coal-Mining Site Near Chrisney, Spencer County, Indiana,
W82-02840 6B

Water Resources Data for Alaska, Water Year 1980,
W82-02845 7C

Water Resources Data for Wyoming, Water Year 1980--Volume 1. Missouri River Basin,
W82-02846 7C

Water Resources Data for Mississippi, Water Year 1980,
W82-02847 7C

Construction of a Gamma-Distribution Probability Paper for Straightening Discharge Probability Curves,
W82-02925 7B

HYDROLOGIC MODELS
On Modeling the Turbulent Transport of Passive Biological Variables in Aquatic Ecosystems,
W82-02661 2L

Urban Catchment Models: A Brief Examination,
W82-02813 4C

Evaluation of Remote Sensing Data for Input into Hydrological Simulation Program-Fortran (HSPF),
W82-02986 7B

HYDROSTATIC PRESSURE
Design and Development of an Automated Hydrostatic Flexible Membrane Test Facility,
W82-02978 8G

HYDROXYBENZYLMETHANESULFONATE
The Effect of Alpha-Hydroxybenzylmethanesulfonate on Photosynthesis and Excretion of Chlorella and Natural Phytoplankton in a Lake,
W82-02918 5C

ICE BREAKUP
A Solution to Spring Ice-Jam Flooding,
W82-02908 2C

ICE COVER
Ice Cover Effects on Stream Flows and Mixing,
W82-02698 2C

Production Strategies in Antarctic Inland Waters: Phytoplankton Eco-Physiology in a Permanently Ice-Covered Lake,
W82-02862 2C

ICE JAMS
A Solution to Spring Ice-Jam Flooding,
W82-02908 2C

ICE PRESSURE
The Effect of Wind on Ice Pressure on River Structures,
W82-02668 2C

ICED LAKES
The Production Ecology of Benthic Plants in Some Antarctic Lakes. II. Laboratory Physiology Studies,
W82-02861 2H

IDAHO
Digital-Model Simulation of the Hydrologic Flow System, with Emphasis on Ground Water, in the Spokane Valley, Washington and Idaho,
W82-02836 2F

INDIA
Water Supply and Sanitation Decade Programme,
W82-02757 5F

Water for Industry,
W82-02767 6D

Studies on the Acute Toxicity of Some Heavy Metals to an Indian Freshwater Pond Snail Viviparus Bengalensis L.,
W82-02789 5C

Multiobjective Analysis of Irrigation Planning in River Basin Development,
W82-02855 6A

Geotechnical Investigations at the Kalyani Dam Site, Chittoor District, Andhra-Pradesh India,
W82-02890 8E

Occurrence, Distribution and Seasonal Periodicity of Some Aquatic Fungi of Sat-Tal (Nainital), India,
W82-02894 2H

INDIANA
Hydrologic Evaluation of a Hypothetical Coal-Mining Site Near Chrisney, Spencer County, Indiana,
W82-02840 6B

INDUSTRIAL WASTES
Aquifer Decontamination for Volatile Organics: A Case History,
W82-02613 5F

Hydrochemical Characteristics of the Stream Drwinka and Estimate of Its Self-Purification Ability,
W82-02750 5B

Flue Gas Desulfurization Sludge Disposal Practices for Coal-Fired Steam and Power Plants,
W82-02907 5E

Field Investigation of Contaminant Loss from Chemically Stabilized Industrial Sludges,
W82-02990 5B

INDUSTRIAL WASTEWATER
Spiral Classifiers Help One Manufacturer Meet Environmental Standards More Easily,
W82-02602 5D

By-Product Recovery Finances Treatment,
W82-02756 5D

New Developments in Papermaking in Western Europe,
W82-02947 5D

Reduction of Toxicity to Aquatic Organisms by Industrial Wastewater Treatment,
W82-02971 5C

Characterization of Boliden's Sulfide-Lime Precipitation System,
W82-02988 5D

Wood Preserving Industry Multimedia Emission Inventory,
W82-02993 5D

Determination of Phthalates in Industrial and Municipal Wastewaters,
W82-02999 5A

Nickel Recovery from Electroplating Rinsewaters by Electrodialysis,
W82-03000 5D

INDUSTRIAL WASTEWATERS
Fate of Toxic and Nonconventional Pollutants in Wastewater Treatment Systems Within the Pulp, Paper, and Paperboard Industry,
W82-02998 5D

INDUSTRIAL WATER
Method and Apparatus for Supplying Dissolved Chemicals into Water,
W82-02625 5F

INFILTRATION
An Analysis of Areal Infiltration Considering Spatial Variability,
W82-02927 2G

INGURI RIVER
Construction of the Diversion Pressure Tunnel of the Inguri Hydroelectric Station,
W82-02949 8A

INJECTION WELLS
Aquifer Thermal Energy Storage: A Numerical Simulation of Auburn University Field Experiments,
W82-02919 4B

INSECTICIDES
The Clear Lake Example: An Ecological Approach to Pest Management,
W82-02660 5F

INSPECTION
Study of the Experience in Operating Hydraulic Tunnels,
W82-02782 8A

INTAKES
Use of Fish Larva Morphometry to Predict Exclusion Capabilities of Small-Mesh Screens at Cooling-Water Intakes,
W82-02687 8I

The Schooling Mechanism of Young Perch (Perca Fluviatilis) in the Open Part of Lake-Type Reservoirs (As Exemplified by Rybinsk Reservoir),
W82-02954 2H

INTERCEPTION
Vertical Variation in Stemflow Generation,
W82-02959 2I

IODINE
Dissolved Iodine Flux from Estuarine Sediments and Implications for the Enrichment of Iodine at the Sediment Water Interface,
W82-02656 2K

ION EXCHANGE
Field Report on a Nonpolluting Bleach Plant,
W82-02793 5D

Evaluation of Ion Exchange Technology for Toxic and Non-Conventional Pollutant Reduction in Bleach Plant Effluents,
W82-02967 5D

IRAQ
Studies on the Primary Production of the River Shatt Al-Arab at Basrah, Iraq,
W82-02776 5C

On the Algal Ecology of the Lowland Iraqi Marshes,
W82-02777 6G

IRON
Determination of the Solubility of Ferrous Sulfide in a Seasonally Anoxic Marine Basin,
W82-02665 2K

Iron and Manganese in Lake Vechten (The Netherlands): Dynamics and Role in the Cycle of Reducing Power,
W82-02864 2K

IRON COMPOUNDS
Kinetics and Product of Ferrous Iron Oxygenation in Aqueous Systems,
W82-02923 2K

IRRIGATION
An Economic Analysis of Water Resources Development in Deltaic Regions of Asia: The Case of Central Thailand,
W82-02735 6D

Water Management in the North Deschutes Unit Irrigation District: Geographic Perspectives and Remote Sensing Applications,
W82-02739 7B

IRRIGATION DITCHES
Water Levels and Losses and Cleaning in Watercourses,
W82-02747 3F

IRRIGATION EFFECTS
Planting Date and Water Deficit Effects on Development and Yield of Irrigated Winter Wheat,
W82-02607 3F

Effect of Irrigation on Groundwater Resources with Special Reference to the Vakhsh Valley,
W82-02851 2A

Technical and Ecological Impacts of the High Aswan Dam,
W82-02856 4A

Leaching of a Sorbed Solute: A Model for Peak Concentration Displacement,
W82-02922 5B

IRRIGATION EFFICIENCY
Response Functions of Crops Yield to Soil Moisture Stress,
W82-02725 3F

IRRIGATION PRACTICES
Multiobjective Analysis of Irrigation Planning in River Basin Development,
W82-02855 6A

The Irrigation Scheduling Problem and Evapotranspiration Uncertainty,
W82-02900 2D

IRRIGATION REQUIREMENTS
Influence of Irrigation Rhythm and Water Supply on Growth, Water Status and Yield of Egg-Plant (Solanum Melongena L.),
W82-02746 3F

ISOTOPE STUDIES
Uranium Isotopes and 226Ra Content in the Deep Groundwaters of the Tri-State Region, U.S.A.,
W82-02939 5A

JAMES RIVER
Detoxification of Chlorinated Sewage Effluent by Dechlorination in Estuarine Waters,
W82-02688 5C

JAPAN
Studies on the Seasonal Changes of Dissolved Organic Carbon, Nitrogen, Phosphorus and Urea Concentrations in Lake Biwa,
W82-02768 2H

The Distribution and Seasonal Fluctuations of Heterotrophic Bacteria and Coliform Bacteria in the Rivers and Estuaries in Osaka City, Japan (In Japanese),
W82-02774 5A

On the Sampling Size of Zoobenthos Along a Lake Shore (In Janpanese),
W82-02796 2H

Seasonal Change in Ciliate Populations in the Bottom Sediment of a Polluted River,
W82-02797 5C

Three Coastal Lakes on Kamikoshiki Island, Kagoshima Prefecture,
W82-02798 2H

Paleolimnology of Lake Kizaki,
W82-02863 2J

Slope Failures and Tailing Dam Damage in the 1978 Izu-Ohshima-Kinkai Earthquake,
W82-02891 8D

KALYANI DAM
Geotechnical Investigations at the Kalyani Dam Site, Chittoor District, Andhra-Pradesh India,
W82-02890 8E

KAMA RIVER
Closure of the Kama River at the Site of the Lower Kama Hydroelectric Plant,
W82-02951 8A

KANSAS
Legal Questions and Problems of Kansas Groundwater Management Districts,
W82-02802 6E

KARST HYDROLOGY
The Response of the Invertebrate Fauna to Organic Pollution in a Well Oxygenated Karst Stream Exemplified by the Pradnik Stream (South Poland),
W82-02751 5C

KENTUCKY
Low-Flow Characteristics of Kentucky Streams, 1980,
W82-02826 2E

Drainage Areas of Streams at Selected Locations in Kentucky,
W82-02835 7C

Flow Duration at Selected Stream-Sites in Kentucky,
W82-02837 2E

KINETICS
Kinetics of Trace Metal Partitioning in Model Anoxic Marine Sediments,
W82-02820 5B

Kinetics and Product of Ferrous Iron Oxygenation in Aqueous Systems,
W82-02923 2K

LAKE BALATON
The Use of Dialyzing Sacks in Estimation of Production of Bacterioplankton and Phytoplankton,
W82-02866 7B

LAKE BLANKVATN
Cyclops Scutifer Sars - One and Two-Year Life Cycles with Diapause in the Meromictic Lake Blankvatn,
W82-02865 2H

LAKE DECATUR WATERSHED
Ecological Magnification of Persistent Organochlorine Pesticides in an Illinois Watershed,
W82-02741 5A

LAKE FISHERIES
Observations on Some Common Parasites of Bagrus Docmac Forskahl (Pisces: Siluroidea) of Lake Victoria,
W82-02887 2H

Results of Fisheries Investigations at Twin Lakes, Colorado; 1973-76,
W82-02984 6G

LAKE HANCOCK
Hydrologic Description of Lake Hancock, Polk County, Florida,
W82-02843 2H

LAKE HARUNA
On the Sampling Size of Zoobenthos Along a Lake Shore (In Janpanese),
W82-02796 2H

LAKE KAIIKE
Three Coastal Lakes on Kamikoshiki Island, Kagoshima Prefecture,
W82-02798 2H

LAKE KIZAKI
Paleolimnology of Lake Kizaki,

OPERATING COSTS
Operation Reports: East Bay Municipal District (SD No 1), California.
W82-02707 5D

OPERATION AND MAINTENANCE
Cost Estimates for Water Treatment Plant Operation and Maintenance.
W82-02697 6C

OPTICAL PROPERTIES
Detection of Oil Pollutants on the Surface of Inland Waters by a Projector-Based Optical Detector,
W82-02853 5A

OREGON
Water Management in the North Deschutes Unit Irrigation District: Geographic Perspectives and Remote Sensing Applications,
W82-02739 7B

ORGANIC CARBON
Recommendations for Regulatory Modifications: The Use of Waste Stabilization Pond Systems,
W82-02675 5D

Studies on the Seasonal Changes of Dissolved Organic Carbon, Nitrogen, Phosphorus and Urea Concentrations in Lake Biwa,
W82-02768 2H

Recent Inshore Sediments in Musandam, Oman,
W82-02857 2J

ORGANIC COMPOUNDS
Application of Adsorption to Wastewater Treatment,
W82-02622 5D

Separation of Toxic Organotin Compounds from Aqueous Solution by Adsorption,
W82-02641 5D

Transfer of Volatile Substances from Water to the Atmosphere,
W82-02902 1B

Adsorption of Dissolved Organics in Lake Water by Aluminum Oxide. Effect of Molecular Weight,
W82-02940 5F

Wood Preserving Industry Multimedia Emission Inventory,
W82-02993 5D

ORGANIC MATTER
Forms of Heavy Metals in the Settling Matter from a Man Made Lake (In Japanese),
W82-02719 5B

Allochthonous Plant Litter as a Source of Organic Material in an Oligotrophic Lake (Llyn Frongoch),
W82-02778 2H

ORGANIC PRECURSORS
Bacteria from a Suspended Growth System as Organic Precursors to the Formation of Trihalomethanes,
W82-02806 5F

ORGANIC WASTES
The Response of the Invertebrate Fauna to Organic Pollution in a Well Oxygenated Karst Stream Exemplified by the Pradnik Stream (South Poland),
W82-02751 5C

OVERLAND FLOW
Overland Flow Treatment of Poultry Processing Wastewater in Cold Climates,
W82-02992 5D

Nitrogen and Phosphorus Reactions in Overland Flow of Wastewater,
W82-02996 5D

OXIDATION
Kinetics and Product of Ferrous Iron Oxygenation in Aqueous Systems,
W82-02923 2K

OXIDATION PONDS
Trace Metal Concentrations in Oxidation Ponds,
W82-02703 5D

OZONATION
Ozone Water Treatment,
W82-02682 5F

Obtaining High-Level Wastewater Disinfection with Ozone,
W82-02706 5D

P-CHLOROPHENOL
Comparative Performance of Synthetic Adsorbents and Activated Carbon for Specific Compound Removal from Wastewaters,
W82-02702 5D

P-TOLUENE SULFONATE
Comparative Performance of Synthetic Adsorbents and Activated Carbon for Specific Compound Removal from Wastewaters,
W82-02702 5D

PALEOLIMNOLOGY
Paleolimnology of Lake Kizaki,
W82-02863 2J

Post-Glacial Sediments in Lake Linnevatn, Spitsbergen,
W82-02869 2H

PALM OIL
By-Product Recovery Finances Treatment,
W82-02756 5D

PARASITES
Observations on Some Common Parasites of Bagrus Docmac Forskahl (Pisces: Siluroidea) of Lake Victoria,
W82-02887 2H

PARKS
On the Role of Underwater Parks and Sanctuaries in the Management of Coastal Resources in the Southeastern United States,
W82-02905 5G

PARTICLE SIZE
Settling Velocity of Spherical Particles in Calm Water,
W82-02958 1B

PATENTS
Method and Apparatus for Supplying Dissolved Chemicals into Water,
W82-02625 5F

PATH OF POLLUTANTS
Plutonium Occurrence and Phase Distribution in Sediments of the Wyre Estuary, Northwest England,
W82-02760 5B

Kd's--Can They Be Used to Describe Reversible Ion Sorption Reactions in Contaminant Migration,
W82-02942 5B

PAVEMENT
Runoff and Pollution Abatement Characteristics of Concrete Grid Pavements,
W82-02801 5B

PECOS RIVER BASINS
Miscellaneous Surface-Water Data, Pecos River Basin, New Mexico,
W82-02827 7C

PENFIELD
The Effects of Urbanization on Small Watersheds and Groundwater,
W82-02738 5C

PENIKESE ISLAND
The Freshwater and Brackish-Water Diatoms of Penikese Island, Massachusetts: 1923-1973,
W82-02696 2H

PENNSYLVANIA
Fluorescence Spectra of Water-Soluble Humic Materials and Some Potential Precursors,
W82-02648 2K

PERCH
The Schooling Mechanism of Young Perch (Perca Fluviatilis) in the Open Part of Lake-Type Reservoirs (As Exemplified by Rybinsk Reservoir),
W82-02954 2H

PERFORMANCE EVALUATION
Improvement of the Seals of Expansion Joints of Hydraulic Structures,
W82-02669 8A

Methods for Evaluating Performance of Filter Media,
W82-02684 5D

PERIPHYTON
Periphyton in the Volta Lake. I. Seasonal Changes on the Trunks of Flooded Trees,
W82-02882 2H

Periphyton in the Volta Lake. II. Seasonal Changes on Wooden Blocks with Depth,
W82-02883 2H

PESTICIDES
Ecological Magnification of Persistent Organochlorine Pesticides in an Illinois Watershed,
W82-02741 5A

PETROLEUM PRODUCTS
Development of a Multidetector Petroleum Oil-In-Water Monitor,
W82-02964 5A

PEYTO GLACIER
The Mass Balance of Peyto Glacier, Alberta, Canada, 1965 to 1978,
W82-02638 2C

PHENOLS
Effect of N-Benzoquinone and of Some Polyphenols on the Membrane Potential of Nitella Sp. Measured by the Open-Vacuole Method,
W82-02626 5C

PHOSPHORIC ACID
Water-Phosphoric Acid Media: Electrochemical Properties,
W82-02943 1B

PHOSPHOROUS ABSORPTION
Absorption by Chlorella Vulgaris Beijer. of Phosphorus Compounds Released by the Submerged Macrophyte Potamogeton Pectinatus L.,
W82-02780 2H

PHOSPHORUS
Absorption by Chlorella Vulgaris Beijer. of Phosphorus Compounds Released by the Submerged Macrophyte Potamogeton Pectinatus L.,
W82-02780 2H

Comparison of Statistical Phosphorus-Retention Models,
W82-02930 5G

PHOSPHORUS REMOVAL
Reduced Energy Usage with Biological Phosphorus Removal,
W82-02705 5D

Nitrogen and Phosphorus Reactions in Overland Flow of Wastewater,
W82-02996 5D

PHOTOSYNTHESIS
The Production Ecology of Benthic Plants in Some Antarctic Lakes. II. Laboratory Physiology Studies,
W82-02861 2H

PHTHALATES
Determination of Phthalates in Industrial and Municipal Wastewaters,
W82-02999 5A

PHYTOPLANKTON
Spatial and Temporal Overlap in Lake Phytoplankton Communities,
W82-02610 2H

Response of Subtropical Phytoplankton to Power Plant Entrainment,
W82-02708 5C

Effects of Whole Lake Mixing on Water Quality and Phytoplankton,
W82-02823 5C

Plankton Studies in San Francisco Bay. I. Chlorophyll Distributions and Hydrographic Properties of the San Francisco Bay Estuary, July 1977 - December 1979,
W82-02831 2L

Plankton Studies in San Francisco Bay. II. Phytoplankton Abundance and Species Composition, July 1977 - December 1979,
W82-02832 2L

Production Strategies in Antarctic Inland Waters: Phytoplankton Eco-Physiology in a Permanently Ice-Covered Lake,
W82-02862 2C

The Use of Dialyzing Sacks in Estimation of Production of Bacterioplankton and Phytoplankton,
W82-02866 7B

The Effect of Alpha-Hydroxybenzylmethanesulfonate on Photosynthesis and Excretion of Chlorella and Natural Phytoplankton in a Lake,
W82-02918 5C

Physicochemical Influences on Phytoplankton Production in a Tropical Alpine Lake,
W82-02921 2H

PILOT PLANTS
The Microfauna of Activated Sludges. Study of an Observation Method and Application to Monitor a Pilot Plant During the Start-Up Phase. (La Microfauna Des Boues Activees. Etude D'une Methode D'Observation Et Application Au Suivi D'un Pilote En Phase De Demarrage,
W82-02960 5D

PIPELINES
Selecting Pipelines to Achieve Effective Energy Conservation,
W82-02609 8B

PIPES
Galvanized Pipe Vies for Equal Alternative Status in Storm Sewer Projects,
W82-02601 8G

The Cost of Quality,
W82-02881 5F

Vinyl Lined Asbestos Cement Pipe Problems, Operator Aspects,
W82-02898 5B

PLANKTON
The Freshwater and Brackish-Water Diatoms of Penikese Island, Massachusetts: 1923-1973,
W82-02696 2H

Acoustic Reflection from Estuarine Pycnoclines,
W82-02722 2L

Pollution Effects on the Phytoplankton-Zooplankton Relationships in an Inshore Environment,
W82-02886 5C

PLANNING
Water Regulation in an Inflationary Environment,
W82-02701 5F

Robustness, Reliability, Resilience and Vulnerability Criteria for Planning Water Resources Systems,
W82-02737 6A

French Experience in Water Pollution Control,
W82-02765 5G

Cascaded Tradeoffs: A Multiple-Objective, Multiple-Publics Method for Alternatives Evaluation in Water Resources Planning,
W82-02980 6B

PLASMIDS
Physical Characterization of Extra-Chromosomal DNA in Chesapeake Bay Bacteria from Polluted and Non-Polluted Sites,
W82-02814 5B

PLUTONIUM
Plutonium Occurrence and Phase Distribution in Sediments of the Wyre Estuary, Northwest England,
W82-02760 5B

POLAND
Hydrochemical Characteristics of the Stream Drwinka and Estimate of Its Self-Purification Ability,
W82-02750 5B

The Response of the Invertebrate Fauna to Organic Pollution in a Well Oxygenated Karst Stream Exemplified by the Pradnik Stream (South Poland),
W82-02751 5C

Comparison of the Chemical Composition of the Waters of Lake Piaseczno (Leczynsko-Wlodawskie Lake District) and of the Shallow Ground Waters in Its Catchment Area,
W82-02752 2H

POLAROGRAPHIC ANALYSIS
Differential Pulse Polarographic Determination of Inorganic and Organic Arsenic in Natural Waters,
W82-02903 5A

POLITICAL ASPECTS
The Reed Affair: A Canadian Logging and Pollution Controversy,
W82-02605 6B

POLITICAL CONSTRAINTS
Current Policies on Land Application,
W82-02629 5E

POLLUTANT IDENTIFICATION
Concentration of Virus from Tap Water at Ambient Salt and pH Levels Using Positively Charged Filter Media,
W82-02712 5A

Volatile Organic Acids in Lake Water; Their Gas Chromatographic Determination and Ecological Significance,
W82-02720 5A

Ecological Magnification of Persistent Organochlorine Pesticides in an Illinois Watershed,
W82-02741 5A

Differential Pulse Polarographic Determination of Inorganic and Organic Arsenic in Natural Waters,
W82-02903 5A

Determination of Phthalates in Industrial and Municipal Wastewaters,
W82-02999 5A

POLYCHLORINATED BIPHENYLS
Biodegradation of Aroclor 1221 Type PCBs in Sewage Wastewater,
W82-02899 5D

Polychlorinated Biphenyls in Sewage Sludge and Sediments of the New York Bight,
W82-02904 5A

PONDS
The Freshwater and Brackish-Water Diatoms of Penikese Island, Massachusetts: 1923-1973,
W82-02696 2H

POOLS
Effects of Short-Term Changes in Rain Water Supply on the Ionic Composition of Acid Moorland Pools in the Campine of Antwerp (Belgium),
W82-02775 2H

POPULATION DYNAMICS
How Abiotic Factors Affect the Distribution of Two Species of Tropical Predaceous Aquatic Bugs (Family: Naucoridae),
W82-02633 7A

Production of Gammarus Lacustris (Amphipoda, Gammaridae) in Lake Sevan,
W82-02781 2H

The Relation Between 'Hydraulic Stress' and Microdistribution of Benthic Macroinvertebrates in a Lowland Running Water System, the Schierenseebroks (North Germany),
W82-02790 5C

Periphyton in the Volta Lake. I. Seasonal Changes on the Trunks of Flooded Trees,
W82-02882 2H

Periphyton in the Volta Lake. II. Seasonal Changes on Wooden Blocks with Depth,
W82-02883 2H

Pollution Effects on the Phytoplankton-Zooplankton Relationships in an Inshore Environment,
W82-02886 5C

Growth Characteristics of the Heterotrophic Bacterial Population of Water and Bottom Sediments in Tanks Under Different Trophic Conditions,
W82-02953 5C

Predator-Prey Relationships Among Water-Mites (Hydracarina) and Other Freshwater Organisms,
W82-02963 5C

POROUS MEDIA
Integral Equation Formulation for Ground-Water Flow,
W82-02716 2F

Influence of Heat Dispersion on Steady Convection in Anisotropic Porous Media,
W82-02924 2F

POTABLE WATER
Cost Estimates for Water Treatment Plant Operation and Maintenance.
W82-02697 6C

POTENTIOMETRIC LEVEL
Potentiometric Surface Maps of the Sparta Sand: Northern Louisiana and Southern Arkansas, 1900, 1965, 1975, and 1980,
W82-02839 2F

POTOMAC RIVER
Stochastic Hydrologic Model for Drought Management,
W82-02897 2E

POWERPLANTS
Combined Flue Gas Desulfurization and Water Treatment in Coal-Fired Power Plants,
W82-02606 3E

PP and L Uses Discharge Water for Fish Farming.
W82-02645 3C

Response of Subtropical Phytoplankton to Power Plant Entrainment,
W82-02708 5C

PREDATION
The Influence of Flatworm Predation on Zooplankton Inhabiting Small Ponds,
W82-02655 2H

Predator-Prey Relationships Among Water-Mites (Hydracarina) and Other Freshwater Organisms,
W82-02963 5C

PREDICTION
Mathematical Models of Water Yield with Particular Reference to Mississippi Watersheds: Interim Report No. 1, A Study of Some Empirical Methods of Determining the Unit Hydrograph,
W82-02803 2A

PREIMPOUNDMENT
Supplement to Predictive Modeling of Effects of the Planned Kindred Lake on Ground-Water Levels and Discharge, Southeastern North Dakota,
W82-02828 4A

PROBABILISTIC PROCESS
Application of Reliability Theory to Hydraulic Engineering Design,
W82-02699 8B

PROBABILITY DISTRIBUTION
Construction of a Gamma-Distribution Probability Paper for Straightening Discharge Probability Curves,
W82-02925 7B

PRODUCTIVITY
Studies on the Primary Production of the River Shatt Al-Arab at Basrah, Iraq,
W82-02776 5C

The Use of Dialyzing Sacks in Estimation of Production of Bacterioplankton and Phytoplankton,
W82-02866 7B

PROJECT PLANNING
Project Outcomes Correlate with Public Participation Variables,
W82-02663 6B

PROTEIN RECOVERY
Protein Recovery from Beef Packing Effluent,
W82-02994 5D

PROTEINS
Protein Recovery from Beef Packing Effluent,
W82-02994 5D

PROTOZOA
Seasonal Change in Ciliate Populations in the Bottom Sediment of a Polluted River,
W82-02797 5C

PUBLIC HEALTH
Recreational Water Quality and Health,
W82-02997 5C

PUBLIC PARTICIPATION
Project Outcomes Correlate with Public Participation Variables,
W82-02663 6B

Cascaded Tradeoffs: A Multiple-Objective, Multiple-Publics Method for Alternatives Evaluation in Water Resources Planning,
W82-02980 6B

PUBLIC POLICY
Digest of Water Resources Policies and Authorities.
W82-02973 6E

PULP AND PAPER INDUSTRY
The Reed Affair: A Canadian Logging and Pollution Controversy,
W82-02605 6B

Field Report on a Nonpolluting Bleach Plant,
W82-02793 5D

New Developments in Papermaking in Western Europe,
W82-02947 5D

Evaluation of Ion Exchange Technology for Toxic and Non-Conventional Pollutant Reduction in Bleach Plant Effluents,
W82-02967 5D

Fate of Toxic and Nonconventional Pollutants in Wastewater Treatment Systems Within the Pulp, Paper, and Paperboard Industry,
W82-02998 5D

PUMPED STORAGE
Hydroacoustic Surveys of Fish Abundance and Distribution in Twin Lakes, Colorado,
W82-02977 6G

Results of Fisheries Investigations at Twin Lakes, Colorado; 1973-76,
W82-02984 6G

PUMPING PLANTS
Control of a Pumping Station by Mini Computer - A Progress Report,
W82-02956 6B

PUMPING STATIONS
Demand Forecasting in Water Supply Networks,
W82-02926 6D

PUMPING TESTS
Analysis of Pumping Test Data Using Marquardt Algorithm,
W82-02721 2F

Determination of Aquifer Parameters from Large-Diameter Dug Well Pumping Tests,
W82-02917 2F

PUMPS
The Cone Pump,
W82-02713 8C

QUEBEC
Spatial and Temporal Overlap in Lake Phytoplankton Communities,
W82-02610 2H

Multivariate Analysis and Geochemical Interpretation of Spatial Variability of the Water Quality of Southern Quebec Rivers. (Analyse Multivariee et Interpretation Geochimique de la Variabilite Spatiale de la Qualite de l'Eau Les Rivieres Du Quebec Meridional),
W82-02662 2K

RADIAL GATES
Prospects of Using Radial Gates on Overflow Dams of Large Hydroelectric Stations,
W82-02693 8A

RADIOACTIVE DATING
Radiocarbon Dating of Groundwater of the Aquifer Confined in the Lower Triassic Sandstones of the Lorraine Region, France,
W82-02877 2F

RADIOACTIVE WASTES
Submerged Demineralization System to Be Used to Process TMI Wastewater.
W82-02621 5D

The Status of Nuclear Waste Management,
W82-02659 5E

RADIUM
Uranium Isotopes and 226Ra Content in the Deep Groundwaters of the Tri-State Region, U.S.A.,
W82-02939 5A

RAIN
An Analysis of the First Year of MAP3S Rain Chemistry Measurements,
W82-02934 2K

RAINFALL
Meteorological Interpretation of the Chemical Composition of Rain-Water at One Measuring Site,
W82-02874 2K

RAINFALL-RUNOFF RELATIONSHIPS
Approximate Error Bounds for Simulated Hydrographs,
W82-02678 2A

RANGE MANAGEMENT
Resource Allocation in a Sierra-Nevada Foothill Beef Cow-Calf Operation Through Linear Programming,
W82-02809 3F

RANGES
Resource Allocation in a Sierra-Nevada Foothill Beef Cow-Calf Operation Through Linear Programming,
W82-02809 3F

RANKING
Mathematical Models of Water Yield with Particular Reference to Mississippi Watersheds: Interim Report No. 1, A Study of Some Empirical Methods of Determining the Unit Hydrograph,
W82-02803 2A

RECLAIMED WATER
Water Reclamation by the Use of Soil-Turfgrass Systems in the Southwest USA,
W82-02817 3C

RECREATION
Summary; Lower Colorado River Recreation Research, 1974-1980,
W82-02976 6B

Recreational Water Quality and Health,
W82-02997 5C

RECREATION DEMAND
Summary; Lower Colorado River Recreation Research, 1974-1980,
W82-02976 6B

RECREATION FACILITIES
Effects of Recreation on Water Quality in Guadalupe Mountains National Park,
W82-02821 5B

RECYCLING
Urban Aquaculture of the Rainbow Trout (Salmo gairdneri),
W82-02812 8I

REMOTE SENSING
Remote Detection of Nutrient and Water Deficiencies in Sugarcane Under Variable Cloudiness,
W82-02709 7B

Water Management in the North Deschutes Unit Irrigation District: Geographic Perspectives and Remote Sensing Applications,
W82-02739 7B

Evaluation of Remote Sensing Data for Input into Hydrological Simulation Program-Fortran (HSPF),
W82-02986 7B

RESEARCH PRIORITIES
Britain's Sewers - Researching for the Future,
W82-02871 5D

RESERVOIR RELEASES
Construction of a Basic-Gate Unit for the Deep Catastrophic Sluice at the Nurek Hydroelectric Plant,
W82-02771 8A

RESERVOIR SITES
Supplement to Predictive Modeling of Effects of the Planned Kindred Lake on Ground-Water Levels and Discharge, Southeastern North Dakota,
W82-02828 4A

RESERVOIRS
The Influence of Stream Salinity on Reservoir Water Quality,
W82-02762 4C

Planning Level Estimates of the Value of Reservoirs for Water Supply and Flow Augmentation in New Hampshire,
W82-02825 6B

The Schooling Mechanism of Young Perch (Perca Fluviatilis) in the Open Part of Lake-Type Reservoirs (As Exemplified by Rybinsk Reservoir),
W82-02954 2H

Water Quality of the Proposed Norden Reservoir, Nebraska, and Its Implications for Fishery Management,
W82-02983 6G

RESISTIVITY
Geoelectric Soundings for Predicting Aquifer Properties,
W82-02619 2F

RETAINING WALLS
Effect of Wave Slope on a Rock Mass in a Revetment,
W82-02694 8B

REVERSE OSMOSIS
Reverse Osmosis Separation of Sulfate, Nitrate, and Ammonia from Mining Effluents,
W82-02640 5D

Scanning Electron Microscopy Study on Reverse Osmosis Membranes Prepared from Indian Cellulosic Polymers,
W82-02929 3A

Inorganic Contaminant Removal from Drinking Water by Reverse Osmosis,
W82-02969 5F

RHODE ISLAND
Geoelectric Soundings for Predicting Aquifer Properties,
W82-02619 2F

RHODE RIVER ESTUARY
Diel Oxygen Variations in the Rhode River Estuary, Maryland, 1970-1978,
W82-02841 5B

RILLS
Modeling Rill Density,
W82-02604 2J

RIVER BASIN DEVELOPMENT
Multiobjective Analysis of Irrigation Planning in River Basin Development,
W82-02855 6A

Water Resources Appraisals for Hydroelectric Licensing: Alaska River Basins, Alaska.
W82-02975 6D

RIVER BASINS
Drainage Areas of Streams at Selected Locations in Kentucky,
W82-02835 7C

RIVER FLOW
Flow Resistance in Coarse Gravel Bed Rivers,
W82-02879 2J

RIVER MURRAY
South Australia's Approach to Salinity Management in the River Murray,
W82-02761 5G

RIVER SYSTEMS
Unsteady Water Quality Model for River Network,
W82-02873 5G

RIVERS
Multivariate Analysis and Geochemical Interpretation of Spatial Variability of the Water Quality of Southern Quebec Rivers. (Analyse Multivariee et Interpretation Geochimique de la Variabilite Spatiale de la Qualite de l'Eau Des Rivieres Du Quebec Meridional),
W82-02662 2K

Hydrochemical Characteristics of the Stream Drwinka and Estimate of Its Self-Purification Ability,
W82-02750 5B

Local Flow Accelerations in Rivers,
W82-02758 2E

Studies on the Primary Production of the River Shatt Al-Arab at Basrah, Iraq,
W82-02776 5C

Distribution of Chromobacteria in a Lowland River,
W82-02795 5C

Diel Oxygen Variations in the Rhode River Estuary, Maryland, 1970-1978,
W82-02841 5B

Space-Time Variability of the Runoff of European Rivers,
W82-02848 2E

The Cost of Quality,
W82-02881 5F

Water Resources Appraisals for Hydroelectric Licensing: Alaska River Basins, Alaska.
W82-02975 6D

ROCK PROPERTIES
Geotechnical Investigations at the Kalyani Dam Site, Chittoor District, Andhra-Pradesh India,
W82-02890 8E

ROME
The Roman Way,
W82-02744 5F

ROUGHNESS COEFFICIENT
Hydraulic Resistance of Floodplains,
W82-02850 2E

Coefficient of Friction in Conduits with Large Roughness.
W82-02901 8B

RUNNING WATERS
The Relation Between 'Hydraulic Stress' and Microdistribution of Benthic Macroinvertebrates in a Lowland Running Water System, the Schierenseebrooks (North Germany),
W82-02790 5C

RUNOFF
Space Time Variability of the Runoff of European Rivers,
W82-02848 2E

RUNOFF VOLUME
Seasonal Salinity Variations in Cleveland Bay, Northern Queensland,
W82-02878 2L

RUSSIA
Construction of a Break-Gate Unit for the Deep Catastrophic Sluice at the Nurek Hydroelectric Plant,
W82-02771 8A

Outflow of Volcanic Rock and Gas During Opening of the Arpa-Sevan Tunnel,
W82-02772 2A

On-Site Investigations of the Contact Zone of the Upstream Face of the Concrete Dam on the Ust-Ilim Hydroelectric Station,
W82-02773 8A

SALINE LAKES
Standing Crop Densities and Distribution of Spirulina and Benthic Diatoms in East African Alkaline Saline Lakes,
W82-02759 2H

The Gammaridae and Corixidae of an Inland Saline Lake from 1975 to 1978,
W82-02779 2H

SALINE WATER INTRUSION
South Australia's Approach to Salinity Management in the River Murray,
W82-02761 5G

The Influence of Stream Salinity on Reservoir Water Quality,
W82-02762 4C

Radiotracer Evaluation of Groundwater Dispersion in a Multi-Layered Aquifer,
W82-02870 2F

SALINITY
Management of Soil Water Budgets of Recharge Areas for Control of Salinity in South-Western Australia,
W82-02754 3F

South Australia's Approach to Salinity Management in the River Murray,
W82-02761 5G

The Influence of Stream Salinity on Reservoir Water Quality,
W82-02762 4C

The Evolution of a Regional Approach to Salinity Management in Western Australia,
W82-02763 4D

Analyses of Solute Distributions in Deeply Weathered Soils,
W82-02764 2K

Groundwater Systems Associated with Secondary Salinity in Western Australia.
W82-02770 2F

Some Ecological Aspects of Lake Qarun, Fayoum, Egypt. Part I. Physico-Chemical Environment,
W82-02859 2H

Seasonal Salinity Variations in Cleveland Bay, Northern Queensland,
W82-02878 2L

Fine Structure of Salinity in the Water Off the Danube Estuary,
W82-02892 2L

SALMON
Effects of Fine Sediments on Growth of Juvenile Coho Salmon in Laboratory Streams,
W82-02639 5C

SALT MARSHES
Carbon Dioxide Assimilation, Photosynthetic Efficiency, and Respiration of a Chesapeake Bay Salt Marsh,
W82-02937 2L

SAMPLE PREPARATION
Preparation of Friable Aquiferous Specimens,
W82-02955 2F

SAMPLING
Statistical Considerations and Sampling Techniques for Ground-Water Quality Monitoring,
W82-02618 7A

A Rate of Rise Controller for Automatic Water Samplers,
W82-02938 7B

SAN FRANCISCO BAY
Plankton Studies in San Francisco Bay. I. Chlorophyll Distributions and Hydrographic Properties of the San Francisco Bay Estuary, July 1977 - December 1979,
W82-02831 2L

Plankton Studies in San Francisco Bay. II. Phytoplankton Abundance and Species Composition, July 1977 - December 1979,
W82-02832 2L

SANITATION
Water Supply and Sanitation Decade Programme,
W82-02757 5F

SATELLITE TECHNOLOGY
Evaluation of Remote Sensing Data for Input into Hydrological Simulation Program-Fortran (HSPF),
W82-02986 7B

SCREENS
Use of Fish Larva Morphometry to Predict Exclusion Capabilities of Small-Mesh Screens at Cooling-Water Intakes,
W82-02687 8I

SEA ICE
Quantitative Composition, Distribution, Community Structure and Standing Stock of Sea Ice Microalgae in the Canadian Arctic,
W82-02649 2C

SEA LEVEL
Tides and Tidal Datums in the United States,
W82-02982 2A

SEALANTS
Improvement of the Seals of Expansion Joints of Hydraulic Structures,
W82-02669 8A

SEASONAL VARIATION
Studies on the Seasonal Changes of Dissolved Organic Carbon, Nitrogen, Phosphorus and Urea Concentrations in Lake Biwa,
W82-02768 2H

Seasonal Change in Ciliate Populations in the Bottom Sediment of a Polluted River,
W82-02797 5C

Seasonal Salinity Variations in Cleveland Bay, Northern Queensland,
W82-02878 2L

Periphyton in the Volta Lake. I. Seasonal Changes on the Trunks of Flooded Trees,
W82-02882 2H

Periphyton in the Volta Lake. II. Seasonal Changes on Wooden Blocks with Depth,
W82-02883 2H

Factors Influencing the Composition, Structure and Density of a Population of Benthic Invertebrates,
W82-02909 2H

SEASONAL VARIATIONS
Occurrence, Distribution and Seasonal Periodicity of Some Aquatic Fungi of Sat-Tal (Nainital), India,
W82-02894 2H

SEAWATER
Particulate and Dissolved Lipids in Sea Water,
W82-02727 5A

Sea Water Distillation in Jersey and Its Use to Augment Conventional Water Resources,
W82-02748 3A

SECONDARY WASTEWATER TREATMENT
Secondary Treatment Waivers Issued, Controversy Continues,
W82-02652 6E

Water Reclamation by the Use of Soil-Turfgrass Systems in the Southwest USA,
W82-02817 3C

SEDIMENT CONCENTRATION
Effects of Fine Sediments on Growth of Juvenile Coho Salmon in Laboratory Streams,
W82-02639 5C

SEDIMENT CONTROL
Mapping Sediment Sources in a New Zealand Mountain Watershed,
W82-02885 2J

SEDIMENT TRANSPORT
River and Suspended Sediment Discharge into Byam Channel, Queen Elizabeth Islands, Northwest Territories, Canada,
W82-02637 2E

Flow Resistance in Coarse Gravel Bed Rivers,
W82-02879 2J

The Variation in Suspended Sediment and Water Properties in the Flood-Water Front Traversing the Tidal Flat,
W82-02928 2L

Bed Load Discharge Coefficient,
W82-02936 2J

SEDIMENT-WATER INTERFACES
Dissolved Iodine Flux from Estuarine Sediments and Implications for the Enrichment of Iodine at the Sediment Water Interface, W82-02656 2K

SEDIMENTATION
Forms of Heavy Metals in the Settling Matter from a Man Made Lake (In Japanese), W82-02719 5B

SEDIMENTOLOGY
Paleolimnology of Lake Kizaki, W82-02863 2J

Post-Glacial Sediments in Lake Linnevatn, Spitsbergen, W82-02869 2H

Mapping Sediment Sources in a New Zealand Mountain Watershed, W82-02885 2J

SEDIMENTS
Chemistry of a 7.5-M Sediment Core from Lake Valencia, Venezuela, W82-02745 2H

Seasonal Change in Ciliate Populations in the Bottom Sediment of a Polluted River, W82-02797 5C

Model of Trace-Metal Partitioning in Marine Sediments, W82-02824 5B

Recent Inshore Sediments in Musandam, Oman, W82-02857 2J

Growth Characteristics of the Heterotrophic Bacterial Population of Water and Bottom Sediments in Tanks Under Different Trophic Conditions, W82-02953 5C

Preparation of Friable Aquiferous Specimens, W82-02955 2F

Settling Velocity of Spherical Particles in Calm Water, W82-02958 1B

SEEPAGE
Rational Dimensions of an Earth Blanket and Its Seepage Calculation, W82-02666 8A

Seepage from Free Water Above Impermeable Tailings, W82-02714 5B

SEEPAGE CONTROL
Bituminous Concrete Antiseepage Curtain for Concrete Dams, W82-02690 8A

Computing the Settlement of Thin Antiseepage Walls Formed from Clayey Soils, W82-02692 8D

SEINE RIVER
Development of the River Seine Estuary: Case Study, W82-02867 2L

SEPARATION TECHNIQUES
Separation of Toxic Organotin Compounds from Aqueous Solution by Adsorption, W82-02641 5D

SEPTIC TANKS
Distribution of Wastewater in Drain Field Pipes, W82-02945 8B

SETTLING VELOCITY
Settling Velocity of Spherical Particles in Calm Water, W82-02958 1B

SEWER INFILTRATION
Infiltration/Inflow Source Identification by Comprehensive Flow Monitoring, W82-02674 5D

SEWER SYSTEMS
Infiltration/Inflow Source Identification by Comprehensive Flow Monitoring, W82-02674 5D

The Roman Way, W82-02744 5F

Britain's Sewers - Researching for the Future, W82-02871 5D

Engineering Responds to Ecology, W82-02935 5D

SEWERS
The Cost of Quality, W82-02881 5F

Group Treatment Evaluation for Metal Finishers, W82-02995 5D

SHALLOW WATER
The Influence of Flatworm Predation on Zooplankton Inhabiting Small Ponds, W82-02655 2H

SHEAR STRESS
Boundary Shear in Smooth and Rough Channels, W82-02711 8B

Some Field Measurements Concerned with the Behavior of Resistance Coefficients in a Tidal Channel, W82-02792 2L

SHEYENNE RIVER
Supplement to Predictive Modeling of Effects of the Planned Kindred Lake on Ground-Water Levels and Discharge, Southeastern North Dakota, W82-02828 4A

SHINER
Aggregation of Spottail Shiners in the Heated Discharge of a Nuclear Power Station, W82-02686 5C

SHORE PROTECTION
Effect of Wave Slope on a Rock Mass in a Revetment, W82-02694 8B

SIBERIA
Applicability and Design Criteria of a Blasting Method for Constructing Deep-Cut Sections of a Canal for Transferring Part of the Flow of Siberian Rivers, W82-02783 8H

SLOPE STABILITY
Slope Failures and Tailing Dam Damage in the 1978 Izu-Ohshima-Kinkai Earthquake, W82-02891 8D

SLOPE STABILIZATION
Impulse Technology for Surface Compaction of Concrete Mixes in Construction of Slope Revetments, W82-02695 8B

SLUDGE
Wastewater Treatment with Powdered Activated Carbon, W82-02642 5D

Polychlorinated Biphenyls in Sewage Sludge and Sediments of the New York Bight, W82-02904 5A

Pilot-Scale Anaerobic Filter Treatment of Heat Treatment Liquor, W82-02972 5D

Fate of Toxic and Nonconventional Pollutants in Wastewater Treatment Systems Within the Pulp, Paper, and Paperboard Industry, W82-02998 5D

SLUDGE DIGESTION
Evaluation of the Full-Scale Application of Anaerobic Sludge Digestion at the Blue Plains Wastewater Treatment Facility - Washington, D.C., W82-02965 5D

SLUDGE DISPOSAL
Current Policies on Land Application, W82-02629 5E

Flue Gas Desulfurization Sludge Disposal Practices for Coal-Fired Steam and Power Plants, W82-02907 5E

Field Investigation of Contaminant Loss from Chemically Stabilized Industrial Sludges, W82-02990 5B

SLUDGE DRYING
Evaluation of High- and Low- Speed Centrifuges, W82-02931 5E

SLUDGE THICKENING
Advanced Sludge Treatment for Modern Waterworks, W82-02889 5D

SLUDGE TREATMENT
Flue Gas Desulfurization Sludge Disposal Practices for Coal-Fired Steam and Power Plants, W82-02907 5E

SLUICE GATES
Construction of a Basic-Gate Unit for the Deep Catastrophic Sluice at the Nurek Hydroelectric Plant, W82-02771 8A

SLUICES
Boundary Calculations of Sluice and Spillway Flows, W82-02677 8B

SMALL WATERSHEDS
Mathematical Models of Water Yield with Particular Reference to Mississippi Watersheds: Interim Report No. 1, A Study of Some Empirical Methods of Determining the Unit Hydrograph, W82-02803 2A

SNAILS
Studies on the Acute Toxicity of Some Heavy Metals to an Indian Freshwater Pond Snail Viviparus Bengalensis L., W82-02789 5C

SNOW WATER EQUIVALENT
Microwave Measurements of Snowpack Properties, W82-02646 2C

SNOWMELT
Land Surface and Lake Storage During Snowmelt Runoff in a Subarctic Drainage System, W82-02624 2C

SOCIAL ASPECTS
The Reed Affair: A Canadian Logging and Pollution Controversy, W82-02605 6B

SOIL EROSION
Soil Erosion and Total Denudation Due to Flash Floods in the Egyptian Eastern Desert, W82-02875 2J

SOIL MOISTURE DEFICIENCY
Response Functions of Crops Yield to Soil Moisture Stress, W82-02725 3F

SOIL STABILITY
Erosion Resistance of Cohesive Soils,
W82-02676 2J

SOIL TYPES
Selection of Irrigation Systems for Land Application of Municipal Wastewater,
W82-02643 3C

SOIL WATER
Coupled Heat and Water Flows Around Buried Cables,
W82-02680 2G

Management of Soil Water Budgets of Recharge Areas for Control of Salinity in South-Western Australia,
W82-02754 3F

SOLIDS
Wastewater Treatment with Powdered Activated Carbon,
W82-02642 5D

SOLUBILITY
Estimation of Calcium Sulfate Solution Rate and Effective Aquifer Surface Area in a Ground-Water System near Carlsbad, New Mexico,
W82-02612 2F

SOLUTE TRANSPORT
Analyses of Solute Distributions in Deeply Weathered Soils,
W82-02764 2K

Leaching of a Sorbed Solute: A Model for Peak Concentration Displacement,
W82-02922 5B

Kd's--Can They Be Used to Describe Reversible Ion Sorption Reactions in Contaminant Migration,
W82-02942 5B

SORPTION
Kd's--Can They Be Used to Describe Reversible Ion Sorption Reactions in Contaminant Migration.
W82-02942 5B

SOUTH AFRICA
Umfolozi Road Bridge Hydraulic Model Investigation,
W82-02868 8A

Radiotracer Evaluation of Groundwater Dispersion in a Multi-Layered Aquifer,
W82-02870 2F

SOUTH DAKOTA
Water-Level Records for the Big Sioux Aquifer, Minnehaha County, South Dakota,
W82-02844 2F

SOUTHEASTERN UNITED STATES
On the Role of Underwater Parks and Sanctuaries in the Management of Coastal Resources in the Southeastern United States,
W82-02905 5G

SOUTHERN CALIFORNIA
New Concepts in Filtration Plant Design and Rehabilitation,
W82-02681 5F

SPATIAL DISTRIBUTION
Hydroacoustic Surveys of Fish Abundance and Distribution in Twin Lakes, Colorado,
W82-02977 6G

SPECIES COMPOSITION
Factors Influencing the Composition, Structure and Density of a Population of Benthic Invertebrates,
W82-02909 2H

SPILLWAYS
Boundary Calculations of Sluice and Spillway Flows,
W82-02677 8B

Measurements of Self-Aerated Flow on a Spillway,
W82-02715 8B

Instrumentation for Aerated Flow on Spillways,
W82-02880 7B

SPRAY IRRIGATION
Wastewater Treatment by a Prototype Slow Rate Land Treatment System,
W82-02981 5D

SPRUCE TREES
Winter Water Relations of Red Spruce on Mount Monadnock, New Hampshire,
W82-02634 2I

STABILIZATION PONDS
Recommendations for Regulatory Modifications: The Use of Waste Stabilization Pond Systems,
W82-02675 5D

STATE JURISDICTION
A Preliminary Survey of State Ground-Water Laws,
W82-02616 6E

STATISTICAL ANALYSIS
Multivariate Analysis and Geochemical Interpretation of Spatial Variability of the Water Quality of Southern Quebec Rivers. (Analyse Multivariee et Interpretation Geochimique de la Variabilite Spatiale de la Qualite de l'Eau Des Rivieres Du Quebec Meridional),
W82-02662 2K

On the Van Belle-Fisher Statistic for Water Pollution Monitoring Via Ecological Change,
W82-02671 5A

Application of Reliability Theory to Hydraulic Engineering Design,
W82-02699 8B

STATISTICAL MEASURES
Mathematical Models of Water Yield with Particular Reference to Mississippi Watersheds: Interim Report No. 1, A Study of Some Empirical Methods of Determining the Unit Hydrograph,
W82-02803 2A

STATISTICAL METHODS
Statistical Considerations and Sampling Techniques for Ground-Water Quality Monitoring,
W82-02618 7A

An Analysis of Areal Infiltration Considering Spatial Variability,
W82-02927 2G

STATISTICAL MODELS
Comparison of Statistical Phosphorus-Retention Models,
W82-02930 5G

STEMFLOW
Vertical Variation in Stemflow Generation,
W82-02959 2I

STOCHASTIC PROCESS
Stochastic Modeling of an Industrial Activated Sludge Process,
W82-02683 5D

Stochastic Hydrologic Model for Drought Management,
W82-02897 2E

STOMATAL TRANSPIRATION
Stomatal Response to Environmental Variables in Two Tropical Forest Species During the Dry Season in Nigeria,
W82-02884 2D

STORAGE
Reliability of Water Resources,
W82-02749 6A

STORM RUNOFF
Urban Catchment Models: A Brief Examination,
W82-02813 4C

Computer Modeling of Flood Alleviation Benefits,
W82-02957 6B

STORM SEWERS
Galvanized Pipe Vies for Equal Alternative Status in Storm Sewer Projects.
W82-02601 8G

STRATIFICATION
Three Coastal Lakes on Kamikoshiki Island, Kagoshima Prefecture,
W82-02798 2H

STRATIGRAPHY
Reconnaissance of the Hot Springs Mountains and Adjacent Areas, Churchill County, Nevada,
W82-02830 1A

STREAM DISCHARGE
Ice Cover Effects on Stream Flows and Mixing,
W82-02698 2C

STREAM FLOW
Method and Apparatus for Supplying Dissolved Chemicals into Water,
W82-02625 5F

STREAMFLOW
Role of Organic Debris Dams in Regulating the Export of Dissolved and Particulate Matter from a Forested Watershed,
W82-02653 4D

Channel Form and Flow Characteristics of Supraglacial Streams, Austre Okstindbreen, Norway,
W82-02787 2E

Low-Flow Characteristics of Kentucky Streams, 1980,
W82-02826 2E

Low-Flow Frequency Data for Selected Stream-Gaging Stations in Florida,
W82-02834 2E

Flow Duration at Selected Stream-Sites in Kentucky,
W82-02837 2E

Calculation of the Annual Distribution of River Runoff When Observation Data Are Available,
W82-02854 2E

STREAMFLOW FORECASTING
Stochastic Hydrologic Model for Drought Management,
W82-02897 2E

Construction of a Gamma-Distribution Probability Paper for Straightening Discharge Probability Curves,
W82-02925 7B

STREAMS
Fluorescence Spectra of Water-Soluble Humic Materials and Some Potential Precursors,
W82-02648 2K

STRESS RELAXATION COEFFICIENT
Stress Relaxation in Concrete of Massive Hydraulic Structures,
W82-02786 8A

SUBARCTIC ZONE
Land Surface and Lake Storage During Snowmelt Runoff in a Subarctic Drainage System,
W82-02624 2C

SUBSTRATES
Mineral Nutrient Availability in Watercress Bed Substrates,
W82-02769 2I

SUGARCANE
Remote Detection of Nutrient and Water Deficiencies in Sugarcane Under Variable Cloudiness,
W82-02709 7B

SULFIDES
Determination of the Solubility of Ferrous Sulfide in a Seasonally Anoxic Marine Basin,
W82-02665 2K

Characterization of Boliden's Sulfide-Lime Precipitation System,
W82-02988 5D

SULFUR COMPOUNDS
The Prediction of Rain Acidity and SO2 Scavenging in Eastern North America,
W82-02628 5B

SULFURIC ACID
The Relative Contributions of Sulfuric and Nitric Acids in Acid Rain to the Acidification of the Ecosystem. Implications for Control Strategies,
W82-02913 5C

SURFACE-GROUNDWATER RELATIONS
Groundwater Systems Associated with Secondary Salinity in Western Australia.
W82-02770 2F

SURFACE RUNOFF
Land Surface and Lake Storage During Snowmelt Runoff in a Subarctic Drainage System,
W82-02624 2C

Miscellaneous Surface-Water Data, Pecos River Basin, New Mexico,
W82-02827 7C

SURFACE WATER
Chemical Coagulation of Surface Water,
W82-02623 5F

Miscellaneous Surface-Water Data, Pecos River Basin, New Mexico,
W82-02827 7C

Geology and Water Availability of Dallas County, Alabama,
W82-02833 6D

Drainage Areas of Streams at Selected Locations in Kentucky,
W82-02835 7C

Hydrologic Evaluation of a Hypothetical Coal-Mining Site Near Chrisney, Spencer County, Indiana,
W82-02840 6B

Water Resources Data for Alaska, Water Year 1980.
W82-02845 7C

Water Resources Data for Wyoming, Water Year 1980--Volume 1. Missouri River Basin.
W82-02846 7C

Water Resources Data for Mississippi, Water Year 1980.
W82-02847 7C

SURFACTANTS
Origin and Chemical Composition of Androscoggin River Foam,
W82-02970 5B

SURVEYS
Mapping Sediment Sources in a New Zealand Mountain Watershed,
W82-02885 2J

SUSPENDED SEDIMENTS
A Sediment Trap Experiment in Funka Bay, Japan: 'Upward Flux' of Particulate Matter in Seawater,
W82-02893 2K

SWEDEN
Lake Vattern,
W82-02755 2H

SWIMMING
Recreational Water Quality and Health,
W82-02997 5C

SYNTHETIC FUELS
A Chironomus Tentans Bioassay for Testing Synthetic Fuel Products and Effluents, with Data on Acridine and Quinoline,
W82-02630 5C

SYSTEMS ANALYSIS
Application of Reliability Theory to Hydraulic Engineering Design,
W82-02699 8B

TAMAGAWA RIVER
Seasonal Change in Ciliate Populations in the Bottom Sediment of a Polluted River,
W82-02797 5C

TAXONOMY
Plankton Studies in San Francisco Bay. II. Phytoplankton Abundance and Species Composition, July 1977 - December 1979,
W82-02832 2L

TECHNOLOGY TRANSFER
A Multimedia Information Package Regarding Land Application of Wastewater and Sludge: A Study of Training Dissemination Specialists, Evaluation Methods, and Cost-Effectiveness,
W82-02815 5D

TEHAMA-COLUSA CANAL
West Sacramento Canal Unit Reformulation.
W82-02974 6B

TEMPERATURE EFFECTS
Chironomidae (Diptera) of Baldwin Lake, Illinois, a Cooling Reservoir,
W82-02620 2H

Coupled Heat and Water Flows Around Buried Cables,
W82-02680 2G

On-Site Investigations of the Contact Zone of the Upstream Face of the Concrete Dam on the Ust-Ilim Hydroelectric Station,
W82-02773 8A

TERRAIN ANALYSIS
Hydraulic Resistance of Floodplains,
W82-02850 2E

TERTIARY WASTEWATER TREATMENT
Estimation of Primary Productivity from Diel Nitrate Uptake Measurements of the Water Hyacinth Eichhornia Crassipes in an Aquaculture System,
W82-02635 5D

TESTING PROCEDURES
Design and Development of an Automated Hydrostatic Flexible Membrane Test Facility,
W82-02978 8G

TEXAS
Effects of Recreation on Water Quality in Guadalupe Mountains National Park,
W82-02821 5B

TEXTILE MILL WASTES
Toxicity of Textile Mill Effluents to Freshwater and Estuarine Algae, Crustaceans and Fishes,
W82-02710 5C

THAILAND
An Economic Analysis of Water Resources Development in Deltaic Regions of Asia: The Case of Central Thailand,
W82-02735 6D

THERMAL CONDUCTIVITY
Influence of Heat Dispersion on Steady Convection in Anisotropic Porous Media,
W82-02924 2F

THERMAL POLLUTION
Aggregation of Spottail Shiners in the Heated Discharge of a Nuclear Power Station,
W82-02686 5C

THERMAL STRESS
Response of Subtropical Phytoplankton to Power Plant Entrainment,
W82-02708 5C

THERMAL WATER
Aquifer Thermal Energy Storage: A Numerical Simulation of Auburn University Field Experiments,
W82-02919 4B

THREE MILE ISLAND
Submerged Demineralization System to Be Used to Process TMI Wastewater.
W82-02621 5D

TIDAL EFFECTS
Atoll Island Hydrology,
W82-02617 2F

TIDAL FLATS
The Variation in Suspended Sediment and Water Properties in the Flood-Water Front Traversing the Tidal Flat,
W82-02928 2L

TIDAL RANGE
Tides and Tidal Datums in the United States,
W82-02982 2A

TIDAL RIVERS
Fish Movement Upstream Through a Central Queensland (Fitzroy River) Coastal Fishway,
W82-02800 8I

A Reexamination of the Zooplankton Community of a Delaware Tidal Stream,
W82-02805 5B

TIDES
Tides and Tidal Datums in the United States,
W82-02982 2A

TILAPIA
Trace Metal Concentrations in Oxidation Ponds,
W82-02703 5D

TOXICITY
A Chironomus Tentans Bioassay for Testing Synthetic Fuel Products and Effluents, with Data on Acridine and Quinoline,
W82-02630 5C

The Status of Nuclear Waste Management,
W82-02659 5E

Toxicity of Textile Mill Effluents to Freshwater and Estuarine Algae, Crustaceans and Fishes,
W82-02710 5C

Studies on the Acute Toxicity of Some Heavy Metals to an Indian Freshwater Pond Snail Viviparus Bengalensis L.,
W82-02789 5C

Reduction of Toxicity to Aquatic Organisms by Industrial Wastewater Treatment,
W82-02971 5C

Alterations in the Frequency of Sister Chromatid Exchanges in Flatfish from Puget Sound,

Washington, Following Experimental and Natural Exposure to Mutagenic Chemicals,
W82-02979 5C

TRACE ELEMENTS
Model of Trace-Metal Partitioning in Marine Sediments,
W82-02824 5B

TRACE METALS
Kinetics of Trace Metal Partitioning in Model Anoxic Marine Sediments,
W82-02820 5B

TRACERS
Radiotracer Evaluation of Groundwater Dispersion in a Multi-Layered Aquifer,
W82-02870 2F

TRAINING
A Multimedia Information Package Regarding Land Application of Wastewater and Sludge: A Study of Training Dissemination Specialists, Evaluation Methods, and Cost-Effectiveness,
W82-02815 5D

TRANSMISSIVITY
Geoelectric Soundings for Predicting Aquifer Properties,
W82-02619 2F

Determination of Aquifer Parameters from Large-Diameter Dug Well Pumping Tests,
W82-02917 2F

TREATMENT PLANTS
Operation Reports: East Bay Municipal District (SD No 1), California.
W82-02707 5D

TRIHALOMETHANES
Bacteria from a Suspended Growth System as Organic Precursors to the Formation of Trihalomethanes,
W82-02806 5F

Removing Trace Organics from Drinking Water Using Activated Carbon and Polymeric Adsorbents,
W82-02987 5F

TROPHIC LEVEL
Nutrient Loading - Trophic State Relationships in Florida Lakes,
W82-02811 5B

Blue-Green Algal Ammonia Uptake in Hypertrophic Prairie Lakes,
W82-02914 2H

Ammonia Volatilization in a Hypertrophic Prairie Lake,
W82-02915 2H

TROUT
Urban Aquaculture of the Rainbow Trout (Salmo gairdneri),
W82-02812 8I

Hydroacoustic Surveys of Fish Abundance and Distribution in Twin Lakes, Colorado,
W82-02977 6G

Results of Fisheries Investigations at Twin Lakes, Colorado; 1973-76,
W82-02984 6G

TRUK
The Development of a Village Water Supply System on Truk,
W82-02816 5F

TUNNEL CONSTRUCTION
Use of Crack-Resistant Linings of Hydraulic Tunnels with Consolidation Grouting of the Rock,
W82-02670 8A

Outflow of Volcanic Rock and Gas During Opening of the Arpa-Sevan Tunnel,
W82-02772 2A

Construction of the Diversion Pressure Tunnel of the Inguri Hydroelectric Station,
W82-02949 8A

Progressive Solutions in the Design of Under-Ground Structures for the Rogun Hydroelectric Plant,
W82-02950 8A

TUNNEL HYDRAULICS
Calculation of Diversion Tunnels of Special Profiles Operating Under Conditions of a Free Uniform Flow,
W82-02785 8A

TUNNEL LININGS
Use of Crack-Resistant Linings of Hydraulic Tunnels with Consolidation Grouting of the Rock,
W82-02670 8A

Study of the Experience in Operating Hydraulic Tunnels,
W82-02782 8A

TURBULENT FLOW
Modeling Rill Density,
W82-02604 2J

On Modeling the Turbulent Transport of Passive Biological Variables in Aquatic Ecosystems,
W82-02661 2L

TURFGRASSES
Water Reclamation by the Use of Soil-Turfgrass Systems in the Southwest USA,
W82-02817 3C

TWIN LAKES
Hydroacoustic Surveys of Fish Abundance and Distribution in Twin Lakes, Colorado,
W82-02977 6G

Results of Fisheries Investigations at Twin Lakes, Colorado; 1973-76,
W82-02984 6G

ULTRAVIOLET RADIATION
Treatment Plant Features Ultraviolet Disinfection,
W82-02644 5D

Ultraviolet Disinfection of a Secondary Wastewater Treatment Plant Effluent,
W82-02985 5D

UMFOLOZI RIVER
Umfolozi Road Bridge Hydraulic Model Investigation,
W82-02868 8A

UNDERGROUND STRUCTURES
Progressive Solutions in the Design of Under-Ground Structures for the Rogun Hydroelectric Plant,
W82-02950 8A

UNDERWATER
On the Role of Underwater Parks and Sanctuaries in the Management of Coastal Resources in the Southeastern United States,
W82-02905 5G

UNIT HYDROGRAPHS
Analysis of Flood Hydrographs from Wetland Areas,
W82-02733 2A

UNITED KINGDOM
Reliability of Water Resources,
W82-02749 6A

Britain's Sewers - Researching for the Future,
W82-02871 5D

Totnes Sewage Treatment, Resewerage and Flood Prevention Scheme.
W82-02872 5D

Demand Forecasting in Water Supply Networks,

W82-02867 2L

SOUTH AUSTRALIA ENGINEERING AND WATER SUPPLY DEPT., ADELAIDE.
South Australia's Approach to Salinity Management in the River Murray,
W82-02761 5G

SOUTHEASTERN MASSACHUSETTS UNIV., NORTH DARTMOUTH.
The Freshwater and Brackish-Water Diatoms of Penikese Island, Massachusetts: 1923-1973,
W82-02696 2H

SOUTHERN CALIFORNIA METROPOLITAN WATER DISTRICT, LOS ANGELES.
New Concepts in Filtration Plant Design and Rehabilitation,
W82-02681 5F

SOUTHERN ILLINOIS UNIV. AT CARBONDALE. COAL EXTRACTION AND UTILIZATION RESEARCH CENTER.
Management of Ground Water Contaminated by Aromatic Hydrocarbons in the Aquifer Supplying Ames, Iowa,
W82-02611 5B

SOUTHERN ILLINOIS UNIV. AT CARBONDALE. DEPT. OF ZOOLOGY.
Chironomidae (Diptera) of Baldwin Lake, Illinois, a Cooling Reservoir,
W82-02620 2H

SOUTHERN UNIVERSITIES NUCLEAR INST., FAURE (SOUTH AFRICA). ATOMIC ENERGY BOARD ISOTOPE UNIT.
Radiotracer Evaluation of Groundwater Dispersion in a Multi-Layered Aquifer,
W82-02870 2F

SOUTHWEST RESEARCH INST., SAN ANTONIO, TX.
Determination of Phthalates in Industrial and Municipal Wastewaters,
W82-02999 5A

SOUTHWESTERN GREAT PLAINS RESEARCH CENTER, BUSHLAND, TX.
Planting Date and Water Deficit Effects on Development and Yield of Irrigated Winter Wheat,
W82-02607 3F

STANFORD UNIV., CA. DEPT. OF CIVIL ENGINEERING.
Chlorine Dioxide for Wastewater Disinfection: A Feasibility Evaluation,
W82-02989 5D

STATE UNIV. OF NEW YORK AT STONY BROOK. MARINE SCIENCES RESEARCH CENTER.
Nontidal Circulation and Mixing Processes in the Lower Potomac Estuary,
W82-02657 2L

SULAIMANIYAH UNIV. (IRAQ). DEPT. OF BIOLOGY.
On the Algal Ecology of the Lowland Iraqi Marshes,
W82-02777 6G

SURREY UNIV., GUILDFORD (ENGLAND). DEPT. OF MICROBIOLOGY.
Distribution of Chromobacteria in a Lowland River,
W82-02795 5C

TATA CONSULTING ENGINEERS (INDIA).
Water for Industry,
W82-02767 6D

TECHNICAL UNIV. OF DENMARK, COPENHAGEN. INST. FUER PAPIERFABRIKATION.
New Developments in Papermaking in Western Europe,
W82-02947 5D

TENNESSEE UNIV., KNOXVILLE. DEPT. OF AGRICULTURAL ECONOMICS.
Securing Support for Nonpoint Pollution Control with Local Compensation,
W82-02807 5G

TEXAS A AND M UNIVERSITY, COLLEGE STATION.
Effects of Hydrological and Biological Variables on the Survival, Growth, and Food Utilization of Estuarine Fishes Cage-Cultured in a Heated Water System,
W82-02730 5C

TEXAS A AND M UNIVERSITY, COLLEGE STATION. DEPARTMENT OF OCEANOGRAPHY.
Particulate and Dissolved Lipids in Sea Water,
W82-02727 5A

TEXAS TECH UNIV., LUBBOCK. DEPT. OF CIVIL ENGINEERING.
Effects of Recreation on Water Quality in Guadalupe Mountains National Park,
W82-02821 5B

TEXAS TECH UNIV., LUBBOCK. DEPT. OF GEOSCIENCE.
A Geochemical Method of Determining Dispersivity in Regional Groundwater Systems,
W82-02941 2F

TEXAS UNIV. AT AUSTIN.
Optimal Water Reuse Planning,
W82-02736 6A

TEXAS UNIV. AT AUSTIN. ENGINEERING DEPARTMENT. DEPT. OF ENGINEERING.
Recommendations for Regulatory Modifications: The Use of Waste Stabilization Pond Systems,
W82-02675 5D

TOKAI UNIV., SHIZUOKA (JAPAN). FACULTY OF MARINE SCIENCE AND TECHNOLOGY.
Slope Failures and Tailing Dam Damage in the 1978 Izu-Ohshima-Kinkai Earthquake,
W82-02891 8D

TOKYO METROPOLITAN UNIV. (JAPAN). DEPT. OF BIOLOGY.
Seasonal Change in Ciliate Populations in the Bottom Sediment of a Polluted River,
W82-02797 5C

The Effect of Alpha-Hydroxybenzylmethanesulfonate on Photosynthesis and Excretion of Chlorella and Natural Phytoplankton in a Lake,
W82-02918 5C

TOKYO SCIENCE UNIV. (JAPAN). FACULTY OF PHARMACEUTICAL SCIENCE.
Prevention of Putrefaction in Organic Sludge by Co-Precipitation of Bactericide and Coagulant,
W82-02717 5D

UDAIPUR UNIV. (INDIA). DEPT. OF LIMNOLOGY AND FISHERIES.
Studies on the Acute Toxicity of Some Heavy Metals to an Indian Freshwater Pond Snail Viviparus Bengalensis L.,
W82-02789 5C

UNITATA BERHAD, TELUK ANSON (MALAYSIA).
By-Product Recovery Finances Treatment,
W82-02756 5D

UNIVERSIDAD DE ORIENTE, CUMANA (VENEZUELA). INST. OF OCEANOGRAPHY.
Studies on the Primary Production of the River Shatt Al-Arab at Basrah, Iraq,
W82-02776 5C

UNIVERSITY COLL., LONDON (ENGLAND).
Recent Inshore Sediments in Musandam, Oman,
W82-02857 2J

UNIVERSITY COLL., LONDON (ENGLAND). DEPT. OF CIVIL ENGINEERING.
Concentration of Virus from Tap Water at Ambient Salt and pH Levels Using Positively Charged Filter Media,
W82-02712 5A

UNIVERSITY COLL. OF WALES, ABERYSTWYTH. DEPT. OF ZOOLOGY.
Allochthonous Plant Litter as a Source of Organic Material in an Oligotrophic Lake (Llyn Frongoch),
W82-02778 2H

UNIVERSITY OF WALES INST. OF SCIENCE AND TECHNOLOGY, CARDIFF. DEPT. OF APPLIED BIOLOGY.
The Application of a Water-Quality Model to the River Wye, Wales,
W82-02876 5A

UTAH STATE UNIV., LOGAN. WATER RESEARCH LAB.
Modeling Cavitation for Closed Conduit Flow,
W82-02700 8B

UTRECHT RIJKSUNIVERSITEIT (NETHERLANDS). INST. VOOR METEOROLOGIE EN OCEANOGRAFIE.
Meteorological Interpretation of the Chemical Composition of Rain-Water at One Measuring Site,
W82-02874 2K

VANDERBILT UNIV., NASHVILLE, TN. DEPT. OF CHEMICAL ENGINEERING.
Stochastic Modeling of an Industrial Activated Sludge Process,
W82-02683 5D

VIRGINIA COMMONWEALTH UNIV., RICHMOND. DEPT. OF BIOLOGY.
The Response of Macroinvertebrates to Aquatic Macrophyte Decomposition,
W82-02664 2H

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. COLL. OF ARCHITECTURE AND URBAN STUDIES.
Runoff and Pollution Abatement Characteristics of Concrete Grid Pavements,
W82-02801 5B

VIRGINIA STATE HEALTH DEPT., RICHMOND.
Combined Effects of Cadmium and Nickel on Activated Sludge Process,
W82-02704 5D

VOLTA LAKE RESEARCH AND DEVELOPMENT PROJECT, AKOSOMBO (GHANA).
Periphyton in the Volta Lake. I. Seasonal Changes on the Trunks of Flooded Trees,
W82-02882 2H

WASHINGTON UNIV., SEATTLE.
On the Van Belle-Fisher Statistic for Water Pollution Monitoring Via Ecological Change,
W82-02671 5A

WASHINGTON UNIV., SEATTLE. COLL. OF FISHERIES.
Hydroacoustic Surveys of Fish Abundance and Distribution in Twin Lakes, Colorado,
W82-02977 6G

Alterations in the Frequency of Sister Chromatid Exchanges in Flatfish from Puget Sound, Washington, Following Experimental and Natural Exposure to Mutagenic Chemicals,
W82-02979 5C

WASHINGTON UNIV., SEATTLE. DEPT. OF CIVIL ENGINEERING.
Approximate Error Bounds for Simulated Hydrographs,
W82-02678 2A

An Analysis of the First Year of MAP3S Rain Chemistry Measurements,
W82-02934 2K

WATER AND POWER RESOURCES SERVICES, DENVER, CO. ENGINEERING AND RESEARCH CENTER.
Design and Development of an Automated Hydrostatic Flexible Membrane Test Facility,
W82-02978 8G

WATER POLLUTION CONTROL AUTHORITY, VERNON, CT.
Wastewater Treatment with Powdered Activated Carbon,
W82-02642 5D

WATER POLLUTION CONTROL BOARD, BARODA (INDIA). GUJARAT REGIONAL LAB.
Scanning Electron Microscopy Study on Reverse Osmosis Membranes Prepared from Indian Cellulosic Polymers,
W82-02929 3A

WATER POLLUTION CONTROL PLANTS, PHILADELPHIA, PA.
Evaluation of High- and Low- Speed Centrifuges,
W82-02931 5E

WATER RESEARCH CENTRE ENGINEERING CENTRE, SWINDON (ENGLAND).
Britain's Sewers - Researching for the Future,
W82-02871 5D

WATERLOO UNIV. (ONTARIO). DEPT. OF EARTH SCIENCES.
Kd's--Can They Be Used to Describe Reversible Ion Sorption Reactions in Contaminant Migration,
W82-02942 5B

WATERLOO UNIV. (ONTARIO). SCHOOL OF URBAN AND REGIONAL PLANNING.
The Reed Affair: A Canadian Logging and Pollution Controversy,
W82-02605 6B

WEIR PUMPS LTD., GLASGOW (SCOTLAND).
The Cone Pump,
W82-02713 8C

WESTERN AUSTRALIA DEPT. OF AGRICULTURE, SOUTH PERTH. DIV. OF RESOURCE MANAGEMENT.
Groundwater Systems Associated with Secondary Salinity in Western Australia,
W82-02770 2F

WESTERN AUSTRALIA UNIV., NEDLANDS. DEPT. OF AGRONOMY.
Management of Soil Water Budgets of Recharge Areas for Control of Salinity in South-Western Australia,
W82-02754 3F

WESTERN AUSTRALIA UNIV., NEDLANDS. DEPT. OF CIVIL ENGINEERING.
The Influence of Stream Salinity on Reservoir Water Quality,
W82-02762 4C

WESTERN AUSTRALIAN INST. OF TECH., SOUTH BENTLEY. DEPT. OF PHYSICS.
Acoustic Reflection from Estuarine Pycnoclines,
W82-02722 2L

WHITMAN AND HOWARD, INC., WELLESLEY, MA.
Engineering Responds to Ecology,
W82-02935 5D

WILLIAM AND MARY COLL., GLOUCESTER POINT, VA. INST. OF MARINE SCIENCE.
Detoxification of Chlorinated Sewage Effluent by Dechlorination in Estuarine Waters,
W82-02688 5C

WILLIAM AND MARY COLL., WILLIAMSBURG, VA. DEPT. OF CHEMISTRY.
Rainwater Acidity Measurement Problems,
W82-02627 5A

WILLIAMS AND WORKS, GRAND RAPIDS, MI.
Selection of Irrigation Systems for Land Application of Municipal Wastewater,
W82-02643 3C

WISCONSIN UNIV., LA CROSSE. RIVER STUDIES CENTER.
Watershed Impact on Stream Water Quality: A Technique for Regional Assessment,
W82-02818 5B

WISCONSIN UNIV.-MADISON.
An Economic Analysis of Water Resources Development in Deltaic Regions of Asia: The Case of Central Thailand,
W82-02735 6D

WISCONSIN UNIV.-MADISON. LAB. OF LIMNOLOGY.
Decomposition and Microbial Colonization of Leaves in a Stream Modified by Coal Ash Effluent,
W82-02654 5C

YAMANASHI UNIV., KOFU (JAPAN). DEPT. OF ENVIRONMENTAL ENGINEERING.
Bactericidal Effect of Seawater Containing Digested Night Soil and Marine Plankton Against Intestinal Bacteria, (In Japanese),
W82-02799 5E

YARMOUK UNIV., IRBID (JORDAN). DEPT. OF CIVIL ENGINEERING.
Technical and Ecological Impacts of the High Aswan Dam,
W82-02856 4A

YORKSHIRE WATER AUTHORITY (ENGLAND).
The Cost of Quality,
W82-02881 5F

SELECTED WATER RESOURCES ABSTRACTS

A monthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 15, NUMBER 7
JULY 1, 1982

W82-03001 -- W82-03400

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a monthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and montlhy updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

WATER TEMPERATURE DYNAMICS IN EXPERIMENTAL FIELD CHANNELS: ANALYSIS AND MODELING,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
H. G. Stefan, J. Gulliver, A. Y. Fu, and M. G. Hahn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-218349, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S3-81-008, July, 1981. 6 p, 2 Fig, 1 Tab.

Descriptors: *Water temperature, *Simulation analysis, *Weather, *Channels, Heat transfer, *Thermodynamics, Wind, Microenvironment, Computer models, *Thermal pollution, Model studies, Ecological effects.

The hydraulic and temperature environment in the shallow field channels of the Monticello Ecological Research Station (MERS) was measured and simulated to provide some background for several biological studies, including one on the effects of artificially high water temperatures. An analysis of the temperature measurement problem, the channel temperature regime, microhabitat conditions, and temporal and spatial water temperature dynamics was essential. A dynamic stream temperature simulation model (MNSTREM) with a 3-hour time resolution was developed and verified to give predictions with a standard error of only 0.2 to 0.3 degrees C. A data-bank of 3-hour water temperature data was developed and analyzed statistically. A wind speed function, essential for the correct prediction of water temperature, was developed from on-site meterological and water temperature data. Longitudinal dispersion in the channels and heat transfer into the bed material below the pools of the experimental channels were measured. A computer simulation program (TSOIL) to predict the unsteady water temperature distribution in the three-layered system was also developed. The results of this study are also applicable to the study of temperature dynamics in thermally polluted shallow streams, to the design of canals for cooling water disposal, and to the study of natural water temperature regimes of small streams. (Moore-SRC)

A PROBLEM POSED BY VAPOUR-DOMINATED GEOTHERMAL SYSTEMS,
California Univ., Los Angeles. Dept. of Earth Sciences.
G. Schubert, J. M. Straus, and M. A. Grant.
Nature (London), Vol 287, No 5781, p 423-425, October, 2, 1980. 2 Fig, 8 Ref.

Descriptors: *Geothermal studies, *Steam, *Permeability, *Thermal water, Geothermal resources, Water vapor, Rocks, Condensates, Groundwater, Perched groundwater, Kamojang geothermal field, *Indonesia.

An analysis is presented of the gravitational stability of water over steam in a porous medium. Pressure measurements in wells drilled to different depths have revealed the basic structure of vapor-dominated systems. The near surface condensate layer of a vapor-dominated geothermal system can be stably maintained above the main steam reservoir by restoring forces associated with the displacement of the phase-change interface. Relatively low permeability is required near the condensate layer-steam zone interface to keep the water from falling down into the underlying region of steam. Any stabilization is possible for a non-zero permeability value. If the interface behaved in a manner similar to the boundary between immiscible fluids, the rocks would have to be impermeable to keep the condensate layer from falling down. Under typical conditions, the stability can be maintained, provided that the permeability of the rocks at the depth of the steam-water boundary does not exceed about 40 sq nm. This stability requirement is what determines the thickness of the condensate layer or the distance between the steam reservoir and the surface. (Small-FRC)

COMPLETE VITRIFICATION IN PURE LIQUID WATER AND DILUTE AQUEOUS SOLUTIONS,
Innsbruck Univ. (Austria). Inst. for Inorganic and Analytic Chemistry.
P. Bruggeller, and E. Mayer.
Nature, Vol 288, No 5791, p 569-571, December 11, 1980. 4 Fig, 16 Ref.

Descriptors: *Ice, *Freezing, *Vitrified water, Physical properties, Emulsions, *Aqueous solutions, *Pure water, Comparison studies.

Pure liquid water was vitrified by jet-freezing 1-5 micrometer aqueous droplets of emulsion made by sonifying 0.03 g Span 65 (surfactant), 9 ml n-heptane, and (1) 1 ml pure liquid water or (2) 1 ml 0.10 M aqueous CuC12 solution. 5 ml emulsion were jetted through a glass tube with 50 micrometer aperture at 100 atmospheres working pressure into 120 ml vigorously stirred liquid ethane at 90 K. The essential 40 K supercooling effect was achieved. The vitrification of both water and CuC12 solution was demonstrated by differential thermal analysis warm-up curves as well as by X-ray diffraction and ESR spectroscopy. The exothermic peak occurred at 150 K, the temperature reported for the devitrification of amorphous ice prepared from water vapor. (Cassar-FRC)
W82-03361

WAKE COLLAPSE IN THE THERMOCLINE AND INTERNAL SOLITARY WAVES,
Catholic Univ. of America, Washington, DC. Dept. of Civil Engineering.
T. W. Kao, and H-P. Pao.
Journal of Fluid Mechanics, Vol 97, No 1, 115-127, March, 1980. 9 Fig, 3 Tab, 9 Ref.

Descriptors: *Thermocline, *Waves, *Wave velocity, Wavelengths, Mixing, Stratification, Wave action, Wave direction.

The collapse of a mixed region at mid-depth of a thermocline-type stratification was investigated experimentally, in which the extent of the mixed region was generally larger than the scale of the thermocline thickness. Following the collapse, two solitary wave-like disturbances were created, one propagating to the right and the other to the left. Detailed measurements were made of the propagation speed and structure of these waves and their collisions with others were noted. Hot-film anemometry and streak pictures were used. Using Benney's method, an analytical solution was obtained for a solitary wave in a thermocline stratification for a medium of finite total depth. The solution was valid for shallow water. There was excellent agreement between experimental and calculated results, which confirmed that the disturbances were solitary waves obeying the Korteweg-de Vries equation. (Small-FRC)

AN ION-ASSOCIATION MODEL FOR ESTIMATING ACIDITY CONSTANTS (AT 25 C AND 1 ATM PRESSURE) IN ELECTROLYTE MIXTURES RELATED TO SEAWATER (IONIC STRENGTH < 1 MOL/KG H20),
Marine Biological Association of the United Kingdom, Plymouth (England).
A. G. Dickson, and M. Whitfield.
Environmental Science and Technology, Vol 15, No 10, p 1155-1164, October, 1981. 5 Fig, 4 Tab, 66 Ref.

Descriptors: *Model studies, *Seawater, *Ions, Equilibrium, Natural waters, Acids, Bases, Chemical reactions, Chemical properties, Salinity, Thermodynamics, Electrolytes.

In addition to interpreting the electrolytic properties of seawater, the Garrels and Thompson ion-association model has been modified to explain the major acid-base systems present in seawater. The data for the activity coefficients of the species examined are presented as a function of ionic strength. The model may be applied to solutions with ionic strengths ranging from 0 to 1 mol/kg H20, allowing the prediction of various equilibrium thermodynamic parameters for natural waters. The model was used under conditions simulating a variety of ionic strengths to estimate the stoichiometric acidity constants of the major weak acids which are found in seawater. Results showed good agreement (all within 10%) between experimental and model estimates. Improvement of the model through a combined interaction and association approach is recommended. (Geiger-FRC)
W82-03194

THE CONCENTRATION AND ISOTOPIC FRACTIONATION OF GASES DISSOLVED IN FRESHWATER IN EQUILIBRIUM WITH THE ATMOSPHERE, 1. OXYGEN,
Amherst Coll., MA. Dept. of Physics.
B. B. Benson, and D. Krause, Jr.
Limnology and Oceanography, Vol 25, No 4, p 662-671, July, 1980. 1 Fig, 3 Tab, 23 Ref.

Descriptors: *Dissolved oxygen, *Isotope fractionation, *Solubility coefficient, Oxygen, Equilibrium, Physical properties.

Concentrations of oxygen dissolved in freshwater in equilibrium with the atmosphere from 0 to 40 C and 0.5 to 1.1 atmosphere may be obtained from the equations and tables presented. The values are based on values for the Henry coefficient of oxygen, which have an accuracy of 0.02%. Equations which relate the Henry coefficient to equilibrium concentrations in natural waters include corrections for molecular interactions in the vapor phase. Estimated accuracy of these derived values is 0.07% at 0 C and 0.04% at 40 C, more accurate than values in UNESCO tables. An equation is given to determine the difference between the 034:032 abundance ratio in the dissolved gas and the air under equilibrium conditions between 0 and 60 C. (Cassar-FRC)

2A. General

EXPERIMENTAL STUDIES OF THE EFFECTS OF EPHEMERAL STREAMFLOW DEPTHS ON INFILTRATION,
Stanford Univ., CA.
J. W. Reeder.
PhD Dissertation, 1981. 197 p, 42 Fig, 108 Ref, 3 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-15823.

Descriptors: *Ephemeral streams, *Model studies, *Mathematical models, *Infiltration, Stream discharge, Soil water, Infiltration rate, Surface-groundwater relations, Green-Ampt Model.

The objectives were to gain insight into the complex interactions between ephemeral stream flow and subsurface hydrology, and to develop an understanding and tools necessary to permit the management of ephemeral stream systems and the aquifers they recharge. The Green-Ampt model in comparison with the Richards numerical model was shown to be a workable tool for representing one-dimensional infiltration under the action of fluctuating water depths. It was found that the value of the effective suction head at the lower end of the Green-Ampt saturated slug decreases with respect to time, decreases with respect to greater initial uniform soil-moisture content, and increases with respect to water depth. A theoretical basis for the Green-Ampt model was derived, where the vertical flux in a wetting soil-moisture profile was assumed not to be a function of vertical position. The errors in total infiltration or infiltration rate caused by using constant effective suction heads in the Green-Ampt model may be reduced to accept-

able levels by using appropriate suction values. The range of these errors are larger for smaller or zero surface-water depths than for larger surface-water depths for a given range of effective suction heads. The Green-Ampt model may be used successfully to represent one-dimensional infiltration under rapidly varying surface-water depths; where the best choice of a constant effective suction head depends upon the particular problem or application of the model. (Sinha-OEIS)
W82-03013

WORTH OF SHORT-TERM RAINFALL FORECASTING FOR COMBINED SEWER OVERFLOW CONTROL,

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. W. Labadie, R. C. Lazaro, and D. M. Morrow.
Water Resources Research, Vol 17, No 5, p 1489-1497, October, 1981. 10 Fig, 4 Tab, 21 Ref.

Descriptors: *Model studies, *Storm-overflow sewers, Sewers, Combined sewer overflows, Storms, Storm water, Storm runoff, Rainfall-runoff relationships, Mathematical models, *Rainfall forecasting, *Sewer overflow control, Case studies, San Francisco.

The San Francisco Master Plan for Wastewater Management was used as a case study to evaluate real-time, short-term rainfall forecasting as a valuable input to more effective performance of a variety of urban water management activities such as controlling the incidence of untreated combined sewer overflows. The forecasting model is described, and an indication is offered of what kinds of forecast errors can be expected for the San Francisco area. An attempt is then made to tie these results to some concurrent work on measuring the performance of a simulated real time automatic control system as a function of degree of forecast error. For this last task inflow hydrographs with a range of error deviations from the real event input to the control model in order to determine what effect these errors would have on the performance of the resulting control strategies. A split data technique was used to gain insight into expected forecast errors for selected overflow producing storms varying from high intensity-low duration to low intensity-high duration. These results were compared with the performance of the planned system. The results of a limited number of simulation runs indicated that expected forecast model errors are generally lower than the error threshold above which reactive policies become more attractive. (Baker-FRC)
W82-03075

CORRELATION OF OXYGEN 18 IN PRECIPITATION WITH TEMPERATURE AND ALTITUDE,

Bern Univ. (Switzerland). Physikalisches Inst.
U. Siegenthaler, and H. Oeschger.
Nature (London), Vol 285, NO 5763, p 314-316, May 29, 1980. 3 Fig, 1 Tab, 10 Ref.

Descriptors: *Oxygen, *Precipitation, *Temperature, Altitude, *Switzerland, Chemistry of precipitation, Oxygen isotopes, Climates, *Isotopes studies, Water vapor, Rainfall, Alps.

Although the O18/O16 ratio in precipitation is correlated to climatic parameters, the meteorological processes determining the stable isotope composition of precipitation are complex and not fully understood. Monthly samples collected at five stations in the network of the Swiss Meteorological Service permit correlation of meteorological data with O18/O16 results. Three of the stations are located at various altitudes in a valley, one is located away from the direct influence of the mountains, and one is on the southern side of the Alps. The long-term mean values of O18 variations were relatively well correlated with temperature at different stations. There is also a good correlation between the variation in O18 and altitude for locations on the Swiss plateau and in the Western Alps. Lower isotopic values were found on the lee side of a mountain range than on the weather side. Analysis of monthly data demonstrates that temperature alone cannot explain the whole variability of O18. O18 enrichment due to evaporation of the falling raindrops depends on the prevailing vapor pressure and is therefore more effective at higher temperatures. The evaporative altitude effect is expected to be larger in summer than in winter as a result of the assumed poor O18 enrichment of snowflakes. The relationship between the variation in O18 and temperature can be partly explained by considering the formation of precipitation as a Rayleigh process. Additional studies over larger geographical areas are needed to increase understanding of the processes affecting 108 variation in precipitation. (Carroll-FRC)
W82-03203

SIZING OF URBAN FLOOD CONTROL PONDS,

University of the Witwatersrand, Johannesburg (South Africa). Hydrological Research Unit.
M. D. Watson.
Civil Engineer in South Africa, Vol 23, No 5, p 183-189, May, 1981. 4 Fig, 1 Tab, 10 Ref.

Descriptors: *Flood-control storage, *Model studies, Flood protection, Floodproofing, Ponds, Flood hydrographs, Flood control, Urban watersheds.

Proper usage of ponds for flood control is discussed. The storage volume in the pond is usually designed to reduce the peak discharge of a given recurrence interval to a predetermined level. Given the available pond volume, perhaps predetermined by site conditions, the reduction in peak flow that can be achieved for various recurrence intervals may be assessed. If the outflow rate is assumed to be constant, then for an inflow of a given duration, the required storage volume needed may be determined. As a final step in flood control structure design, an analysis should be made of the continuous record of stream flows, routing them through the proposed storage structure and determining the frequency of functional failure. If flow data are not available, continuous simulation of a long rainfall record may be used to synthesize inflows. In most cases, however, continuous records of neither flow nor rainfall are readily available, and the designer has to resort to synthesizing a design storm which must then be routed through the catchment. After satisfying depression and infiltration losses, it will yield the inflow hydrograph of a certain recurrence interval. This procedure is repeated for different storm durations and storm types to determine the critical inflow hydrograph. Implicit in this procedure is the assumption that storm and runoff recurrence intervals are the same. This method neglects catchment routing and in this respect is conservative. It also assumes that outflow rate is constant. Despite these limitations, the method is a valuable tool for preliminary designs. It allows assessment of the feasibility of a flood control pond without excessive calculations. Its application for final design should be limited to small ponds and applied with conservative estimation of the runoff coefficient. (Baker-FRC)

RAINFALL CATCH ERRORS ASSOCIATED WITH CIRCUMAMBIENT OBSTRUCTIONS,

West Virginia Univ., Morgantown.
E. W. Repa.
PhD Dissertation, 1981. 186 p, 33 Fig, 25 Tab, 40 Ref, 7 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-18414.

Descriptors: *Rainfall, *Rain gages, Rainfall distribution, Rainfall intensity, Measuring instruments, Circumambient obstruction.

Point measurements of rainfall are inherently inaccurate because of numerous and interacting observational. instrumental, and gage exposure errors. When openings in the forest canopy are made for the purpose of establishing a surface gaging station, rainfall distribution at ground level is not the same as it would have been at canopy level, and site related errors of additional unknown magnitude are introduced. The magnitude of these site errors has remained a matter of opinion because there is not any reliable experimental data from comparative observations in closely spaced forest openings of various dimensions. It was the purpose of this study to determine the effects of circumambient obstructions on rainfall catch. Results showed that gage catch was a function of screening angle, where the average maximum catch occurred at an angle of 26.57 deg. Rainfall catch decreased sharply as screening angles increased from 26.57 deg, and decreased slightly as screening angle decreases. Increased wind speeds, and decreased rainfall intensities, resulted in larger rainfall catch deficits especially for larger screening angles. Theoretical catch, as determined from Weiss' (1963) and Best's (1950) equations, was found to accurately predict actual catch except for very high intensities. (Sinha-OEIS)
W82-03021

METEOROLOGY OF IMPORTANT RAINSTORMS IN THE COLORADO RIVER AND GREAT BASIN DRAINAGES,

National Weather Service, Silver Spring, MD. Office of Hydrology.
E. M. Hansen, F. K. Schwarz, and J. T. Riedel.
National Oceanic and Atmospheric Administration Hydrometeorological Report No 50, December, 1981. 188 p, 121 Fig, 16 Tab, 53 Ref, 3 Append.

Descriptors: *Probable maximum precipitation, *Rainstorms, *Rainfall distribution, *Tropical cyclones, Atmospheric water, Rainfall intensity, Seasonai variation, Spatial distribution, *Meteorology, *Colorado River basin, *Great Basin.

Significant meteorological characteristics of storms, both general and local, and moisture sources that contribute to the understanding of extreme precipitation in the Colorado River and Great Basin drainages, and to the development of probable maximum precipitation (PMP) estimates were studied. A general storm produces significant precipitation over at least several hundred square miles and lasts at least a day. Significant general storms for this report can be classified into two groups: tropical storms, and extratropical storms. Based on general storms of record, it is considered that a hypothetical more extreme tropical cyclone could be the most extreme rain-producer over a larger portion of the southwestern states during August or September. The extratropical storms, in addition to being the controlling storm type for some portions of the Southwest, are also important for producing maximum precipitation in all areas of the Southwest for months other than those when tropical storms control. The general storm PMP for southwest Wyoming is most likely a storm with moisture from the Gulf of Mexico. A local storm is defined as unusually heavy rains exceeding 3.0 inches in 3.0 hr or less, that are reasonably isolated from surrounding rains. Terrain is considered to be a major factor in local storms in the Southwest, but mesoscale conditions leading to local storm PMP are likely to occur to some degree throughout the entire Southwest. Moisture availability and its geographic and seasonal distribution are important for PMP studies in this area. (Moore-SRC)

WILL THE SAHELIAN DROUGHT END IN 1985,

Centre National de la Recherche Scientifique, Marseille (France).
H. Faure, and J-Y. Gac.

Nature, Vol 291, No 5815, p 475-478, June 11, 1981. 4 Fig, 1 Tab, 29 Ref.

Descriptors: *Drought, *Rainfall, *Sahel region, Variability, Lake Chad, Senegal River, Weather patterns, Deserts, Arid regions, History, Geologic history, *Africa.

Analysis of rainfall variability in the Sahel region since the Quaternary period indicates a mean 31.3 year period between the last three droughts, with extreme conditions every 10.3 plus or minus 4 years. Extrapolating this data shows that the present drought should end in 1985, with a gradual return to maximum wet conditions about 1992. Another severe drought is likely about 2005. Data used for the background are variations in the levels of Lake Chad for the past 1,000 years, major famines and droughts for the past 300 years, and mean annual runoff and maximum height of the River Senegal at Bakel from 1903 to the present. (Cassar-FRC)
W82-03167

RECIPROCATING HAIL PROCESSES IN THE ALPS,

Consiglio Nazionale delle Ricerche, Rome (Italy). Inst. for Aerosol Nucleation.
H. M. Papee, G. L. Petriconi, and P. Ferrari.
Water, Air, and Soil Pollution, Vol 16, No 1, p 115-122, July, 1981. 4 Fig, 5 Ref.

Descriptors: *Hail, *Air pollution effects, *Thermal pollution, Statistical analysis, Precipitation, Storms, Agriculture, *Alps, *Italy.

Precipitation patterns in the Alps have demonstrated an inverse correlation between some adverse weather events which occurred in two adjacent zones. The possible effects of air pollution and thermal pollution on the weather in this area are discussed, and a model is proposed which fits the available data on agricultural losses due to hail in the Bolzano and Trento Provinces. The model makes many assumptions, including the assumption that Trento's loss is inversely proportional to Bolzano's. Also, it is assumed that surface hail effects in Trento are proportional to an exponential of the intensity of the storm which is directly proportional to the losses sustained by both Provinces or to the territory affected. While the model is simple, correlations obtained for all parameters were highly significant. More research is needed to establish precipitation anomalies due to a boom in industrialization and urbanization. (Small-FRC)
W82-03227

THE RELATIONSHIP BETWEEN TOTAL PRECIPITABLE WATER AND SURFACE DEW POINT,

Instituto de Pesquisas Espaciaia, Sao Paulo (Brazil).
Y. Viswanadham.
Journal of Applied Meteorology, Vol 20, No 1, p 3-8, January, 1981. 8 Tab, 15 Ref.

Descriptors: *Atmospheric water, *Estimating equations, *Dewpoint, Water vapor, Precipitation, Probable maximum precipitation, Correlation analysis, *Southern hemisphere.

A method is provided for estimating the large-scale distribution of Southern Hemisphere atmospheric water vapor that is comparable to one previously developed for Northern Hemisphere data. Mean monthly and annual values of total precipitable water were compared with similar values of surface dew point for each 5 deg latitude circle from the equator to 85 deg S. The correlation coefficients were always positive but widely variable (0.21-0.99). The estimates of precipitable water from mean monthly surface dew-point temperature were not sufficiently reliable to justify making surface measurements to infer existing precipitable water. For some areas and seasons, large errors were found. Thus, the predicting equation has no value for those stations where a significant correlation does not exist between the two variables. There is no satisfactory substitute for direct measurement, and much more data collection is needed in the Southern Hemisphere. (Small-FRC)

QUANTIFICATION OF RAINFALL AND ITS UTILIZATION EFFICIENCY IN RAJASTHAN,

Central Arid Zone Research Inst., Jodhpur (India).
H. S. Mann, B. V. Ramana Rao, and G. G. S. N. Rao.
Journal of Arid Environments, Vol 4, No 2, p 107-113, June, 1981. 3 Fig, 6 Tab, 8 Ref.

Descriptors: *Water use efficiency, *Arid lands, *Water requirements, Rainfall-runoff relationships, Agriculture, *Rajasthan, *India, Semiarid lands, Runoff.

Rainfall utilization efficiency averaged 52.3% for Rajasthan, India, an arid to semi-arid region. Efficiency was low (< 30%) in the arid districts with low and erratic rainfall and 30-50% in semi-arid districts with unbalanced land use. The total amount of water not used for productive purposes in Rajasthan was 64055.76 million cu meters per year. The theoretical crop yield if all this water used is 3.71 million metric tons of pearl millet. These figures were obtained by adding the water requirements for livestock, humans, crops and vegetation, water lost through runoff and deep drainage, and subtracting from annual rainfall, 154168.64 million cu meters. Average annual flow of rivers in the region is 20505 million cu meters. (Cassar-FRC)

DEW FALL IN THE DRY CLIMATIC ZONES OF INDIA,

Andhra Univ., Waltair (India). Dept. of Meteorology and Oceanography.
A. R. Subramaniam, and A. V. R. K. Rao.
Journal of Arid Environments, Vol 4, No 2, p 103-106, June, 1981. 3 Fig, 1 Tab, 3 Ref.

Descriptors: *Dew, *Arid regions, *India, Precipitation, Rainfall, Seasonal variation, *Humid areas, *Semiarid climates, Comparison studies, Meteorological data collection.

Dew fall, an important meteorological factor in dry regions, was studied at six stations throughout India (in arid, semi-arid, and dry sub-humid areas). Measurements were recorded at four heights (5, 25, 50, and 100 cm). Maximum dew fall at Bikaner (humid), Arogyavaram (semi-arid), and Raipur (dry sub-humid) was in November-December; for Bellary (arid), September; Kota (arid), October; and Surat (sub-humid), October and February. Mean monthly dew falls during the dew season were: Bellary, 4.7 mm; Arogyavaram, 10.4 mm; and Raipur, 23.2 mm. At these 3 stations more than 80% of total dew fell from November to January, and the maximum amount of dew was deposited at the 100 cm height. During 1975-76 no rain fell during the dew season at Raipur; dew fall, the sole source of moisture, was 106% of normal rainfall. (Cassar-FRC)

ACID PRECIPITATION IN THE PITTSBURGH, PENNSYLVANIA AREA,

Pittsburgh Univ., PA. School of Public Health.
A. Roffman.
Journal of Environmental Sciences, Vol 23, No 2, p 33-37, March, 1980. 1 Tab, 1 Fig, 24 Ref.

Descriptors: *Acid rain, *Rainfall, *Air pollution, *Hydrogen ion concentration, *Lakes, Precipitation, Atmosphere, sulfuric acid, Nitrogen, Fertilizers, Ecosystems, International commissions, Organizations, Fish populations, Coniferous forests.

A survey of the pH levels of precipitation in the Pittsburgh area was conducted. Supplementary climatological data was collected. Results indicate that the pH values of samples in pollution-free areas were lower than those obtained at polluted stations. The industrial mills along the principal rivers seem to have had little or no effect on the pH values measured. The coal-burning power plants appear to have influnced the pH of precipitation. The data imply that pollution-carrying winds from the Ohio River Valley Basin contribute acidity to the stations. (Titus-FRC)

FLOW CHARACTERISTICS BELOW FLOATING COVERS WITH APPLICATION TO ICE JAMS,

Iowa Univ., Iowa City.
M. Gogus.
PhD Thesis, December, 1980. 186 p, 47 Fig, 1 Tab, 38 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-14257.

Descriptors: *Flow characteristics, *Ice jams, Mathematical models, Rivers, Interfaces, Friction, Roughness coefficient, Model studies.

Mathematical models for wide-river jams have been developed. Besides two mechanisms (i.e., floe submergence and partial collapse) for the control of the jam equilibrium thickness, there is a third one - instability of floes along the jam underside. This flow instability phenomenon was the subject of a laboratory investigation, the results of which are presented in the first part of this study. The second part of the study is concerned with the characteristics of flow between boundaries of different roughness, with the upper one floating at the surface of an otherwise open channel, and focuses on the effect of one boundary on the friction characteristic of the other. Jam calculations must include computation of the resulting backwater curve, and require estimates of the shear stresses exerted both on the channel bed and on the jam underside. The goals of the study on flow characteristics between boundaries of different roughness is two-fold: to investigate the interaction between boundaries as far as the friction factor is concerned; and to devise a procedure for estimating the friction parameters at both boundaries for given flow conditions and roughness characteristics. ON ANTARCTIC GLACIOLOGY: ICE SHEETS--AND ICE CORES,

Northwestern Univ., Evanston, IL.
J. Weertman, and D. A. Peel.
Nature (London), Vol 294, No 5838, p 210-212, November 19, 1981. 2 Fig.

Descriptors: *Ice, *Chemical analysis, Carbon dioxide, Nitrates, Polar regions, *Antarctic, Glaciology, Cryology, Sulfates.

At the International Symposium on Antarctic glaciology, results were reported from research projects concerned with virtually all parts of the Antarctic continent, in oceanic islands neaar the continent, and on sea ice that surrounds it. The topography of the Antarctic ice sheets has been partially surveyed from satellites, by seismic sounding and by radar sounding. The symposium opened with sessions addressed to the problem of ice sheet stability. Other research was directed toward the effects of a carbon dioxide buildup and whether it will make the Antarctic ice more or less stable. Carbon dioxide concentrations in the air were lower during the last ice age than they are now. The major impurity of Antarctic ice is sulfate, and the mechanism by which it reaches the region is not yet fully explained. Difficulties are also being presented by the presence of nitrates in the ice. Elevated nitrate-nitrogen levels appear to coincide with years of solar flare activity peaks which are associed with high auroral activity. Pronounced seasonal variations with maxima in winter months could be due to summer photochemical destruction of much of the nitrates. (Baker-FRC)

THEORY OF THE DIELECTRIC CONSTANT OF ICE,

Southampton Univ. (England). Dept. of Chemistry.
D. J. Adams.
Nature (London), Vol 293, No 5832, p 447-449, October 8, 1981. 1 Fig, 1 Tab, 19 Ref.

Descriptors: *Electrical properties, *Ice, Water, Physical properties, Mathematical studies, Mathematical models, *Model studies, *Comparison studies.

The theory of the dielectric constant of ice is discussed and a resolution of the internal field problem is proposed. Two rival theorteical expressions for the dielectric constant in terms of the dipole moment deal with different physical situations. The theory proposed here is that the correlations found in the perfect ice-rules model are to a good approximation the same as those that long-range dipole-dipole interactions will produce. It is demonstrated that the Fowler-Pauling ice-rules model of ice behaves like a dielectric material; matching the results of calculations on this model to experiment gives a dipole moment of 3.0 D. SOME BASIC EXPERIMENTS WITH A VERTICALLY-INTEGRATED ICE SHEET MODEL,

Royal Netherlands Meteorological Inst. De Bilt.
J. Oerlemans.
Tellus, Vol 33, p 1-11, 1981. 12 Fig, 1 Tab, 17 Ref.

Descriptors: *Ice, *Actic, *Model studies, Glaciers, Climates, *Climatology.

Large scale behavior of ice sheets is investigated, as it is immediately relevant from the viewpoint of dynamic climatology. A simple 1 1/2 dimensional continental ice sheet model is presented, using as a basis Nye's proposal to express the vertical mean horizontal ice velocity. The results are theoretical; real case studies have yet to be carried out. The findings give insight into the effects of geometry and orography which can be applied to real situations. The diffusivity increases with both ice thickness and surface slope. Using various boundary conditions and parameterization of the annual mass balance, a series of experiments was carried out. It appeared that the boundedness of continents and bedrock elevations created a strongly nonlinear response of ice sheets to climatic variations. The behavior of Northern Hemisphere ice sheets as computed with the numerical model is compared to that predicted by a perfect-plasticity model. Including bedrock sinking in a simple way reveals that this causes Northern Hemisphere ice sheets to dissappear spontaneously within 15,000 years, after about 50,000 years of growth, initiated by a cold period. WEST ANTARCTIC ICE SHEET FLUCTUATIONS IN THE ANTARCTIC PENINSULA AREA,

Aberdeen Univ. (Scotland). Dept. of Geography.
D. E. Sugden, and C. M. Clapperton.
Nature (London), Vol 286, No 5771, p 378--381, July 24, 1980. 3 Fig, 17 Ref.

Descriptors: *Antarctic, *Glacial drift, *Geomorphology, Glaciers, Polar regions, Ice formation, Moraines, Prediction, *West Antarctic ice sheet.

Previous studies have concluded that the West Antarctic ice sheet is inherently unstable since much of it is grounded below sea level. It has been suggested that the ice sheet has withdrawn from its late Wisconsin maximum position, grounded at the edge of the continental shelf, and is currently undergoing collapse as a delayed response to the warming trend and rising sea levels of the Holocene. Rising carbon dioxide levels in the atmosphere are seen as likely to cause the ice sheet to collapse in the near future. A variety of geomorphologic evidence from Alexander Island and the Antarctic Peninsula does not support either of these hypotheses. Examination of moraines on the island and peninsula indicate that there was less ice on Alexander Island and the Antarctic Peninsula following the Wisconsin maximum about 8,000 years ago than there is now. The ice shelf in George VI Sound, which lies between these two bodies of land, has built up subsequent to this period. These findings indicate that the ice sheet has expanded during the last 8,000 years and that the West Antarctic ice sheet is able to survive without the presence of the George VI ice shelf. There is no reason to fear imminent collapse of the West Antarctic ice sheet due to climatic warming as long as the ice shelf survives. (Carroll-FRC)

OPERATIONAL ESTIMATES OF LAKE SUPERIOR EVAPORATION BASED ON IFYGL FINDINGS,

National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
J. A. Derecki.
Water Resources Research, Vol 17, No 5, p 1453-1462, October, 1981. 4 Fig, 8 Tab, 16 Ref.

Descriptors: Lakes, *Evaporation, *Lake evaporation, *Lake Superior, Great Lakes, Water loss, Mass transfer, Estimating.

This paper tests the findings of studies of the International Field Year for the Great Lakes (IFYGL) on evaporation in Lake Superior and describes an improved mass transfer technique, based on atmospheric stability considerations, that can be applied to any large lake in different climatic conditions. Due to the extensive ice cover on Lake Superior during winter, the method includes ice cover reduction of standard overwater mass transfer evaporation to indicate actual winter evaporation from the lake. Method improvements consist of refinements in the mass transfer coefficient and the land-to-lake data adjustments derived from extensive investigations. Mass transfer evaporation estimates were verified by the water budget determinations, which for Lake Superior offer firm estimates of evaporation but are impractical for operational applications because of the long delays which occur in the availability of data. All hydrologic components of the Lake Superior water budget were of the same order of magnitude, with comparable errors, eliminating the possibility of large residual errors in computed evaporation. Evaporation values as determined by the two methods agree reasonably well for both seasonal distribution and the annual total, with a resulting long term annual value of approximately 500 mm. The ice cover adjustment reduced the average annual mass transfer overwater evaporation by 13% and produced much better agreement with the water budget seasonal distributions and annual values. In general the ice cover reduction of evaporation could be estimated by reducing the lake area by appropriate ice cover. (Baker-FRC)

EVAPORATION FROM VEGETATION IN LANDSCAPES DEVELOPING SECONDARY SALINITY USING THE VENTILATED CHAMBER TECHNIQUE, III. EVAPORATION FROM A PINUS RADIATA TREE AND THE SURROUNDING PASTURE IN AN AGROFORESTRY PLANTATION,

Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
E. A. N. Greenwood, J. D. Beresford, and J. R. Bartle.
Journal of Hydrology, Vol 50, No 1/3, p 155-166, March, 1981. 5 Fig, 2 Tab, 8 Ref.

Descriptors: *Evaporation, *Soil-water-plant relationships, *Trees, Evapotranspiration, Transpiration, *Pinus radiata, Pastures.

Evaporation was measured one day a month over 14 months on a 16 meter Pinus radiata tree enclosed in a ventilated chamber and on underlying pasture enclosed in a horizontal chamber. Evaporation from the tree ranged from 10 liters per day (0.6 mm per day) in April, May, and June to 170 liters per day (3.3 mm per day) in September. The pasture evaporation ranged from zero during the dry season to 1.4 mm per day in October. Xylem pressure potentials, measured on the enclosed tree and a nearby tree, were always within 1 bar of each other, limiting transpiration during the 6 month dry season. (Cassar-FRC)

THE INFLUENCE OF PLANT WATER STRESS ON STOMATAL CONTROL OF GAS EXCHANGE AT DIFFERENT LEVELS OF ATMOSPHERIC HUMIDITY,

Lancaster Univ., Bailrigg (England). Dept. of Biological Sciences.
O. Osonubi, and W. J. Davies.
Oecologia, Vol 46, No 1, p 1-6, July, 1980. 5 Fig, 27 Ref.

Descriptors: *Soil-water-plant relationships, *Stomatal transpiration, *Water stress, Transpiration, Birch, Gmelina, Plant water potential, Drought, Vapor pressure, Humidity.

The influence of plant water stress on stomatal humidity responses of two woody species was studied. Leaves of well-watered and mildly water stressed seedlings of birch (Betula pendula Roth) and Gmelina arobores L. were subjected to vapor pressure deficits between 10 and 24 kPa. An increase in vapor pressure deficit in mildly stressed birch plants decreased stomatal conductance, maintained bulk leaf turgor, and increased efficiency of water use. Stomatal conductance of Gmelina seedlings, well watered or mildly stressed, showed no significant change when humidity of the air was varied. In Gmelina water use efficiency was high when stomata were open. Stomata of Gmelina seedlings began closing at a water potential of -1.0 MPa; birch, at -1.4 MPa. Closure was complete in Gmelina at -1.5 MPa and in birch at -1.8 MPa. Under conditions of water stress, growth of Gmelina is markedly reduced, but birch is capable of some growth under mild drought. A MODEL OF DISCONTINUOUS MEASUREMENT ERROR AND ITS EFFECTS ON THE PROBABILITY DISTRIBUTION OF FLOOD DISCHARGE MEASUREMENTS,

Wisconsin Univ.-Madison. Dept. of Civil and Environmental Engineering.
K. W. Potter, and J. F. Walker.
Water Resources Research, Vol 17, No 5, p 1505-1509, October, 1981. 3 Fig, 15 Ref.

Descriptors: *Model studies, *Error analysis, Floods, Errors, Flood frequency, *Flood discharge, Flood forecasting, Mathematical models, *Flow rates.

In this paper a very simple model of discontinuous measurement error (dme) is developed and used to demonstrate that as a result of dme the probability distribution of measured floods can be greatly distorted with respect to the parent population. In particular, the population coefficients of variation, skewness, and kurtosis of the measured discharges can be significantly higher than the corresponding population coefficients of the actual flood discharges. This can be extremely important in flood frequency analysis. (Baker-FRC)

PROGRAMMING MANUAL FOR MOBED - AN UNSTEADY, NONUNIFORM, MOBILE BOUNDARY FLOW MODEL,

Canada Center for Inland Waters, Burlington (Ontario).
B. G. Krishnappan.
1981. 107 p, 22 Fig, 5 Tab, 3 Append.

Descriptors: *Sediment transport, *Mathematical models, *Unsteady flow, *Uniform flow, Hydraulic models, Manuals, MOBED, Hydraulic structures, Sediments, Dredging, Input data cards, *Channel flow.

In this manual, a mathematical model to predict the unsteady flow characteristics in mobile boundary channel flows (MOBED) is described. This manual is intended for potential users of this model and it contains descriptions of the underlying theory, numerical technique, program structure, input data requirement and format, model listing and an example of the model application. The model MOBED can be used for predicting both the short and long term effects of changes to the regime of a natural stream imposed by man and/or nature and hence could form a useful tool in the field of water resource management. A PERSPECTIVE STUDY OF DROUGHTS IN MEXICO,

National Water Planning Commission, Mexico City.
J. Sancho, and D. Perez Gavilan.
Journal of Hydrology, Vol 51, No 1/4, p 41-55, May, 1981. 4 Fig, 12 Ref.

Descriptors: *Drought, *Agriculture, History, Statistical analysis, Social aspects, Social impact, Economic aspects, *Mexico.

A historic study was conducted to outline the manifestations and consequences of droughts during the entire history of Mexico, followed by a statistical analysis to investigate the extent, duration, frequency and magnitude of droughts in that country. Historically, droughts affected not only the health of the people, but their economic and social structures as well. In every case of poor harvests and rising costs of basic foods, the consequences of the natural phenomena were aggravated by social factors. Scarcity and high costs were increased by speculation and market monopolies. Large migratory movements occurred. The partial or total suspension of non-agricultural activities such as mining, manufacturing and textile crafts, along with migration and unemployment, increased criminality and social tensions. The statistical analysis has yielded some inferences about drought behavior, although it is still not possible to predict the occurrence of a drought on an annual or seasonal basis. A base network of 157 rainfall gauging stations was established throughout the country, and a minimum of twenty years of records were maintained. The variability of precipitation was found to be a good indicator of drought risk; the greater the risk, the greater the variability. It was observed that different percentages of normal precipitation were recorded for 1, 2, 3 or 5 continuous years at each station. Curves were constructed for the entire country which define the characteristics of extent, magnitude, duration and frequency of precipitation deficiency. Varying intensity classifications were able to be applied to droughts occuring over the past 40 yr. (Baker-FRC)

COMMUNICATION ON 'VARIATION OF MANNING'S N ROUGHNESS COEFFICIENT WITH FLOW IN OPEN RIVER CHANNELS'.

Journal of the Institution of Water Engineers and Scientists, Vol 35, No 1, p 94-95, January, 1981.

Descriptors: *Mannings equation, *Roughness coefficient, *Streamflow, Sediment transport, Channel morphology, Flows, Rivers, *Open-channel flow.

A paper by Sargent on variation of Manning's n computed for five gaging stations on 5 different rivers showed substantial increase in n at low stages and a smaller constant value at higher stages at bankfull conditions were approached. The author recommended extending gaging station calibration curves beyond the highest measured level for flow contained within the channel banks. These conclusions aroused several comments that their value would be enhanced by considering changes in channel shape, sediment transport, and bed configuration changes. (Cassar-FRC)

THE MADRID BASIN AQUIFER: PRELIMINARY ISOTOPIC RECONNAISSANCE,

Madrid Univ. (Spain). Dept. of Geology and Geochemistry.
F. L. Vera, J. C. Lerman, and A. B. Muller.
Journal of Hydrology, Vol 54, No 1-3, p 151-166, December, 1981. 5 Fig, 6 Tab, 23 Ref.

Descriptors: *Aquifers, *Isotopic tracers, *Model studies, *Flow profiles, *Groundwater dating, Groundwater movement, Isotope studies, Carbon, Oxygen, Flow pattern, Radioisotopes, Water analysis, Groundwater basins, Groundwater recharge, Geohydrology, *Madrid Basin aquifer, Spain.

C and O isotopic studies were carried out on the Madrid Basin aquifer to corroborate a three-dimensional groundwater flow model of this groundwater system. Results showed that both recharge and discharge have sigma-values close enough to indicate that climatic conditions of the basin have been relatively stable. Local analyses done by aquifer tests showed that hydraulic conductivities calculated from the radiocarbon ages are of the correct order of magnitude. No evidence was found to support the previous hypothesis of large regional flow. On the contrary, the radiocarbon ages of the waters in the wells analyzed seem to support the existence of local flow in the Madrid aquifer. Other factors such as carbon precipitation or dilution and subsurface radiocarbon production which might influence the radiocarbon ages are also being studied. (Geiger-FRC)

NUMERICAL STABILITY AND ACCURACY OF IMPLICIT INTEGRATION OF FREE SURFACE GROUNDWATER EQUATIONS,

Cornell Univ., Ithaca, NY.
P. L-F. Liu, and J. A. Liggett.
Water Resources Research, Vol 16, No 5, p 897-900, October, 1980. 7 fig, 4 Ref.

Descriptors: *Darcys Law, *Laplace equation, *Mathematical studies, *Flow, *Groundwater, Algorithms, Numerical analysis, Fourier analysis, Finite difference equation, *Groundwater movement, Porous media.

In the solution of two- or three-dimensional free surface flow the time-dependent boundary condition is represented in an implicit finite difference form. The numerical solution may damp or amplify the real solution or contain oscillations, either stable or unstable, about the real solution, depending on the weighting factor and the wave number of the solution mode. Zero numerical damping occurs when the weighting factor has a value between 0.5 and 0.6. The exact value depends on the wave number and length of the time step. The weighting factor and time step are chosen by performing stability analysis on a linearized system of equations and extrapolating the results to the nonlinear system. (Titus-FRC)
W82-03060

A NUMERICAL METHOD FOR THE CALCULATION OF THE AVERAGE DRAWDOWN IN A FULLY PENETRATING OBSERVATION WELL IN AN UNCONFINED AQUIFER,

Council for Scientific and Industrial Research, Pretoria (South Africa).
L. Rolfes.
Water Resources Research, Vol 16, No 5, p 887-890, October, 1980. 2 Tab, 4 Ref.

Descriptors: *Aquifers, *Drawdown, *Unconfined aquifers, *Permeability, *Numerical analysis, Mathematical methods, Computer applications, Computer models, Algorithms, Wells, Observation wells.

A numerical method which is numerically stable and makes use of a convergence acceleration algorithm is proposed for the calculation of Neuman's formula for the average drawdown in an observation well completely penetrating an unconfined aquifer. The unconfined aquifer integral was evaluated for various values of three parameters, and results were compared with those of the Neumann method in terms of accuracy and computer execution time. The results of both methods are comparable in accuracy, but the proposed method requires less computer time. (Titus-FRC)

MODELING DOUBLE AQUIFER FLOW USING A COMPREHENSIVE POTENTIAL AND DISTRIBUTED SINGULARITIES 1. SOLUTION FOR HOMOGENEOUS PERMEABILITY,

Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
O. D. L. Strack, and H. M. Haitjema.
Water Resources Research, Vol 17, No 5, p 1535-1549, October, 1981. 17 Fig, 23 Ref.

Descriptors: *Model studies, *Permeability, Aquifers, Aquifer characteristics, Flow, *Aquifer systems, Groundwater flow, *Groundwater movement.

A technique is presented for modeling two-dimensional horizontal flow in a system of two infinite aquifers. The technique proposed is based upon the use of line sinks for incorporating creeks, lake boundaries, rivers, and canals into the model. The potentials for the elements are used as functions of a complex variable and are Cauchy integrals along finite line elements of the type discussed by Muskelishvili. The method is incorporated into the computer program SYLENS (steady flow with a lens) that is used to model a system of two aquifers divided by a thin impervious bed and hydraulically connected through the openings in the separating layer. The analysis in this paper is restricted to the case that the permeabilities in the two aquifers may be different from each other but do not vary with position. The aquifers are separated by a thin impermeable layer and are hydraulically connected through openings in the separating bed. The upper aquifer is unconfined, and the flow in the lower aquifer is confined in some regions and unconfined in others. The method is validated against various exact solutions, and some examples of applications of the method are discussed. (Baker-FRC)
W82-03078

BIEM SOLUTIONS TO COMBINATIONS OF LEAKY, LAYERED, CONFINED, UNCONFINED, NONISOTROPIC AQUIFERS,

Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
O. E. Lage, J. A. Liggett, and P. L-F. Liu.
Water Resources Research, Vol 17, No 5, p 1431-1444, October, 1981. 17 Fig, 1 Tab, 16 Ref.

Descriptors: *Aquifers, *Mathematical models, Model studies, Water table aquifers, *Aquifer characteristics, Leaky aquifers, Layered aquifers, *Groundwater movement, Aquifer systems, Confined aquifer, Unconfined aquifers, Nonisotropic aquifers.

A study was made to develop a program which could solve a variety of groundwater problems, including many of the complexities found in actual aquifers, while retaining insofar as possible the advantages of the boundary integral equation method (BIEM). In complex aquifers it is necessary to solve nonlinear equations and equations with nonconstant coefficients. The nonhomogeneous equations are solved by use of efficient and automatic area integrations. Matrix substructuring is used to decrease computer requirements for large, complex problems and also to maintain efficiency. Solutions in leaky, layered aquifers are found by iteration. Thus the advantages of the BIEM are available for the solution of complex systems. In the calculations presented here the effective dimension of an aquifer system is reduced to two by the use of the Dupuit assumption. The BIEM further reduces the computational dimension by one. Thus a three-dimensional problem is solvable by line integration. An additional major advantage of the BIEM method is the ease of data preparation in that the analyst needs to supply a minimum of data. The total storage requirements for the BIEM are also less than they would be for

domain methods. The program may thus be more available for use on small computing systems. (Baker-FRC)
W82-03079

ON THE COMPUTATION OF DARCIAN VELOCITY AND MASS BALANCE IN THE FINITE ELEMENT MODELING OF GROUNDWATER FLOW,

Oak Ridge National Lab., TN. Environmental Sciences Div.
G-T. Yeh.
Water Resources Research, Vol 17, No 5, p 1529-1534, October, 1981. 8 Fig, 3 Tab, 10 Ref.

Descriptors: *Model studies, *Groundwater movement, Flow, Mathematical models, Darcy's law, Mathematical studies, *Finite element method, Velocity.

Darcian velocity has been conventionally calculated in the finite element modeling of groundwater flow by taking the derivatives of the computed pressure field. Since a continuous velocity field is required for the simulation of waste transport in the subsurface aquifer system, the conventional approach used in finite element modeling results in discontinuity of velocity at element boundaries and nodal points. It may also yield large errors in the overall mass balance computation. Thus it is necessary that the same finite element method which is employed to simulate the pressure field be applied to Darcy's law to obtain the velocity field. This will ensure a continuous velocity field and greatly reduce the overall mass balance error. The central difference Galerkin scheme yields the lowest error, as the governing equation is basically of the Laplacian type in spatial coordinates. It is proposed in this paper that the finite element procedure that is used to simulate the pressure field or the moisture content field also be applied to Darcy's law with the derivatives of the computed pressure field as the load function, thus eliminating the problem of discontinuity. (Baker-FRC)
W82-03083

MODELING DOUBLE AQUIFER FLOW USING A COMPREHENSIVE POTENTIAL AND DISTRIBUTED SINGULARITIES 2. SOLUTION FOR INHOMOGENEOUS PERMEABILITIES,

Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
O. D. L. Strack, and H. M. Haitjema.
Water Resources Research, Vol 17, No 5, p 1551-1560, October, 1981. 15 Fig, 25 Ref.

Descriptors: *Model studies, *Permeability, *Aquifer characteristics, Aquifers, Flow, *Groundwater movement.

A technique is presented for modeling two-dimensional horizontal flow in a system of two infinite aquifers. In this paper the technique is generalized to the case of inhomogeneous permeabilities. The aquifer is subdivided into regions of homogeneous permeability, with discontinuities of the permeability occurring across the boundaries of these regions. The potentials are discontinuous across the common boundaries, which are represented as polygons. Line doublets are used to create the discontinuities in the potentials without violating the condition of continuity of flow. The strengths of the line doublets are determined from the condition that the head is continuous across the boundaries of the subregions. The method is validated against exact solutions, and some applications are considered. The modeling of inhomogeneous situations by the use of line doublets is presented for a Dupuit-Forchheimer analysis, but is equally well applied to problems of three-dimensional flow and two-dimensional flow in the vertical plane. The potential to be used for the latter applications equals the permeability times the head. (Baker-FRC)

VERIFICATION OF THE POTENTIAL YIELD AND CHEMICAL QUALITY OF THE SHALLOW DOLOMITE AQUIFER IN DUPAGE COUNTY, ILLINOIS,

Illinois State Water Survey Div., Champaign.
R. T. Sasman, R. J. Schicht, J. P. Gibb, M. O'Hearn, and C. R. Benson.
Circular 149, 1981. 46 p, 26 Fig, 1 Tab, 10 Ref.

Descriptors: *Aquifers, *Dolomite, Water level, Water yield, Groundwater, *Potential water supply, Groundwater depletion, Groundwater pollution, Dewatering, Piezometers, Pumping, Chemical properties, Dissolved solids, Hardness, Sulfate, Chlorides, Sodium, Iron, DuPage County, *Illinois.

As an alternative to pumping water from Lake Michigan, the Illinois Division of Water Resources looked to the dolomite aquifer in DuPage County. Data collected over a 700-square-mile area was used to analyze the impact of continually increasing pumpage, to locate existing and potential trouble areas, and to identify areas suitable for additional pumpage. From 1966 to 1978, pumpage in DuPage County increased 91 percent from 24 to 45.8 mgd; 95 percent of the 1978 shallow aquifer pumpage, 43.5 mgd, was from the dolomite. Estimates of the potential yield of these shallow aquifers is 44.4 mgd, so the 1978 pumpage of 45.8 mgd was 103 percent of the total. Because of the heavy pumpage, water levels have lowered considerably and major sections of the aquifer system have been dewatered. The decline in water levels has resulted in their being lowered below the bedrock surface over about 9.5 square miles of DuPage County since 1966. If pumpage continues at the 1978 ratio, shallow aquifer pumpage would be about 63 mgd by the year 2000, and would cause major decreases in yields in wells and well fields countywide. The study also showed that the highest chemical concentrations in the aquifer are generally found in areas with the greatest development of aquifer pumpage and of the overlying land surface. Concentrations of total dissolved solids, hardness, sulfate, chloride, sodium, and total iron in samples from the area are quite high. Periodic studies are recommended to assess water quality programs and to keep abreast of the chemical state of the groundwater from this aquifer. (Atkins-Omniplan)

SALT-WATER INTRUSION IN A LAYERED COASTAL AQUIFER AT YORK POINT, PRINCE EDWARD ISLAND,

National Hydrology Research Inst., Ottawa (Ontario).
G. van der Kamp.
NHRI Paper No 14, IWD Scientific Series No 121, 11 p, 1981. 21 Ref, 8 Fig, 2 Tab.

Descriptors: *Water levels, *Salinity, Measurements, *Coastal aquifers, Brackish water, Freshwater, Tidal fluctuations, Hydrology, Intrusion patterns, North River Estuary, Prince Edward Island, Canada, *Saline water intrusion, Aquifers, Groundwater movement.

Detailed measurements of water levels and salinities have been carried out in a layered coastal aquifer, undisturbed by pumping, at York Point, Prince Edward Island. The position and movements of the sea water in the aquifer are analyzed in relation to density differences, and tidal, seasonal and secular changes of water levels. Separate 'wedges' of salt water were encountered in each permeable layer. In the deeper beds, fresh water has been encountered in association with anomalously low heads. This phenomenon is at least in part due to the entrainment of salt water by the seaward flow of fresh water, but the rising sea level in the area can also lead to such an effect and, in fact, may have an important bearing on the pattern of salt-water intrusion at depth. FINAL REPORT, GROUND WATER STUDY, AMES-CAMBRIDGE REACH OF THE SKUNK RIVER, STORY COUNTY, IOWA,

Iowa State Water Resources Research Inst., Ames.
M. D. Dougal.
ISWRRI-119, June, 1980. 58 p. 13 Fig, 3 Tab, 20 Ref, 3 Append.

Descriptors: *Groundwater movement, Water quality control, Data collections, *Groundwater potential, *Aquifers, Subsurface drainage, Groundwater pollution, Water table fluctuations, Land disposal, Wastewater disposal, *Water pollution control, Alternative planning, Well water.

A study of the downstream continuation of the Ames Buried Channel Aquifer from Ames to Cambridge, Iowa, was made to determine the movement of water in the flood plain area and to provide a preliminary evaluation of the potential impact of the new water pollution control plant on the community of Cambridge. Cambridge has ground water wells drilled into the buried channel aquifer. Three sites evaluated were found to be suitable as to potential impact on ground water and land suitability for disposal of digested sludge. Site 5, which consists of silts, clays, and clayey sands to a depth of 12 to 15 feet, remains the most isolated site and land disposal would affect the least number of persons and housing units. The surficial soil profile implies slow infiltration and good retention of soil moisture. The ground water levels at Cambridge are greater than the river level during normal or low flow periods, and future evaluation may be needed if increased well withdrawals reverse the positive riverward ground water gradient. One more costly alternative would be to continue the outfall five miles southward to a point about two miles south of Cambridge; however, that would require a regional scope to water quality control. Groundwater quality studies made at observation wells showed that the water quality in the aquifer is similar to that measured at Ames, and that the Buried Channel Aquifer is a valuable source of water supply. During flood periods the Ames River may cause more of a pressure wave effect and less of a water movement recharge phenomenon. If Site 5 is selected, several recommendations must be considered, such as flood protection and various monitoring programs. (Garrison-Omniplan)

RECHARGE MECHANISMS AND GROUNDWATER FLOW IN THE CHALK AND DRIFT DEPOSITS OF SOUTHERN EAST ANGLIA,

Birmingham Univ. (England). Dept. of Geological Sciences.
J. W. Lloyd, D. Harker, and R. A. Baxendale.
Quarterly Journal of Engineering Geology, Vol 14, No 2, p 87-96, 1981. 8 Fig, 5 Tab, 18 Ref.

Descriptors: *Aquifers, *Groundwater movement, *Groundwater recharge, Mathematical models, Geologic formations, Flow, Underground storage, Gravel, Anglian Water Authority, *England, Chalk deposits.

An extensive study of the hydrochemistry of groundwaters in the Chalk and drift deposits of southern East Anglia was carried out to obtain a qualitative understanding of the recharge and flow mechanisms operating in the two aquifer units. Five main water types were identified for the Chalk aquifer, and three drift environments were determined. These results were used to define a model of recharge and flow mechanisms. Recharge to the aquifer north of the London Clay boundary was concentrated along the major river valleys. Modern water containing nitrate was found only where the aquifer had a high permeability and where the flow is consequently high. Significant storage for the water abstracted from the Chalk aquifer was provided by the adjacent drift sands and gravels. South of the London Clay boundary, the drift acted as a storage reservoir and supplied an important base-flow component to the rivers. (Small-FRC)

FLOW IN AQUIFERS WITH CLAY LAMINAE 2. EXACT SOLUTIONS,

Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
O. D. L. Strack.
Water Resources Research, Vol 17, No 4, p 993-1004, August, 1981. 12 Fig, 6 Tab, 5 Ref.

Descriptors: *Error analysis, *Aquifers, *Impervious beds, *Steady flow, *Groundwater movement, *Clays, Laminar flow.

The method of determining steady flow in clay laminae-containing aquifers, developed in Part 1 of this work, is used to obtain approximate solutions of two cases. Exact solutions are also obtained, using standard complex variable techniques. The first case is confined flow in an aquifer system with an infinite lamina with a slot. The second is unconfined flow in an aquifer system with a semi-infinite lamina. In the first case there is significant error in discharge, up to plus or minus 25%. An acceptable error is found in the situation where boundary conditions are applied at distances of 15 times the aquifer thickness, or more, away from the slot. The error in the second example is less, maximum 12.7%, and may be explained by the differences in geometry. (Cassar-FRC)

FLOW IN AQUIFERS WITH CLAY LAMINAE 1. THE COMPREHENSIVE POTENTIAL,

Minnesota Univ., Minneapolis, Dept. of Civil and Mineral Engineering.
O. D. L. Strack.
Water Resources Research, Vol 17, No 4, p 985-992, August, 1981. 9 Fig, 10 Ref.

Descriptors: *Aquifers, *Steady flow, *Impervious beds, Groundwater movement, *Clays, Laminar flow, Groundwater potential, Comprehensive potential, Model studies, Permeability.

Steady flow of fresh water in an aquifer system containing thin impervious clay laminae is described. It is assumed that the laminae do not overlap. A steady state two-dimensional Dupuit-Forchheimer model predicts piezometric heads in the system. Conditions of confined, unconfined, confined interface, and unconfined interface flow may be considered in the aquifer above and below the laminae. A new potential (called the comprehensive potential) is introduced with a gradient equal to minus the vectorial sum of the discharges in the upper and lower aquifers. It is determined by solving a boundary value of the Poisson equation. Heads can be established along the edges of the clay lamina without using an iterative procedure. The analysis is applied to two cases, both involving two infinite aquifers separated by an infinite lamina. The aquifers are hydraulically connected through a circular opening in the lamina. No rainfall infiltration is present. In the first case, flows are unconfined, with a well in the lower aquifer and a recharge well in the upper. The second case has confined flows and no wells. To apply the analysis to multiple laminae the comprehensive potential technique is applied in steps, working to the innermost boundary. The method can be used when permeabilities in the upper and lower aquifers are different if the potentials in terms of heads are properly defined. (Cassar-FRC)

MOLECULAR APPROACH TO THE FOUNDATIONS OF THE THEORY OF SOLUTE TRANSPORT IN POROUS MEDIA. I. CONSERVATIVE SOLUTES IN HOMOGENEOUS ISOTROPIC SATURATED MEDIA,

Mississippi Univ., University. Dept. of Civil Engineering.
V. K. Gupta, R. N. Bhattacharya, and G. Sposito.
Journal of Hydrology, Vol 50, No 1/3. p 355-370, March, 1981. 22 Ref.

Descriptors: *Porous media, *Solute transport, *Diffusion coefficient, Model studies, Path of pollutants.

A molecular model is developed for the transport of low concentrations of a conservative solute in a homogeneous isotropic water-saturated porous medium. In this model, a solute molecule randomly collides with the solid grains in the medium and is scattered in a random direction. A parabolic differential equation for the solute concentration at the macroscopic level is derived from the molecular model. When solute connection is absent, the coefficient of molecular diffusion in a porous medium is less than the coefficient of molecular diffusion in bulk solution. For convection greater than zero the medium is assumed to be isotropic to prove that the solute dispersion tensor is diagonal. For small values of liquid velocity, the isotropicity assumption implies that the coefficients of longitudinal and transverse dispersion are approximately parabolic functions of the liquid velocity. Comparisons of derived dispersion coefficients with observed values suggest that solute-liquid molecular collisions, rather than solute molecules-solid phase grains collisions, account for the relationship between dispersion coefficients and liquid velocity. The solute convective velocity is less than or equal to the liquid velocity. (Cassar-FRC)

ANALYSIS OF FLOW THROUGH HETEROGENEOUS RANDOM AQUIFERS BY THE METHOD OF EMBEDDING MATRIX. 1. STEADY FLOW,

Tel-Aviv Univ. (Israel). School of Engineering.
G. Dagan.
Water Resources Research, Vol 17, No 1, p 107-121, February, 1981. 4 Fig, 19 Ref.

Descriptors: *Aquifers, *Flow, *Statistical models, Hydraulic conductivity, Non-uniform flow, Boundaries (Surfaces), Model studies, Hydrology, Monte Carlo method, Porous media, Earth-water interfaces, Mathematical models, *Groundwater movement, Aquifer characteristics.

This paper is a continuation and extension of Dagan's (1979) work on flow through aquifers whose properties vary in space in a random fashion. The statistical structures of the hydraulic conductivity, head gradient, specific discharge, and head fields are analyzed using a model consisting of a collection of spherical and cylindrical blocks with different conductivity and diameter, set randomly and independently in space. The influence of boundaries (regions not statistically homogeneous) and nonuniform average flows are analyzed for the first time. The growth of head variance with distance from the boundary in 2-dimensional flows is analyzed and compared with the Smith and Freeze (1979) Monte Carlo simulations. (Cassar-FRC)

FIRST ORDER ANALYSIS OF UNCERTAINTY IN NUMERICAL MODELS OF GROUNDWATER FLOW. PART I. MATHEMATICAL DEVELOPMENT,

Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
M. D. Dettinger, and J. L. Wilson.
Water Resources Research, Vol 17, No 1, p 149-161, February, 1981. 31 Ref, 3 Append.

Descriptors: *Groundwater movement, *Mathematical studies, *Model studies, Piezometry, Hydrology, Aquifers, Flow measurement.

Part 1 of this paper includes a discussion of the nature and sources of uncertainty encountered in groundwater flow models, especially numerical models. The models are cast in state-space form, with boundary conditions and inputs that are functionally dependent on, but statistically independent of, time. First and second order Taylor series expansions of the model equations are derived and used to estimate the mean and variance-covariance properties of piezometric head predictions, given corresponding statistics for aquifer parameters: material properties, initial conditions, boundary conditions, and inputs. The first order estimate of the piezometric head is identical to the deterministic result. Prediction uncertainty is a function of the magnitude of the parameter uncertainty and sensitivity of the predictions to the parameters. Part 2, to be presented later, will illustrate the effects of parameter uncertainty on predictions of heads for 1 and 2 dimensional aquifer flows. (Cassar-FRC)

FORECASTING SUBSURFACE WATER FLOW AND STORAGE ON FORESTED SLOPES USING A FINITE-ELEMENT MODEL,

M. Mohsenisaravi.
PhD Dissertation, January, 1981. 179 p, 39 Fig, 13 Tab, 151 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-19892.

Descriptors: *Model studies, *Watershed management, *Forest watersheds, Storm seepage, Forecasting, Snowmelt, Permeability coefficient, *Idaho, Finite element method.

Subsurface flow in a three soil layer vertical cross section of the Pine Creek watershed in the Idaho Batholith of central Idaho was simulated using the finite element model, UNSAT2, under uncut, clearcut, and wildfire conditions. The model was based on a two-dimensional transient saturated-unsaturated analysis of the subsurface flow at the field site. The sensitivity of subsurface outflow to various input parameters indicated that subsurface outflow was most sensitive to the magnitude of saturated hydraulic conductivity. The simulations indicated that different snowmelt events require different saturated hydraulic conductivity to simulate subsurface outflow adequately. Nomographs were made showing the changes of saturated hydraulic conductivities on control and treated watersheds under harvesting and burning situations. (Sinha-OEIS)

SOIL MORPHOLOGY AND PREFERENTIAL FLOW ALONG MACROPORES,

Soil Survey Inst., Wageningen (Netherlands).
J. Bouma.
Agricultural Water Management, Vol 3, No 4, p 235-250, 1981. 6 Fig, 53 Ref.

Descriptors: *Soil structure, *Pores, *Morphology, *Soil water, Soil physics, Soil physical properties, Soil porosity, Macropores, Flow characteristics, Tracers, Infiltration, Hydraulic conductivity, Methylene blue, Clays.

Preferential flow in saturated soil involves rapid displacement of water from macropores; and in saturated soil, flow into air-filled macropores (short-circuiting), followed by lateral absorption. Macropores, defined as pores significantly larger than those which result from packing of individual soil particles, occur in three major forms: cylindrical channels, planes, and irregular. Macropores may be studied by several methods. Field descriptions are good only for identifying major differences in soils. Schematized structure models and use of stains such as methylene blue are useful in seeing infiltration into cracked soils. Pedological features such as mottling patterns can be used as indicators for preferential flow along macropores. Micromorphology measures the features very accurately, but results apply only to the thin sections studied; techniques are expensive. (Cassar-FRC)

SOLUTION OF THE CONTINUITY EQUATION FOR THE KARNAK AREA,

Toronto Univ. (Ontario). Dept. of Chemistry.
T. C. Billard, and G. Burns.
Nature (London), Vol 285, No 5767, p 654-655, June 26, 1980. 2 Fig, 1 Tab, 6 Ref.

Descriptors: *Saline soils, *Simulation analysis, *Continuity equation, Mathematical analysis, Mathematical equations, *Egypt, Nile River, Land management, Salinity, Soil water table, Irrigation, Soil water, Environmental effects.

A computer simulation of the flow of saline water in the area of the Great Temple of Karnak (Egypt) was devised to determine whether salinization presents a serious threat to the antiquities in that region. The physical system used in the simulation is represented by a river valley between two rows of mountains impermeable to water. The temples are situated in an unirrigated region between the river and an irrigated area. Water and soluble salts from the irrigated fields are driven into the river by the difference in the levels of the Nile and the water table under the irrigated fields. Since there is no irrigation in the temple area, the evaporation of moisture at the soil surface constitutes another driving force which moves saline water from the water table to the surface, where the salts are deposited. Solution of the steady-state continuity equation provides information on the relative importance and the approximate rates of these processes for the water saturated region. A computer program, which can be used on a mini-computer, was developed and yielded a solution for the equation which was stable, consistent, and convergent. The flow results, including the amounts of salt deposited in unirrigated areas, were found to be directly proportional to the hydraulic conductivity. The height of the water table was found to be the key boundary condition. About 92 percent of the water draining from the irrigated land is evaporated on or near the surface of the unirrigated land. These results indicate that new physiochemical processes operating since the Aswan Dam was built are causing salinization of land, endangering the foundations of the temples and unexcavated antiquities. FIELD APPLICATION OF THE FOUR-ELECTRODE TECHNIQUE FOR DETERMINING SOIL SOLUTION CONDUCTIVITY,

Agricultural Research Organization, Bet-Dagan (Israel). Div. of Soil Physics.
A. Nadler.
Soil Science Society of America Journal, Vol 45, No 1, p 30-34, 1981. 6 Fig, 3 Tab, 12 Ref.

Descriptors: *Conductivity, *Soil solution, *Measurement techniques, Soil water, Calibrations, Salinity.

The four-electrode resistivity technique is used to obtain measurements of the in situ actual soil solution electrical conductivity by measuring bulk soil electrical conductivity. A procedure for determining the in situ soil solution conductivity from bulk soil electrical conductivity measurements is proposed. It comprises the preparation of calibration curves for soil solution and bulk soil conductivity in each soil under consideration using the electrical conductivity of the free draining solution instead of that of the soil solution extracts. The contributions of surface conductance to bulk soil electrical conductivity are calculated as a function of soil solution electrical conductivity using an iterative procedure. A correction factor is used that considers the relative soil volumetric water content rather than the absolute value in order to permit field measurements under a variety of soil moisture values. In situ electrical conductivity of a soil solution was calculated using the four-elctrode technique and this suggested calibration procedure, and the resultant values were compared to those for the electrical conductivity of soil solution extracts. The electrical conductivity of in situ soil solution calculated using this method was close to that of irrigation water and was always equal to or smaller than that estimated from the electrical conductivity of 1:1 soil extracts and back calculation to field water content. The electrical conductivity of soil surface ions may be greater than the electrical conductivity of soil solution ions, leading to unreasonable results when the electrical conductivity of surface ions is not properly considered. A commonly used soil extraction method for estimating soil solution electrical conductivity was shown to be highly influenced by total salt content and by soil moisture levels, emphasizing the advantages of the four-electrode method for measuring in situ soil water salinity. (Carroll-FRC)

SOIL HYDRAULIC PROPERTIES AS STOCHASTIC PROCESSES: I. AN ANALYSIS OF FIELD SPATIAL VARIABILITY,

Agricultural Research Organization, Volcani Center, Bet Dagan (Israel). Div. of Soil Physics.
D. Russo, and E. Bresler.
Soil Science Society of America Journal, Vol 45, No 4, p 682-687, July/August, 1981. 4 Fig, 2 Tab, 20 Ref.

Descriptors: *Soil properties, *Stochastic hydrology, *Permeability coefficient, Soil engineering, Stochastic processes, Statistical analysis, Spatial distribution, *Soil water, Hydraulic conductivity.

The spatial variability of certain soil hydraulic properties was examined in the field, and the spatial structures of these properties are presented in terms of the probability density functions, autocorrelation functions, and integral scales. The parameters were: saturated hydraulic conductivity, water entry value, saturated and residual water contents, and a constant which characterizes the pore size distribution of the soil. Each parameter is described at a given depth as a realization of a stationary two-dimensional isotropic and random process. The integral scale value was calculated from the autocorrelation functions for each parameter, and generally decreased with depth. The spatial variabilities of the hydraulic functions are described by the probability density functions and the autocorrelation functions. The results of integral scales and coefficients of variation from this study can be applied to evaluate errors in estimating average values of several hydraulic properties. (Small-FRC)

ANALYSIS OF LONGITUDINAL DISPERSION IN UNSATURATED FLOW I. THE ANALYTICAL METHOD,

Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
J. L. Wilson.
Water Resources Research, Vol 17, No 1, p 122-130, February, 1981. 10 Fig, 23 Ref.

Descriptors: *Unsaturated flow, *Soil moisture, *Solutes, Dispersion, *Solute transport, Infiltration, Mathematical studies, Mixing.

Analysis of solute displacement in unsaturated soils involves one-, two-, or three-dimensional flow with fixed streamlines. The transport processes are separated into 2 parts: convection with mean flow and dispersive mixing. The convection process is solved exactly, and the dispersive process approximated by singular perturbation techniques. Comparison of theoretical results and field data showed agreement. When the analytical technique is applied to solute transport during steady and transient one-dimensional infiltration, it is observed that nonuniform moisture content in space results in stretching or contracting of a solute pulse as it travels through the soil, whether or not dispersive mixing is present. In addition, for transient infiltration into initially moist unsaturated systems, the rate of solute movement in an unsaturated system is usually smaller than the rate of movement of a moisture change. (Cassar-FRC)

PONDED INFILTRATION INTO SIMPLE SOIL SYSTEMS: 1. THE SATURATION AND TRANSITION ZONES IN THE MOISTURE CONTENT PROFILES,

Sydney Univ. (Australia). Dept. of Soil Science.
W. J. Bond, and N. Collis-George.
Soil Science, Vol 131, No 4, p 202-209, April, 1981. 4 Fig, 2 Tab, 27 Ref.

Descriptors: *Moisture content, *Soil water, *Infiltration, Physical properties, Saturation zone, Saturated soils, Transition zone, Free water, Sand, Air entrainment.

Early experimental work involving both moisture content and total potential profiles conducted by Bodman and Colman (1943) resulted in the identification of five features of soil moisture content profiles: saturation zone, transition zone, transmission zone, wetting zone, and wetting front. This study was designed to measure as accurately as possible the basic physical properties of soil during ponded infiltration in simple soil systems and to describe the phenomena occurring during this process. A fine sand from which silt and clay fractions had been removed was used for this study. The experiments demonstrated that saturation and transition zones do exist in the moisture content profiles during ponded infiltration of this simple soil. The saturation zone was not found to be associated with a zone of high total potential gradient. Accepted notions concerning the encapsulation of air when porous materials containing air are wetted and the continual solution of encapsulated air by the infiltration water are used to propose a mechanism for the formation of the saturation and transition zones in simple soil systems. (Carroll-FRC)

MODELING NITROGEN TRANSPORT AND TRANSFORMATIONS IN SOILS: 1. THEORETICAL CONSIDERATIONS,

Louisiana State Univ., Baton Rouge. Dept. of Agronomy.
H. M. Selim, and I. K. Iskandar.
Soil Science, Vol 131, No 4, p 233-241, April, 1981. 7 Fig, 24 Ref.

Descriptors: *Nitrogen, *Soil profiles, Mathematical models, Finite difference methods, Nitrification, Denitrification, *Soil water, Ammonium, Flow characteristics, Soil water movement.

Soil water movement directly affects the transport of the water-soluble nitrogen species in the soil, while various organic and inorganic soil nitrogen species influence the chemical and microbiological processes responsible for the various reversible and irreversible nitrogen transformations in the soil.

Mathematical modeling of nitrogen behavior in the soil system has either considered the transport and transformation of nitrogen under steady-state water flow conditions or described the fate of soil nitrogen under nonsteady or transient water flows. The numerical model presented here simulates the transient water flow and nitrogen transport and transformations in multilayered or stratified unsaturated soil profiles. The nitrogen submodel considers nitrification, denitrification, immobilization, mineralization, and ionic exchange of ammonium, as well as uptake of nitrogen by plants. Finite difference approximation of the nitrogen transport and transformation equations is used simultaneously with the water flow equation for transient-unsaturated flow conditions in this model. Model evaluation and sensitivity analyses were conducted for a wide range of values for the rate of nitrification, distribution coefficient for ammonium exchange, and rate of nitrogen uptake. (Carrol-FRC)

ZINC DEFICIENCY IN WETLAND RICE ALONG A TOPOSEQUENCE OF HYDROMORPHIC SOILS IN THE PHILIPPINES. I. SOIL CONDITIONS AND HYDROLOGY,

International Rice Research Inst., Los Banos, Laguna (Phillippines).
N. V Van Breemen, D. D. Quijano, and L. N. Sen.
Plant and Soil, Vol 57, No 2/3, p 203-214, 1980. 2 Fig, 5 Tab, 17 Ref.

Descriptors: *Zinc, *Rice, *Philippines, *Drainage, *Soil-water-plant relationships, Hydrology, Bicarbonate, Calcium, Magnesium, Carbon dioxide, Soil gases, Hydrogen ion concentration, Arable land, Artesian wells, Subsurface waters, Percolation.

Zinc deficiency was studied along a 500 meter toposequence in volcanic soil in the Philippines. There were noticeable differences between crops and conditions in the upper and lower fields. In the higher fields (45 meters) above sea level, rice grew well. Zn content of dry soil was 0.15 mg per kg, and percolation was dominant. Dissolved Mg(2+) and bicarbonate in wet soil samples were (given as ionic equivalents in moles per cu meter):19 for 1/2Mg(2+) and 22 for bicarbonate in the highest field. In contrast, the poorly drained fields on the footslope (43 meters above sea level), with Zn levels of 0.10-0.12 mg per kg, grew poor crops. Upwelling of groundwater was present: 1/2Mg(2+) was 26-30, and bicarbonate 29-33. In the toeslope area, only grass and shrubs grew. Here, upwelling artesian well water high in dissolved CO2 (pH 6.5) produced CaCO3 precipitation. A subsequent paper will explain the relationship of these peculiar physical, chemical, and mineralogical characteristics with Zn deficiency. (Cassar-FRC)
W82-03328

PONDED INFILTRATION INTO SIMPLE SOIL SYSTEMS: 3. THE BEHAVIOR OF INFILTRATION RATE WITH TIME,

Sydney Univ. (Australia). Dept. of Soil Science.
W. J. Bond, and N. Collis-George.
Soil Science, Vol 131, No 6, p 327-333, June, 1981. 3 Fig, 15 Ref.

Descriptors: *Infiltration rate, *Ponding, *Soils, Mathematical studies, Soil water, Infiltration, Soil absorption capacity.

The behavior of infiltration rate with time during ponded infiltration into simple soil systems is examined using experimental results previously reported by the present authors. Equations defining the infiltration rate for the saturation zone and for the transmission zone are applied to data from infiltration experiments. this analysis indicates that the infiltration rate is proportional to the total potential gradient in the transmission zone throughout infiltration and that steady-state infiltration will be completely achieved only when the total potential gradient has become constant with time in the transmission zone. The apparent linearity of a measured cumulative infiltration-time relationship is shown not to be a reliable indicator of steady state. An equation based on Darcy's law, which relates the infiltration rate to the total potential gradient in the transmission zone, is derived and experimentally tested. This equation is used to demonstrate that it is impossible to achieve steady state infiltration in simple soil systems. The effect of the saturation and transition zones on the infiltration rate, and errors that occur when infiltration models neglect the existence of these zones, are illustrated using this equation. THE INFLUENCE OF HYDRODYNAMIC TRANSPORT ON PHYTOPLANKTON DYNAMICS IN HOMOGENEOUS LAKES,

Cornel Univ., Ithaca, NY.
J-T. Kuo.
PhD Thesis, January 1981. 177 p, 55 Fig, 6 Tab, 72 Ref, 3 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-10910.

Descriptors: *Model studies, *Water quality, *Lakes, *Hydrodynamics, Nutrients, Water currents, Flow characteristics, *Phytoplankton, Hydrodynamic transport, Circulation.

This research explores the influence of hydrodynamic transport on phytoplankton dynamics in lakes through the use of hydrodynamic and phytoplankton modeling. Variable horizontal and vertical dispersion (or exchange) coefficients in a finite-segment water quality model induced by large scale turbulent flow across segment boundaries may be estimated from the outputs of a lake hydrodynamic model. A steady-state lake circulation model has been demonstrated to be able to generate mean circulation patterns in homogeneous lakes. Both direction and magnitude of currents influence the distribution of phytoplankton and nutrient in the 'fine grid' model of lakes or embayment. The effect of Saginaw River inflow is of importance in the constituents distribution in Saginaw Bay, including phytoplankton. The influence of Genessee River discharge is relatively insignificant to the constituents simulation the Rochester embayment. Calculated results using a time-variable transport regime from a series of steady-state calculations with a circulation model show more variation in constituents concentration when compared to those using temporally constant flows in previous modeling analyses. The importance of hydrodynamic transport on the distribution of phytoplankton chlorophyll in lakes is dependent on the space and time scales of interest. This research demonstrates that as the horizontal grid size of a finite-segment or finite-difference large lake model increases to a certain level, the general biochemical kinetics of plankton and nutrients would dominate over the physical transport process in determining the distribution of phytoplankton and nutrients. Descriptors: *Benthos, *Lakes, *Plankton, Eutrophic lakes, Aquatic life, Benthic fauna, Benthic flora, Biomass, *Lake Qarun, *Egypt, Salinity.

Changes were investigated in the species composition, distribution and abundance of phytoplankton, zooplankton, and benthic organisms inhabiting Lake Qarun in relation to variations in the salinity of the water in different parts of the lake during the period from January 1974 to December 1977. Sampling was conducted monthly from 11 stations. The average number of phytoplankton cells was 152,300 cells/L, and its biomass was 0.365 g C/cubic meter. The average number of zooplankton was 31440/cubic meter and its biomass was 194.19 mg/cubic meter. The average number of benthic fauna was 19889/square meter and its biomass was 400.22 g/square meter. Thus Lake Qarun is a highly eutrophic body of water. When the salinity of the lake reached 30-34%, freshwater planktonic species such as Diaptomus salinus that used to inhabit the lake along with the cladoceran Moina salinarum disappeared completely. Some Rotatoria were able to withstand the high salinity. The new composition of the zooplankton community showed that the marine zooplankton species included not only Acartia latisetosa and Cirripedia nauplii, but also other species such as Polychaeta, Obelia medusae, and others. The benthos of Lake Qarun is characterized by an intensive growth of a few species. The majority of bottom fauna in the lake are Mollusca, mainly Cerastoderma glaucum, 69.84% by weight. (Baker-FRC)

EFFECTS OF DILUTION ON THE BENTHOS OF AN ALKALINE LAKE,

National Swedish Environment Protection Board, Uppsala (Sweden). Water Quality Lab.
T. Wiederholm.
Hydrobiologia, Vol 68, No 3, p 199-208, February 16, 1980. 3 Fig, 3 Tab, 19 Ref.

Descriptors: *Saline lakes, *Benthic fauna, *Irrigation effects, Lakes, *Lake Lenore, Soap Lake, *Washington, Species diversity, Eutrophic lakes, Freshwater intrusion, Ecological effects, Irrigation water, Leakage.

The salinity of Lake Lenore, in semi-arid central Washington, declined from about 17 g per liter in 1950 to 1.5 g per liter in 1975 because fresh water leaked into the lake from nearby irrigation projects. Dilution of the lake greatly increased species diversity, from a single halobiontic chironomid species in 1950 (inferred from sampling adjacent, undiluted Soap Lake) to 8 taxa in 1957 (salinity 6.7 g per liter), 10 in 1962 (salinity 2.6 g per liter), 26 in 1971 (salinity 1.9 g per liter), and 29 in 1975 (salinity 1.6 g per liter). The lake at present is well mixed, highly productive, and lacking a reproducing fish population. Concurrent increases in abundance and biomass suggest that the carrying capacity of the lake at earlier, higher salinities was not fully used by the benthic fauna. The sodium bicarbonate containing Lake Lenore at > 2-3 g per liter salinity did not support some of the taxa found in Na-Mg sulfate-type lakes at salinities up to 10 g per liter, demonstrating the importance of ion composition. THE STRUCTURE OF FRESHWATER HUMIC SUBSTANCES AS REVEALED BY 13C-NMR SPECTROSCOPY,

Lincoln Coll. (New Zealand).
M. A. Wilson, P. F. Barron, and A. H. Gillam.
Geochimica et Cosmochimica Acta, Vol 45, No 10, p 1743-1750, October, 1981. 4 Fig, 2 Tab, 44 Ref.

Descriptors: *Humic acids, *Natural waters, *Nuclear magnetic resonance, Spectroscopy, Chemical analysis, Carbon, Sediments, Soils, Fate of pollutants, Metals, Chelation.

The 13C-NMR spectra of freshwater aquatic humic substances were determined so that a comparison of aromaticity could be made between marine, freshwater and terrestrial sources. Because aquatic plants do not normally contain large amounts of lignin the results should shed light on the origin of freshwater aquatic humic substances and indicate why the materials are such excellent complexing agents for metal ions. The humic substances examined were taken from Lake Celyn, Gwynedd, North Wales. Carboxyl, aromatic, o-alkyl and alkyl resonances were recognizable.

Varying pulse delay from 0.43 to 2.5 sec had little effect on the magnitude of the signal ascribed to aromatic carbon, but there was a small nuclear Overhauser effect. The results indicate that 24% of Lake Celyn humic acid carbon was carboxyl and 40% was aromatic. The high proportion of aromatic carbon suggests that the Lake Celyn humic acid is largely formed from terrestrial humic substances from the surrounding peaty watershed. The paper presents evidence which suggests that the relative mobilities of the individual humic substances are also important. (Baker-FRC)

EUTROPHICATION OF THE LAKE-RESERVOIR SIDI MOHAMED BEN ABDELLAH, RABAT, MOROCCO (L'EUTROPHISATION DU LAC-RESERVOIR SIDI MOHAMED BEN ABDELLAH PRES DE RABAT, MAROCO),

Service Controle de Qualite des Eaux, Rabat (Morocco).
H. Abouzaid, and L. landner.
Aqua, No 6, p 345-347, 1981. 1 Fig, 1 Tab.

Descriptors: *Eutrophication, *Reservoirs, Lakes, Water quality, *Nutrients, Mathematical models, Model studies, *Morocco, Rabat.

The Lake-Reservoir Sidi Mohamed Ben Abdellah was built for the purpose of supplying water for the coastal zone between Kenitra and Casablanca. The reservoir has a volume of 550 million cubic meters with an average depth of 17 meters. The quality of the water in the reservoir has deteriorated due to eutrophication. This is clearly demonstrated by the difficulties being experienced at the water treatment plant. An intensive study has been undertaken by the National Water Office, with the help of the World Health Organization, to determine what factors are responsible for the harmful effects on water quality in the reservoir. Some of the factors studied include liquid and solid inputs, assessment of nutrients, primary production and supply chain. The study has permitted the optimization of the level of raw water intake and the linking of the hydraulic system of the dam to changes in water quality. Currently a mathematical model of the water quality of the reservoir is being developed. The model should enable the feasibility of different methods for fighting eutrophication to be studied. The model will also be able to predict water quality in the short and long term. The model will probably be adaptable to other reservoirs in Morocco as well. (Baker-FRC)

DYNAMICS OF BACTERIAL SULFATE REDUCTION IN A EUTROPHIC LAKE,

Wisconsin Univ., Madison. Dept. of Bacteriology.
K. Kingvorsen, J. G. Zeikus, and T. D. Brock.
Applied and Environmental Microbiology, Vol 42, No 6, p 1029-1036, December, 1981. 4 Fig, 2 Tab, 36 Ref.

Descriptors: *Sulfates, *Bacteria, *Growth kinetics, Lakes, *Lake Mendota, Wisconsin, Sulfur bacteria, Sediments, Lake sediments, Kinetics, Trophic state, *Sulfate reduction.

Sulfate reduction by bacteria in the surface sediments and water of Lake Mendota, Wisconsin, was studied with S35 labeled sulfate. Sulfate was reduced rapidly at the sediment surface, having a turnover time of 10-24 hours. Daily sulfate reduction rates ranged from 50 to 600 nM sulfate per cu cm. Much less sulfate reduction took place in the water; rates were 1000 times lower than in the surface sediments. Rates of bacterial sulfate reduction in the sediments were not sulfate-limited at sulfate concentrations > 0.1 nM. Optimum temperature for sulfate reduction was 36-37 C. Lake temperatures were 1 to 13 C during the study. Adding electron donors to laboratory cultures gave the following growth stimulation: hydrogen, 73% n-butanol, 59%; n-propanol, 50%; ethanol, 39%; yeast extract, 32%; glucose, 32%; n-butyrate, 32%; n-propionate, 23%; glycerol, 14%; choline chloride, 14%; acetate, zero; and lactate, zero. Bacterial sulfate reduction is very active in this lake even though it is severely temperature limited. Michaelis-Menton kinetics did not apply to the bacterial population in this lake. (Cassar-FRC)

PHOSPHORUS-LIMITED GROWTH OF A GREEN ALGA AND A BLUE-GREEN ALGA,

Alaska Univ., Fairbanks. Inst. of Water Resources.
D. S. Lang, and E. J. Brown.
Applied and Environmental Microbiology, Vol 42, No 6, p 1002-1009, December, 1981. 5 Fig, 1 Tab, 44 Ref.

Descriptors: *Phosphorus, *Algae, *Oligotrophic lakes, Lakes, Cyanophyta, Chlorophyta, Nutrients, Phosphates, Kinetics, *Growth kinetics.

A cyanophyte, Synechococcus Nageli, was better suited for growth in phosphorus-limited oligotrophic waters than a chlorophyte, Scenedesmus quadricauda. The growth kinetics were studied in batch and continuous cultures. The cyanophyte had greater steady-state phosphate transport capability and phosphorus storage capability. It also depleted phosphate to much lower levels than S. quadricauda. In a dual species continuous culture under limited phosphorus the cell dry weights for Scenedesmus reached a peak at 5 days and declined to zero by 28 days. Synechococcus cell dry weights increased from nearly zero at 7 days to a peak at 17 days, followed by a slight decline to 25 days and a slight increase to 35 days, the end of the study. (Cassar-FRC)

OBSERVATION ON THE OCCURRENCE OF MICROBIAL AGENTS WHICH CAUSE LYSIS OF BLUE-GREEN ALGAE IN LAKE KASUMIGAURA,

Y. Yamamoto.
Japanese Journal of Limnology, Vol 42, No 1, p 20-27, 1981. 7 Fig, 5 Tab, 28 Ref.

Descriptors: *Microbial degradation, *Algal growth, Eutrophication, Lakes, Bacteria, Microorganisms, Toxicity, Seasonal variation, Distribution patterns, Vertical distribution, *Lake Kasumigaura, *Japan.

Attempts were made to determine the seasonal distribution of microbial agents which cause lysis of blue-green algae in Lake Kasumigaura and to ascertain whether these agents have a major role in the decline of algal blooms. The lake is euphotic; Microcystis are the dominant phytoplankton from June to September. The lake is about 168 square km in surface area with a maximum depth of 7.5 meters and average depth of 4 meters. Samples were taken from four sites at monthly intervals from August 1975 through October 1977. Water pH ranged from 6.8 in the winter to 9.6 in summer and fall. Water temperatures showed seasonal variation, with the lowest at 3.8 degrees C in winter and the highest at 29.2 degrees C in summer. The horizontal distribution patterns of plaques showed increases from July to October 1976 and decreased in February 1977, with high concentrations of chlorophyll a generally preceding the peaks of agents and the occurrence of algal-lysis agents being closely correlated with chlorophyll a contents. Many of the plaques were caused by amebas, bacteria and fungi. It was suggested that perhaps amebas are always present in association with some algae which are preferentially ingested, begin to grow rapidly in such an algal bloom as to increase the chance of feeding, attain to maximum population, and subsequently survive, possibly in cyst-like form, under unfavorable conditions. It is not clear from this study whether there is any significant relationship between the amebal population and the occurrence of bacteria or levels of gram-negative bacteria. (Baker-FRC)

Hydrobiologia, Vol 68, No 1, p 17-34, January, 1980. 10 Fig, 4 Tab, 21 Ref.

Descriptors: *Zooplankton, *Primary productivity, Lakes, Phytoplankton, *Lake Pavin, *France, Copepods, Cladocerans, Daphnia, Ceriodaphnia, Model studies, Productivity, Limnology, Water quality, Nutrients.

Zooplankton were collected bimonthly from May 1973 to April 1974 at six depths from 0 to 20 meters in Lake Pavin, located in the French Massif Central. The volcanic-origin lake is meromictic, 44 hectares in area, and 98 meters deep. The species studied were: Daphnia longispina, Ceriodaphnia quadrangula, Acanthodiaptomus denticornis, and Cyclops abyssorum. Copepods were present all year, with 2 principal reproduction periods, March-April and October-November. Nauplius larvae of A. denticornus died in winter. A mathematical model illustrated the relationships between phytoplankton and zooplankton and the biophysico-chemical parameters of the lake. The highest values of phytoplankton primary production and of the activity coefficient were found when herbivorous zooplankton development was significant and nutrient concentrations were at their minimum. (Cassar-FRC)

RELATIONSHIP BETWEEN CHLOROPHYLL-A CONCENTRATION AND PHYTOPLANKTON BIOMASS IN SEVERAL RESERVOIRS IN CZECHOSLOVAKIA,

Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
B. Desortova.
Internationale Revue der Gesamten Hydrobiologie, Vol 66, No 2, p 153-169, 1981. 10 Fig, 4 Tab, 30 Ref.

Descriptors: *Reservoirs, *Biomass, *Chlorophyll a, Nutrients, Light intensity, *Phytoplankton, Plankton.

The results of parallel determinations of phytoplankton biomass and chlorophyll concentration, the relations between these two parameters, and the effect of several factors such as species composition, light, and nutrients on the chlorophyll content in algal biomass are reported. The data were obtained during several years at five continuously studied reservoirs: the Slapy, Hubenov, Vrchlice, Klicava and Orlik. The relationship between phytoplankton biomass and chlorophyll concentration determined on the basis of results obtained from several reservoirs was in all cases positive. The statistical significance of the relationship was usually high, even though there was considerable variability within the mentioned relationship. This was mainly due to the fact that the changes in chlorophyll concentration did not always take place in parallel with the changes in total phytoplankton biomass. The chlorophyll content per unit biomass varied by more than two orders in the same locality in the course of the year. A negative relationship was noted between the phytoplankton biomass and the percentage chlorophyll content. Its closeness was affected by the great variations in chlorophyll content per unit biomass during the year. The percentage chlorophyll content in algal biomass was evidently affected by incident light. No significant effects from the species composition of algae or from nutrient concentration on the chlorophyll content per unit phytoplankton biomass have become evident thus far. (Baker-FRC)

LIMNOLOGICAL STUDIES OF A FRESHWATER FISH POND AT BURDWAN, WEST BENGAL, INDIA,

ICAR Research Complex, Shillong (India).
B. K. Mandal.
Japanese Journal of Limnology, Vol 41, No 1, p 10-18, January, 1980. 3 Tab, 22 Ref.

Descriptors: *Limnology, *Ponds, *Lakes, Fish, Plankton, Phytoplankton, Zooplankton, Rotifers, Crustaceans, Biomass, Aquatic life, Population dynamics, Seasonal variation, Algal blooms, *India.

The seasonal variations of the physico-chemical factors and plankton community of a freshwater fish pond were studied at Burdwan, West Bengal, India, during January to December of 1971. The pond is rectangular in shape, with an area of 4.2 ha. Its seasonal average depth varies from 3.5 meters during the rainy season to 2.0 meters during the dry season. Pond water is transparent for most of the year except the winter months, when a dense growth of Eichornia crassipes SOLMS and Potamogeton nodosus appears. The seasonal variation of pH value ranged from 6.5 to 8.3, with the peak in April and the low point in August. Dissolved oxygen varied from 5.5 to 17.5 mg/liter, high in December and low in May. Free carbon dioxide ranged from 1.5 to 12.0 mg/liter. Chloride content ranged from 80.0 to 180.0 mg/liter, peaking in March. Nitrate content ranged from 0.45 to 1.2 mg/l nitrate-nitrogen, peaking in July. Phosphate ranged from 0.25 to 0.95 mg/liter, peaking in July. Total plankton ranged from 8.7 to 14.2 ml, with a bimodal pattern of seasonal change. Peaks were recorded in February and July. Zooplankton occupied 21.8 to 82.6% of the total plankton volume, with rotifers and crustaceans being the dominant forms. The phytoplankton population in the total plankton varied from 17.4 to 78.2% and was composed of Chlorophyceae, Myxophyceae and Bacillariophyceae. Water blooms lasting until autumn were developed after the monsoon months. The components of the bloom were Microcystis and Anacystis in association with Anabaena. Diatoms were represented by 10 species only and were abundant during the monsoon season. Synedra ulna and Melosira granulata constituted the bulk of the diatom population and were present throughout the year. (Baker-FRC)

EXPLOITING PAPYRUS,

King's Coll., London (England). Dept. of Plant Sciences.
P. D. Moore.
Nature (London), Vol 284, No 5756, p 510, April 10, 1980.

Descriptors: *Eutrophication, *Aquatic weeds, Swamps, Papyrus, Nutrient removal, Performance evaluation, Nutrients, *Aquatic plants, Weeds, Nitrogen, Magnesium, Potassium, Phosphorus, *Lakes, Tropical lakes.

Papyrus forms floating swamps in the peripheral zones of tropical lakes which may be effective in absorbing nutrients from lakes in danger of eutrophication. The plant, which is robust and productive, absorbs considerable quantities of nutrient ions during swamp growth. Nutrient losses from death, decay, and leaching of older plants are believed to amount to about 65 percent of the material absorbed. The swamp acts as an effective extractor of nutrients, but much of the extracted material is transported as detritus by the flow-through below the mat. Nutrient absorption is also less when water movement is rapid. There is a high degree of nitrogen fixation within the swamp system. Periodic harvesting and removal of the biomass would increase the efficiency of papyrus swamps as nutrient extractors. Since the most rapid accumulation of nutrients occurs in the early growth stages, frequent cropping of the papyrus should result in a maximum nutrient drain on the lake system. In addition, the harvested papyrus can be used as a fuel. It is recommended that tropical swamps be conserved until their usefulness has been assessed and appropriate management regimes developed. THE COMPOSITION AND ECOLOGY OF PERIPHYTON COMMUNITIES IN FRESHWATERS. II. INTER-RELATIONSHIPS BETWEEN WATER CHEMISTRY, PHYTOPLANKTON POPULATIONS AND PERIPHYTON POPULATIONS IN A SHALLOW LAKE AND ASSOCIATED EXPERIMENTAL RESERVOIRS ('LUND TUBES'),

University of East Anglia Univ., Norwich (England). School of Environmental Sciences.
B. Moss.
British Phycological Journal, Vol 16, No 1, p 59-76, March, 1981. 9 Fig, 30 Ref.

Descriptors: *Phytoplankton, *Population dynamics, *Water chemistry, Nitrogen, Aquatic populations, Diatoms, *Lakes, Eutrophic lakes, *Algae, Seasonal variation, Phosphorus, Plankton.

Previous studies of eutrophication have shown that shading by increasing populations of periphyton algae may reduce macrophyte vigor prior to shading by increasing phytoplankton populations, which proliferate later in the process, resulting in the elimination of submerged macrophytes. Seasonal changes in the populations of both periphyton algae and phytoplankton were examined both in two experimental 20 meter diameter 'Lund tubes' placed in the Hickling Broad and in the Broad itself. Agriculture land drainage and roosting gull populations have contributed to the increasing eutrophication of the lake. Gulls perching on the rims of the Lund tubes have caused these reservoirs to experience even greater eutrophication. The water in the tubes experienced persistent domination by colonial blue-green algae, absence of a spring diatom pulse, severe nitrogen limitation, and scanty periphyton on Potamogeton pectinatus. Phytoplankton chlorophyll a levels were lower in the lake than in the tubes, but an alteration of spring diatom amnd summer colonial blue-green algae was found in the lake. The lake also showed less severe nitrogen limitation than the tubes, and abundant periphyton crops, especially of diatoms, developed on P. pectinatus and other macrophytes. Periphyton development in the tubes and in the lake was related to nigrogen availability in these phosphorus-enriched waters. The absence of seasonal variations in the phytoplankton population in the tubes was related to the absence of flushing of the water body in the autumn and winter. (Carroll-FRC)

STUDIES OF THE HYDROBIOLOGY OF A TROPICAL LAKE IN NORTHWESTERN QUEENSLAND. II. SEASONAL CHANGES IN THERMAL AND DISSOLVED OXYGEN CHARACTERISTICS,

James Cook Univ. of North Queensland, Townsville (Australia). Dept. of Botany.
C. M. Finlayson, T. P. Farrell, and D. J. Griffiths.
Australian Journal of Marine and Freshwater Research, Vol 31, No 5, p 579-569, October, 1980. 5 Fig, 11 Ref.

Descriptors: *Tropical regions, *Lakes, *Australia, New South Wales, Lake Moondarra, Stratification, *Thermal stratification, Seasonal variations, *Dissolved oxygen, Rainstorms, Precipitation, Hydrobiology.

Seasonal changes in vertical distribution of heat and oxygen in lake waters of Lake Moondarra were revealed by a sampling program extending from April 1976 to August 1978. The lake is man-made and located in northwestern Queensland. Evidence suggests that the lake approximates the warm polymictic type in which no persistent thermal stratification ever develops. During the cooler months, thermal stratification breaks down during the night. In the warmer months, the intense rainstorms prevent the establishment of a persistently stratified water column. The shallowness of the lake relative to its surface area and the prevailing environmental conditions ensure that extensive periods of oxygen depletion do not develop in the water column. A strong, prolonged period of thermal stratification would develop, with subsequent serious effects on the availability of dissolved oxygen in the deeper layers, only in the case in which there were no significant rainstorms within a given year's time. The stratification characteristics of Lake Moondarra set it apart from most Australian lakes, which belong to the warm monomictic type, with complete mixing occurring only in winter. The difference can be attributed to those features of the lake and of the local climatic conditions which prevent the establishment of a stable thermal stratification in the summer months. LIMNOLOGIC STUDY OF LAKE PAVIN (FRANCE) 1: ABIOTIC FACTORS AND PHYTOPLANKTON (CONTRIBUTION A L'ETUDE LIMNOLOGIQUE DU LAC PAVIN (FRANCE) 1: FACTEURS ABIOTIQUES ET PHYTOPLANCTON),

Biological Station, Besse-en-Chandesse (France).
J. Deveaux.
Hydrobiologia, Vol 68, No 2, p 167-189, January, 1980. 17 Fig, 5 Tab, 72 Ref.

Descriptors: *Lakes, *Phytoplankton, Temperature effects, Acidity, Mathematical models, Model studies, Carbon, Nitrogen, Oxygen, Physicochemical properties, *Lake Pavin, *France.

A synthetic mathematical model has been devised to summarize the physico-chemical parameters and phytoplankton relationships in Lake Pavin. The Lake itself is located at 1197 meters in the Massif Central Francais. The lake is a dimictic and meromictic lake of 44 ha in area and 92 meters depth. Bimonthly samples were taken at 8 depths ranging from surface to 40 meters. Sampling was performed between May 1973 and April 1974. The following physicochemical parameters were examined: light energy, temperature, pH, conductivity, available oxygen, nitrogen, phosphorus, silica, and carbon. Dynamics of the phytoplankton populations were also considered, such as cell counts, standing crop, primary production, and photosynthetic pigments. Lake waters are clear, with low conductivity and high concentrations of oxygen in the first 40 meters. The means of nitrogen concentration were between 45 and 279 microg/liter and between 0 and 161 microg/liter for phosphorus in a water column ranging from 0 to 40 meters. In winter and spring the phytoplankton are characterized by the development of Diatoms such as Melosira italica subsp. subarctica and Asterionella formosa, as opposed to low standing crops of Chlorophycea such as Coenococcus, Sphaerocystis, and Chlamydomonas which appear in summer. Photosynthetic activity is maximum during winter for diatom populations. (Baker-FRC)

PHYSICAL VARIABILITY AND PHYTOPLANKTON COMMUNITIES IV. TEMPORAL CHANGES IN THE PHYTOPLANKTON COMMUNITY OF A PHYSICALLY VARIABLE LAKE,

McMaster Univ., Hamilton (Ontario). Dept. of Biology.
G. P. Harris, and B. B. Piccinin.
Archiv fur Hydrobiologie, Vol 89, No 4, p 447-473, August, 1980. 11 Fig, 1 Tab, 23 Ref.

Descriptors: *Phytoplankton, *Species composition, *Temporal distribution, *Lakes, Seasonal variation, Algae, Diatoms, Chlorophyta, *Hamilton Harbor, *Lake Ontario, Environmental effects, Euphotic zone, Thermocline, Mixing, Lake circulation, Water circulation, Turbulent flow.

Phytoplankton communities were investigated weekly in Hamilton Harbor, Lake Ontario, during the ice free periods of 1975, 1976, and 1977. The

principal component analysis ordination method proved comparable to the non-metric scaling technique for analysis. The phytoplankton species distribution displayed a broad seasonal pattern each year, varying with the seasonal thermocline. Mixing depth and physical environment affected the precise timing of seasonal succession of species. The week by week plot ordinations showing changes in species assemblages over time indicated periods of stability and periods of change. The changes in species composition were not as rapid as environmental changes, showing an averaging effect. However, these changes were a more sensitive indicator of environmental changes than the absence or presence of a species because the reaction to physical perturbations was not complete until 1-4 weeks afterwards. A critical ratio of euphotic zone depth:mixing zone depth of 0.35 was identified. Below this value diatom growth was favored and green algae performance reduced. On the other hand, abundant green algae were associated with ratios of 0.2 to 1.0. A threshold of 8-9 meters mixing depth was noted in many cases. (Cassar-FRC)

IMPACT OF NUTRIENT ENRICHMENT IN A WATERCHESTNUT ECOSYSTEM AT TAKAHAMA-IRI BAY OF LAKE KASUMIGAURA, JAPAN. V. DYNAMICS OF ORGANIC DEBRIS,

Meikei High School, Ibaraki (Japan).
H. Nakono, and H. Seki.
Water, Air and Soil Pollution, Vol 15, No 2, p 215-227, 1981. 10 Fig, 1 Tab, 13 Ref.

Descriptors: *Eutrophication, *Lakes, *Bacteria, *Organic matter, Phytoplankton, Nutrients, Cyanophyta, Water pollution effects, *Lake Kasumigaura, *Japan, Detritus, Decomposing organic matter, Nitrogen compounds, Ecosystems.

Organic debris in the hypereutrophied Lake Kasumigaura, Japan, waterchestnut ecosystem showed dynamic fluctuations throughout the year. Profiles of particulate and dissolved organic matter were similar--high concentrations in summer and low in winter. Particulate organic matter, primarily detritus formed from phytoplankton and heterotrophic microorganisms, was present in 2 to 40 times greater concentrations than dissolved organic carbon. Dissolved organic carbon was dependent on excretion of extracellular products by living phytoplankton and by decomposition of phytoplankton. This material was utilized by heterotrophs, such as procaryotic bacteria. Turnover rate of dissolved organic matter, the time required for organic matter to be entirely removed by heterotrophs, was 52 days during blue-green algal bloom in summer, 61 days after the summer bloom in autumn, 101 days during the eucaryotic phytoplankton bloom in spring, and 188 days after the spring bloom in early summer. This is very rapid compared with a few thousand years in the deep oceanic region. Dissolved organic carbon concentration was 100 micrograms per liter at the end of autumn when heterotrophic activity was greatest. In this lake the relative distribution of total organic matter was as follows: during blue-green algal bloom--organic solute 100, detritus particle 200, phytoplankton 2,000, bacteria 40; during non-bloom period--organic solute 100, detritus particle 100, phytoplankton 400, bacteria 60. For comparison, the distribution of oligotrophic ocean water is: organic solute 100, detritus particle 10, phytoplankton 2, and bacteria 0.2 (Cassar-FRC)

THE PHOSPHORUS CYCLE IN GERMINSTON LAKE. 1. INVESTIGATIONAL OBJECTIVES AND ASPECTS OF THE LIMNOLOGY OF THE LAKE,

Rand Afrikaans Univ., Johannesburg (South Africa). Research Group for Freshwater Biology.
J. F. Vermaak, J. H. Swanepoel, and H. J. Schoonbee.
Water SA, Vol 7, No 3, p 160-165, July, 1981. 3 Fig, 3 Tab, 29 Ref.

Descriptors: *Phosphorus, *Limnology, *Lake restoration, Mine drainage, Hydrogen ion concentration, Alkalinity, Aquatic plants, Sago pondweeds, Germiston Lake, *South Africa, Cycling nutrients.

The fate of P32 in a freshwater lake, Lake Germinston, invaded by the submerged macrophyte P. pectinatus, was investigated as part of a study on the limnology of the lake and aspects of the history of its recovery from severe mine pollution. The lake has a catchment area of 1174 ha and a maximum water capacity of 2839 x 10 to the 6th power cu m. It is in a highly industrialized area and receives mineralized seepage water from a gold mine. Industrial inputs to the lake were stopped; its water was alkalinized, and the pH buffered. In this study, the water in the lake was analyzed and the biomass of Potamogeton was determined. Excessive growth of water weeds developed during the lake's recovery from pollution. P. pectinatus biomass reached peaks during the summer, autumn, winter, and spring respectively in the order: 1:2:4:8. Phosphorus contents of the plant tissue for the same periods were related as 1:1:2:1.4. P. pectinatus may be playing a controlling role in the lake ecosystem with respect to the phosphorus cycle. Journal of Phycology, Vol 16, No 4, p 568-577, 1980. 10 Fig, 3 Tab, 45 Ref.

Descriptors: *Phytoplankton, *Photosynthesis, *Lake Taupo, *New Zealand, Nutrients, Light intensity, Chlorophyll, Fluorescence, Ecology, Lake District, England, Lake Rotorua.

The study examines the time-response of photosynthetic capacity and fluorescence characteristics of three dissimilar phytoplankton communities exposed to changing light or nutrient levels. Diel variation in photochemical capacity under natural and controlled conditions was measured by DCMU-induced fluorescence in oligotrophic Lake Taupo, New Zealand. The effects of Langmuir circulation on photosynthesis were examined in an oligotrophic water body in the English Lake District. Finally, the extent of photosynthetic and fluorescence response to increased nutrient availability and the probable effect of such photosynthetic regulation for growth were assessed with several bioassays on Lake Rotorua, a eutrophic water body with pronounced nitrogen limitation. The results from the three separate plankton communities demonstrated that photochemical capacity may vary markedly both over the 24 hr cycle and in response to changing light and nutrient conditions. Taupo plankton incubated under a controlled light/dark cycle demonstrated a much greater variation in cellular fluorescence capacity than could be explained by the circadian rhythm detected in low light cells. The pattern and amplitude of circadian rhythms of cellular fluorescence capacity appear to be highly dependent on species composition. These variations may in part reflect rapid tuning of electron transport capacity to changed environmental conditions. (Baker-FRC)

THE EFFECT OF SUSPENDED MATERIALS ON THE ZOOPLANKTON, I. NATURAL ENVIRONMENTS,

Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
R. Zurek.
Acta Hydrobiologica, Vol 22, No 4, p 449-471, 1980. 2 Tab, 55 Ref.

Descriptors: *Turbidity, *Suspended solids, *Zooplankton, Ponds, Reservoirs, Phytoplankton, Toxicity, Water quality.

The significance of suspension upon zooplankton populations was investigated in a pond and two reservoirs. Water samples were analyzed for heterotrophic bacteria, turbidity, oxygen, chlorophyll alpha, organic matter and mineral composition. The pond contained a great deal of phytoplankton with a maximum turbidity of 1200 mg SiO2/cu dm or 123 mg of mineral fixed residue. The suspension was significantly noxious for Kerarstella cochlearis, K. quadrata, Trichocerca cylindrica, Ceriodaphnia pulchella, Daphnia pulex and Chaoborus/crystallinus. Seston from the lowland reservoir had a maximum turbidity of 119.5 mg SiO2/cu dm. It had a significant negative effect on Daphnia cuculata, cladocerans and copepods. However, it stimulated the development of rotifers. The upland reservoir had a turbidity of over 300 mg SiO2/cu dm, and zooplankton was practically absent. There was a negative relationship with turbidity for all species. (Small-FRC)

CONTRIBUTION TO HIGH ALTITUDE LIMNOLOGY OF THE HIMALAYAN SYSTEM I. LIMNOLOGY AND PRIMARY PRODUCTIVITY OF THE PLANKTON COMMUNITY OF NILNAG LAKE, KASHMIR,

Kashmir Univ., Srinagar (India). Dept. of Botany.
M. A. Khan, and D. P. Zutshi.
Hydrobiologia, Vol 75, No 2, p 103-112, October, 1980. 7 Fig, 3 Tab, 25 Ref.

Descriptors: *Lake classification, *Water quality, *Mountain lakes, *Nilnag Lake, *Kashmir, India, *Himalaya Mountains, Eutrophication, Nutrients, Phytoplankton, Zooplankton, Aquatic plants, Mesotrophic lakes, Dimictic lakes, Primary productivity, Light penetration, Secchi disks.

Dimictic Nilnag Lake (altitude 2180 meters, area 6.3 ha) in the Kashmir Himalayas at 33 degrees 52 min N and 74 degrees 42 min E was studied during 1974-76. Secchi transparencies ranged from 1 meter in November 1974 to 2.3 meters in April 1976. Vertical extinction coefficients were 0.73-1.7. The pH varied from 7.8 to 8.4, with little difference between surface and bottom waters. Dissolved oxygen levels of surface water varied from 5.1 mg per liter in summer to 10 mg per liter in autumn. Ca(2+) was the dominant cation and bicarbonate, the dominant anion. Specific conductivity ranged between 232 and 370 micro s at 25 C; total alkalinity, 147-220 mg per liter as CaCO3; nitrates, 19.0-30.5 micrograms per liter; and phosphates, 6.0-12.5 micrograms per liter. Annual production of the lake was estimated at 90-100 g carbon per sq meter. Macrophyte life was rich and varied. Most abundant phytoplankton were Cyanophyceae, Chlorophyceae, Bacillariophyceae and Chrysophyceae. Rotifers, cladocerans, and copepods were the most abundant zooplankton. This lake, classified as mesotrophic, shows the effects of human activity in the catchment. (Cassar-FRC)

IRON-MANGANESE BANDING IN ONEIDA LAKE FERROMANGANESE NODULES,

South Carolina Univ., Columbia. Dept. of Geology.
W. S. Moore.
Nature (London), Vol 292, No 5820, p 233-235, July 16, 1981. 2 Tab, 10 Ref.

Descriptors: *Lake sediments, *Iron, *Manganese, *Oneida Lake, New York, *Chemical composition, Oxides, Iron compounds, Metals, Ferromanganese nodules, Oxygen depletion.

Ferromanganese nodules in the oceans and in freshwater lakes usuelly develop layers rich in manganese oxides alternating with layers rich in iron oxides. The process producing this layering pattern is unknown, as is the process producing the nodules. Field studies and laboratory experiments were conducted to investigate these phenomena in Oneida Lake, a freshwater lake near Syracuse, New York. Both freshly precipitated ferromangan-

ese deposits and the surfaces of nodules exposed to the lake water are rich in manganese. Nodules buried in lake sediments have surface layers enriched in iron. Laboratory experiments demonstrated that burying a nodule in lake sediments for several months results in the formation of a skin rich in iron and depleted in manganese. Manganese oxide on the nodule surface appears to accept electrons from carbon oxidation in the sediments, mobilizing manganese ions. This reduction and mobilization of manganese from the nodule surfaces during periods of anoxic sediment cover seems to produce the high iron layers observed in the nodules. (Carroll-FRC)

ACIDIFICATION IN 50 NORWEGIAN LAKES,

Oslo Univ. (Norway).
J. Okland.
Nordic Hydrology, Vol 11, No 4, p 25-32, 1980. 5 Fig, 1 Tab, 13 Ref.

Descriptors: *Acid water, *Norway, *Water analysis, *Lakes, Hydrogen ion concentration, Hardness, Acid rain, Air pollution, Fallout.

Since the 1950's significant acidification has taken place in southeastern Norway lakes. There were two observation periods, 1953-57 and 1963-70. For the 50 lakes studied, the average pH dropped from 7.0 to 6.8, a statistically significant change; total hardness showed no significant change. In the low total hardness group (less than or equal to 1 degree dH) average pH changed from 6.6 to 6.3 and average H+ concentration increased by 4.33 times 10 to the minus 7th power mol per liter, equivalent to a 233% change. For the high total hardness lakes (greater than 1 degree dH) there was no statistically significant change in acidity. Lakes with low total hardness appear vulnerable to acidification. Such lakes are located all over Norway and predominate in some areas. (Cassar-FRC)

21. Water In Plants

WATER USE EFFICIENCY IN DOUGLAS FIR: THE NATURE OF PLANT RESPONSE TO SELECTED ENVIRONMENTAL VARIABLES,

Washington Univ., Seattle. Dept. of Botany.
F. C. Meinzer.
PhD Dissertation, 1981. 173 p, 27 Fig, 3 TAb, 4 Plates, 113 Ref, 3 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-13464.

Descriptors: *Water use efficiency, *Irradiation, *Trees, Vapor pressure, Stomatol transpiration, Adaptation, Environment, *Douglas fir, *Pacific Northwest, Stomatal behavior.

Potted, four-year-old, 80 to 100 cm tall Douglas fir plants were used to assess the effects of changes in irradiance and ambient vapor pressure on stomatal behavior and gas exchange. The role of the observed stomatal responses in the regulation of efficiency of water use, and the physiological bases of the responses were examined. Observed plant performance in relation to changing environmental variables was used as an empirical estimate of the relative importance of regulation of water use efficiency as a component of adaptive stomatal behavior for Douglas fir. Stomatal responsiveness of Douglas fir to light and humidity was observed to vary according to the season of the year and degree of maturity of the foliage. The observed patterns of stomatal behavior and gas exchange are discussed in the context of ecologically adaptive behavior under the prevailing climatic regimes west of the Cascade Mountains in the Pacific Northwest. MODELS OF WATER TRANSPORT IN THE SOIL-PLANT SYSTEM: A REVIEW,

Auburn Univ., AL. School of Engineering.
F. J. Molz.
Water Resources Research, Vol 17, No 5, p 1245-1260, October, 1981. 11 Fig, 127 Ref.

Descriptors: *Model studies, *Soil-water-plant relationships, Water transport, Plant water potential, Soil moisture, Reviews.

Information is presented on water movement in plant and soil-plant systems. Emphasis is placed on water movement in soil containing roots and on a general approach to water transport in living plant tissue. Detailed quantitative studies of water extraction by plant roots date back to studies by Gardner published in 1960. Many contemporary models have been built around extraction functions in the Darcy-Richards equation. Several such functions are listed, along with their applications, relative advantages, and limitations. In a series of papers appearing in 1958 the first detailed quantitative description of water transport in plant tissue was published. The approach developed then resulted in a diffusion equation, which could be written with water potential as the dependent variable. The derivation assumed that water movement was primarily from vacuole to vacuole. Subsequent workers have refined and extended the development to include water movement in cell walls and plasmodesmata. The development, interpretation, and application of these models over the past decade is presented. It can be stated that contemporary models of water transport in plant tissue are oversimplified. However, they have been subjected to some successful testing and they provide a framework within which to devise experiments. Moreover, the recent development of sophisticated experimental techniques should result in more detailed model testing during the 1980's. (Baker-FRC)

STRUCTURE AND FUNCTION OF MYCORRHIZAL RHIZOMORPHS WITH SPECIAL REFERENCE TO THEIR ROLE IN WATER TRANSPORT,

Sheffield Univ. (England). Dept. of Botany.
J. A. Duddridge, A. Malibari, and D. J. Read.
Nature, Vol 287, No 5785, p 834-836, October, 1980. 2 Fig, 1 Tab, 14 Ref.

Descriptors: *Rhizosphere, *Water transport, *Plant physiology, *Soil-water-plant relationships, Absorption, Plant water potential, Soil water, Forests, Root zone, Pine trees, Trees, Arid climates.

The potential of mycorrhizal rhizomorphs to absorb and transport water was examined in laboratory tests. Mycorrhiza cultures were synthesized under aseptic conditions and inoculated with Suillus bovinus fungus. Three seedlings were transferred to peat and exposed to tritiated water supplies. Rhizomorphs emerging from the cup were sliced into sections from top to root. Scintillation counting of each section revealed that the water had moved from both the upper and lower source cups through rhizomorphs to mycorrhizal roots and shoots in just 1 hour. Water movement was dependent on the presence of a rhizomorph connection from source cup to seedling. Ultrastructural analysis showed great differentiation in this type of rhizomorph. Their diameters were between 6 and 20 micrometers and resembled the xylem vessels of higher plants. These rhizomorphs may absorb water and facilitate its transport over ecologically significant distances. Investigations are being conducted to select mycorrhizal associates which are capable of improving the performance of forest crops, especially in semiarid regions. (Geiger-FRC)

CEREAL YIELDS AND DROUGHT RESISTANCE,

Agricultural Research Council, Trumpington (England). Plant Breeding Inst.
S. A. Quarrie.
Nature (London), Vol 285, No 5767, p 612-612, June 26, 1980.

Descriptors: *Cereal crops, *Drought resistance, *Crop yield, *Great Britain, Water use efficiency, Plant growth, Plant morphology.

Cereal yields in the United Kingdom have been increasing for the past 30 years and are now 80 percent higher than they were in 1950. Studies of the effectiveness of breeders in improving cereal yields have shown that the best of the new varieties of winter wheat consistently provided yields about 40 percent higher than those of old varieties, dating back to 1908. The new varieties, which are much shorter than the older varieties, have experienced reductions in stem weight which have been exactly balanced by increases in grain weight. However, since there is a limit to how far stem weights can be reduced with matching increases in grain yield, varieties capable of giving a greater biomass yield must be developed if the trend of increasing yields is to be continued. Since an increase in biomass yield would probably require increased water use, emphasis must be placed on more efficient use of available rainfall and stored water. Several studies have suggested strategies for improving the drought resistance of new varieties through breeding. Studies have investigated the effects of stomatal frequency on transpiration in related lines of barley, the genetic variability in the length and number of wheat roots, the biochemistry of water stress, and the effect of the plant hormone abscisic acid on drought resistance. Although many physiological and morphological characters are significant for water use efficiency, the useful variation for a given character within a cereal species may be limited. (Carroll-FRC)

POSSIBLE ROLE OF ABSCISIC ACID IN REDUCING SEED SET IN WATER-STRESSED WHEAT PLANT,

New South Wales Dept. of Agriculture, Tamworth. Tamworth Agricultural Research Center.
J. M. Morgan.
Nature (London), Vol 285, No 5767, p 655-657, June 26, 1980. 1 Fig, 2 Tab, 11 Ref.

Descriptors: *Seeds, *Crop yield, *Wheat, Soil-water-plant relationships, Water stress, Plant growth, Plant morphology, Leaves, Water deficit, Turgidity, *Abscisic acid.

A reduction in the number of seeds set per spikelet as a result of an increase in male sterility is one of the major effects of water stress on grain yield in wheat. Little is known about the relationship between the loss of pollen viability and the water relations of the developing spikelets, so the mechanisms of this effect of water deficits are not known. The relationship between leaf turgor and seed set was investigated in wheat plants. These studies indicated that seed set may be reduced by water deficits which cause leaf wilting but have no effect on spikelet turgor or relative water content, suggesting that abscisic acid may be involved in the processes causing floret infertility. Abscisic acid content is known to increase substantially when leaves wilt and to modify developmental processes in plants. Laboratory experiments showed that reductions in the seed set due to water stress were accompanied by increases in endogenous abscisic acid in both leaf and spikelet and that foliar application of synthetic abscisic acid at the stage of meiosis also reduced seed set and caused malformation of pollen grains and anthers. The data did not provide sufficient information to determine the precise stage of microsporogenesis at which the abscisic acid acts. However, the results do inicate that mechanisms which maintain leaf turgor during periods of declining water potential are important in reducing yield losses in crop plants growing in semi-arid areas. RESPONSE OF SORGHUM TO MOISTURE STRESS USING LINE SOURCE SPRINKLER IRRIGATION I. PLANT-WATER RELATIONS,

International Crops Research Inst. for the Semi-Arid Tropics, Patancheru (India).
M. V. K. Sivakumar, N. Seetharama, K. S. Gill, and R. C. Sachan.
Agricultural Water Management, Vol 3, No 4, p 279-289, 1981. 9 Fig, 1 Tab, 8 Ref.

Descriptors: *Sprinkler irrigation, *Soil-water-plant relationships, *Sorghum, *Moisture stress, Water stress, Irrigation, Soil moisture, Stomatal transpiration, Leaves, Water potentials, Plant water potential, *India, Semiarid lands.

A line source sprinkler irrigation system was useful in determining the response of sorghum (Sorghum bicolor L.) to different levels of moisture stress. Data on water use, stomatal conductance, leaf water potential, and leaf temperature showed that water stress varied as a function of the distance from the line source. Since sorghum, an important post-rainy season crop in India, depends on residual soil moisture, it was desirable to have varying levels of soil moisture for quantitative studies under field conditions. Cumulative water use, which increased throughout the season, was always higher in the first four beds closest to the line source, intermediate in beds 5-8, and lowest in beds 9-12. The maximum difference in water depletion (34 mm) occurred 65 days after planting. Both leaf conductance and mean daily leaf water potential decreased continuously throughout the season in all beds and were always highest in beds 1-4. Mean daily leaf temperature steadily increased until about 70 days after planting, then dropped sharply at 75 days and increased thereafter. (Cassar-FRC)

WHEAT YIELD ESTIMATION IN NORTHWEST IRAN,

International Inst. for Land Reclamation and Improvement, Wageningen (Netherlands).
P. J. Slabbers, and F. X. Dunin.
Agricultural Water Management, Vol 3, No 4, p 291-304, 1981. 5 Fig, 4 Tab, 9 Ref.

Descriptors: *Wheat, *Crop yield, *Soil moisture, Agriculture, Model studies, Simulation analysis, *Iran, Semiarid lands, Fallowing, Soil-water-plant relationships, Water management.

A two-stage model was developed to predict the wheat yield for different forms of crop management in an area near Tabriz, Iran, where subsistence farming is practiced. Simulation covered nine soil moisture regimes and two lvels of management (existing and improved). Model results agreed reasonably with the available information on water balance, streamflow, and wheat production. Predicted soil moisture storage before the November sowing varied between 14 mm for a shallow soil in a dry fallow year to 84 mm in a deep soil following a wet fallow year. Evapotranspiration is reported for the critical six week period starting in mid-May. The proportion of fallow storage used by crops decreases with increasing rainfall in the cropping year and with decreasing soil depth. Simulated wheat yields varied between 290 and 895 kg per ha. Improved management practices will produce the greatest yield increases in deeper soils (750 cm) over a wide range of precipitation conditions, especially when fallow is included in the rotation. This model can be applied to any semiarid region where agriculture is marginal. However, the benefits and negative aspects of long-established practices, in this case, the grazing of animals during the fallow season, must be weighed. Allowing animals to graze provides animal feed and weed control but depletes stored soil moisture. (Cassar-FRC)

PATTERNS OF WATER POTENTIAL AND PHOTOSYNTHESIS OF DESERT SAND DUNE PLANTS, EUREKA VALLEY, CALIFORNIA,

California Univ., Davis. Dept. of Botany.
B. M. Pavlik.
Oecologia, Vol 46, No 2, p 147-154, 1980. 8 Fig, 2 Tab, 29 Ref.

Descriptors: *Plant water potential, *Photosynthesis, *Desert plants, Sand, *Deserts, Water use efficiency, Ecology, *California.

Patterns of water status and photosynthetic productivity were examined in dune and non-dune desert habitats. Eureka dunes were chosen as a field site because the presence of two perennial endemics suggested a close relationship between the desert sand dune habitat and its restricted taxa. Plants were investigated for mode of photosynthesis (C3 or C4), daily and seasonal patterns of xylem water potential, seasonal patterns of field photosynthesis, and laboratory gas exchange characteristics. All plants surveyed except Swallenia alexandrae used C3 photosynthesis. Dune plants had significantly lower xylem water potentials, dampened seasonal changes in predawn water potentials, and smaller seasonal amplitudes of water potential than plants of the adjoining flats. Moisture conserving traits were observed in the endemic perennials, such as stomal closure at relatively high water potentials and high water use efficiency. Swallenia minimum water potentials during the summer months were a third of those endured by adjacent non-dune larrea. High photosynthetic productivity, high water use efficiency, and carbon allocation to the longitudinal growth of roots and shoots seemed to be important adaptations for plants in the shifting sand and substrate moisture depletion atmosphere of the dunes. SEMINAL ROOT MORPHOLOGY AND WATER USE OF WHEAT. I. ENVIRONMENTAL EFFECTS,

Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
R. A. Richards, and J. B. Passioura.
Crop Science, Vol 21, No 2, p 240-252, April, 1981. 3 Fig, 3 Tab, 7 Ref.

Descriptors: *Crop yield, *Moisture availability, Drought, *Wheat, Soil moisture, Resistance, Farming, Climatology, Water use efficiency, *Soil-water-plant relationship.

Possible influence of environmental conditions on the morphology of the seminal root system is investigated in wheat. When wheat was grown mainly on a limited supply of stored soil water, an increase was noted in the axial resistance to water flow in the roots, which served to conserve some of the water for the critical periods during flowering and grain filling. This increase in axial resistance to water flow is accomplished by either decreasing the diameter of the main xylem vessel in the seminal axes or decreasing the number of seminal axes. The effects of different environments, or seed characters which are influenced by the environment, on both these seminal root characters are reported. Few of the many factors studied exhibited an effect. The most notable were grain size, drought and temperature between germination and emergence, and drought when the seed was being produced. Neither root character showed any genotype/environment interactions when contrasting genotypes were grown in different environments. This gives promise that selection for increased resistance could be done under controlled conditions. (Baker-FRC)

CONSUMPTIVE WATER USE BY OPIUM POPPY,

Indian Agricultural Research Inst., New Delhi.
B. B. Turkhede, R. De, and R. K. Singh.
Indian Journal of Agricultural Sciences, Vol 51, No 2, p 102-107, February, 1981. 3 Tab, 5 Ref.

Descriptors: *Consumptive use, *Water use efficiency, *Crop yield, Irrigation effects, Water stress, Crop production, Agriculture, *Opium poppy.

An experiment was conducted for two consecutive years to determine the critical stages of water requirement for opium poppy, total consumptive use, water use efficiency, and seed yield and morphine content. Fourteen treatments were evaluated, of which 12 represented irrigation at different phenological stages of crop growth. The maximum opium yield and the lowest morphine content in opium were recorded in plots subjected to no stress at any stage of plant growth and receiving all seven irrigations. Morphine yield per hectare was generally higher when the plants were not subjected to prolonged water stress. Opium yield reduction occurred when irrigation was skipped during the rosette and flowering stages. Stress during the flowering stage seemed to encourage seed yield. The water use efficiency of the seven-irrigation treatment was rather low. Water use efficiency was highest when irrigation occurred at 50% ASM (22.2 g opium/cu m water). (Small-FRC)

PERFORMANCE OF DIFFERENT CROPS WITH RESIDUAL MOISTURE IN VERTISOLS,

Andhra Pradesh Agricultural Univ. Hyderabad (India).
T. C. Jain, and G. R. Reddy.
Indian Journal of Agricultural Sciences, Vol 51, No 3, p 181-184, March, 1981. 1 Fig, 3 Tab, 4 Ref.

Descriptors: *Crop production, *Soil water, *Water use efficiency, Moisture stress, Soil types, Crop yield, *India.

The capacity of black soils (vertisols) to store sufficient moisture in southern India to support crop production was evaluated in a field study in which different crops were grown in sequence or in relay. The crops depend upon stored soil moisture and on 27 mm of rainfall received during the experimental period. Twelve crops were grown in relay on September 28 and in sequence on October 12, following the rainy season. Pigeonpea was the most successful crop; studies at the time of harvest indicated that the roots of pigeonpea entered deep (107 cm) and could extract water from the deeper, wet layer of soil. Blackgram, cowpea, and greengram gave successful yields when they were sown in later September and early October. Wheat, chickpea, and coriander were recommended for sowing in late October or November only. In economic terms, pigeonpea gave the higest return, while coriander was second due to its high market price. (Small-FRC)

2J. Erosion and Sedimentation

COPING WITH INCREASED STREAM EROSION IN URBANIZING AREAS,

Rutgers-The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr., and J. DiLouie.
Water Resources Research, Vol 17, No 5, p 1561-1564, October, 1981. 2 Fig, 2 Tab, 7 Ref.

Descriptors: *Uran areas, *Stream erosion, Erosion, Channel erosion, Channel improvement, Model studies, Bed load, Sediment, Bed-load discharge, *Sediment transport, *Uranization.

The increasing channel degradation being experienced in many urbanizing area streams is discussed. Increased flooding caused by intensive land development is related to stream erosion through bed load transport theory. Analysis of these relationships leads to conclusions as to channel design criteria. Current design criteria for culverts crossing such streams should be modified. The modeling of potential bed load carrying capacity for urbanizing area streams by means of the Schoklitsch bed load formula and a standard runoff model shows results which corresponded to the widely observed stream erosion tendency in urban streams. When the models were applied to a partially developed watershed in Princeton Township, New Jersey, it was noted that the bed load carrying capacity at the peak of a 15 year flood has been greatly increased. It is apparent that the criteria for approving stream encroachments should discourage any action to increase channel velocity in areas where bed load capacity has been increased by processes of urbanization. Results regarding culverts suggest that the detention provided during floods by backwater in streams passing through small culverts has a significant flood retardation effect. The replacement of these culverts with those specified by usual design criteria would more than double the detention capacity needed to com-

pensate for future development in the two cases studied. Each culvert provided a significant reduction in stream velocity during floods and constituted an anchor limiting the progress upstream of channel scour. (Baker-FRC)

SEDIMENT REGULATION PROBLEMS IN SANMENXIA RESERVOIR,
Institute of Water Conservancy and Hydroelectric Power Research, Beijing (China).
L. Yuqian, and Z. Qishun.
Water Supply and Management, Vol 5, No 4/5, p 351-360, 1981. 5 Fig.

Descriptors: *Reservoirs, *Sedimentation, *China, *Yellow River, Rivers, *Sanmenxia Reservoir, Design criteria, Flood control, Runoff, Construction, Storage reservoirs, Multipurpose reservoirs.

The Sanmentia Reservoir is a multipurpose hydroproject mainly used for flood control, controlling a drainage area of 684,000 square kilometers, or 92% of the entire Yellow River Basin in China. Dam construction began in 1957 and the river was closed in November 1958. The concrete gravity dam was completed in September 1960, with a maximum height of 96 meters and a total length of 908 meters. There are 12 deep sluices at the 300 meter elevation and two spillways at 338 meters. After the reservoir began to function as a storage basin, serious defects were noted. Backwater deposits extended upstream with remarkable rapidity, endangering the industrial and agricultural activities in the vicinities of the reservoir, and, with the speedy depletion of the storage capacity of the reservoir, the security of the protection against floods in the Lower Yellow River could no longer be assured. Steps were taken to reconstruct the dam. The key problem of reservoir operation is to prolong the life of the reservoir for a long time so that multipurpose benefits may be developed as much as possible. To retain a usable storage capacity it is necessary that the upstream extension of the backwater deposits be controlled and that the aggradation in the downstream of the Yellow River be minimized. The reservoir must regulate not only the runoff but also the sediment. In the reservoir operation, due consideration must be given to the control of upstream extension of backwater deposits and to avoid the disadvantageous effects on the downstream reach of the Yellow River due to the detention of floods in the reservoir. MOLECULAR DIFFUSION AND THE SEDIMENTARY ENVIRONMENT: RESULTS FROM THE IN SITU DETERMINATION OF WHOLE SEDIMENT DIFFUSION COEFFICIENTS,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Oceanography.
P. E. Kepkay, R. C. Cooke, and A. J. Bowen.
Geochimica et Cosmochimica Acta, Vol 45, No 9, p 1401-1409, September, 1981. 8 Fig, 2 Tab, 16 Ref.

Descriptors: *Diffusion coefficient, *Sediments, Dialysis, *Sulfates, *Carbon dioxide, Microbiological studies, Porosity, Solute transport, Pore water, *Halifax Harbor, *Nova Scotia.

A dialysis technique which includes the effects of microbial action was developed for in situ determination of whole sediment diffusion coefficients. This apparatus was used to measure the diffusion of sulfate and total dissolved carbon dioxide (transported primarily as bicarbonate) in sediments of Halifax Harbor, Nova Scotia. Diffusion was related to the porosity of the sediment. Two zones of sediment porosity and diffusion rates were observed, 0-16 cm, and 60-120 cm. Diffusion of total dissolved CO2 was not affected by microbial activity, but transport of dissolved sulfate was significantly affected by microbial reduction of the sulfate pool available for diffusion. The whole sediment diffusion coefficient for dissolved sulfate at the 60 cm level was 16.6% greater in the sterilized core than in the unsterilized core and the in situ sediment. Sulfate could not be detected below the 60 cm horizon. (Cassar-FRC)

PALAEOECOLOGICAL STUDIES OF LAKES IN THE HIGHLANDS OF PAPUA NEW GUINEA. I. THE CHRONOLOGY OF SEDIMENTATION,
Liverpool Univ. (England). Dept. of Geography.
F. Oldfield, P. G. Appleby, and R. Thompson.
Journal of Ecology, Vol 68, No 2, p 457-477, July, 1980. 12 Fig, 3 Tab, 46 Ref.

Descriptors: *Lakes, *Agriculture, *Erosion, *Sedimentation, Papua New Guinea, Bottom sediments, Human population, Ecology, Environmental effects, Sweet potatoes, Crops.

Sediments from three small lakes in the highlands of Papua New Guinea were studied to determine the effects of man's activities on erosion. The volcanic ash bands common to all three lakes aided dating by various methods: sedimentary trace of geomagnetic secular variation, radiocarbon, Pb210, Cs137, and historical evidence. A chronology of 10,000 years of sedimentation was established. Evidence suggests little or no sedimentation occurred during the periods 10,000 to 5,000 and 4,000 to 1,600 years B.P. At Lake Pipiak, still forested at the time of the study in 1973, little variation in sedimentation has occurred in the distant or recent past. However, at Lakes Egari and Ipea, sites of extensive agriculture, mostly sweet potatoes, sedimentation started to increase 150-300 years ago and has increased more rapidly since 1950, when extensive Western contact began. AIChE Symposium Series, Vol 77, No 209, p 49-66, 1981. 10 Fig, 12 Tab, 14 Ref.

Descriptors: *Chemical reactions, *Water softening, *Chemistry of precipitation, *Scaling, *Hardness, Chemical properties, Water treatment, Wastewater treatment, Kinetics, Industrial water, Thermodynamics, Mathematical equations, Hydrogen ion concentration, Alkalinity.

Experimental studies are described which were performed to determine the precipitation kinetics of calcium carbonate and of the combined calcium carbonate-magnesium hydroxide system. A brief review of the water chemistry, steady state crystallization theory, and thermodynamic fundamentals involved is presented. The kinetics of calcium carbonate and magnesium hydroxide are a sensitive function of pH. The growth rate, nucleation rate, and kinetic order were measured for various alkalinity distributions caused by the addition of lime as the chemical treating agent. Both systems were scale depositing, usually existing in nonstoichiometric ratios of ions. The phase transformation of calcium carbonate from aragonite to calcite is discussed. The growth rate for the simultaneous precipitations of calcium carbonate and magnesium hydroxide was correlated with the residence time and the respective growth rates of the separate precipitations of calcium carbonate and magnesium hydroxide. BIOGEOCHEMICAL CYCLING IN AN ORGANIC-RICH COASTAL MARINE BASIN - I. METHANE SEDIMENT-WATER EXCHANGE PROCESSES,
North Carolina Univ. at Chapel Hill. Dept. of Geology.
C. S. Martens, and J. Van Klump.
Geochimica et Cosmochimica Acta, Vol 44, No 3, p 471-490, 1980. 12 Fig, 7 Tab, 60 Ref.

Descriptors: *Methane, *Sediment-water interfaces, Interfaces, Hydrocarbons, Sediments, Seawater, Bights, Bays, Sounds, Oxidation, *Organic compounds, Seasonal, *Chemical reactions, Bubbles, Coastal waters, *Cape Lookout Bight, North Carolina.

Samples of anoxic organic-rich sediments of Cape Lookout Bight, North Carolina, were secured by gravity coring. Water samples were also taken to establish depth-concentration profiles for dissolved chemical species at depths of 5, 7, and 8 m using Niskin bottles. Methane produced in the sediments was found to enter the water column in two seasonally dependent manners. During November-May and again between June-October the diffusive transport of methane in situ with benthic chambers averaged 49 and 163 micromol/square meter/hour, respectively. High summer sediment methane production caused saturation concentrations, and this resulted in the formation of bubbles near the sediment-water interface. Low-tide hydrostatic pressure release then triggers bubble ebullition. Bubbling maintains open bubble tubes, which apparently enhance diffusive transport. When tubes are present, apparent sediment diffusivities are 1.2-3.1 fold higher than theoretical molecular values. Dissolution of 15% of the rising bubble flux containing 86% methane supplies 170 micromol/square meter/hour or methane to the bight water column during the summer months. The remainder is lost to the troposphere. During bubbling the bottom water methane concentration increases can be predicted using a 5-15 micrometer stagnant boundary layer dissolution model. Advective transport to surrounding waters is the major dissolved methane sink. Aerobic oxidation and diffusive atmospheric evasion are minor within the bight. (Baker-FRC)

DIEL FLUX OF DISSOLVED CARBOHYDRATE IN A SALT MARSH AND A SIMULATED ESTUARINE ECOSYSTEM,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
C. M. Burney, K. M. Johnson, and J. M. Sieburth.
Marine Biology (Berlin), Vol 63, No 2, p 175-187, July, 1981. 6 Fig, 5 Tab, 57 Ref.

Descriptors: *Salt marshes, *Carbohydrates, Estuaries, Marshes, Tidal marshes, Saline water, Seawater, Estuarine environment, Coasts, Narragansett Bay, Ecosystems, Model studies, Diel flux.

The purpose of this study was to estimate net dissolved carbohydrates (CHO) release and uptake rates and to look for evidence of biological regulation of the CHO dynamics using measurements made at 2 or 3 hr intervals over diel cycles from a New England salt marsh and a 5 meter deep seawater tank designed to simulate the Narragansett Bay estuary. Results from each of the salt marsh studies showed evidence of highly signifi-

cant total CHO (TCHO) accumulation, primarily due to net polysaccharide (PCHO) release, commencing in the late morning or early afternoon and continuing through at least two sampling periods into the early evening. TCHO and PCHO usually reached their daily maxima at the end of this period. Maximum rates of PCHO accumulation in this time period occurred during or just after the period of maximum net system production indicated by the oxygen, acidity, and total carbon dioxide data. No period of PCHO accumulation was sustained over more than one sampling interval during a cloudy day in August. However, a very pronounced PCHO increase occurred on the following clear day, suggesting an association between the photosynthetic rate and PCHO release. PCHO release on the cloudy day was curtailed due to light limitation of photosynthesis. The mechanism connecting photosynthesis with PCHO release is not known. The monosaccharide cycles in the marsh show much smaller net fluctuations relative to PCHO. In the tank study, large PCHO and TCHO excursions were not shown as in the marsh study. There was also a lack of sustained afternoon PCHO increases which were characteristic of the marsh. The multi-parameter diel sampling of confined water masses can yield useful information on the interaction of ecosystem components as well as on their net rates of change. (Baker-FRC)

VARIATIONS IN BENTHIC COMMUNITY STRUCTURE IN A SUB-TROPICAL ESTUARY,

Fisheries Research Station, Aberdeen (Hong Kong).
R. S. S. Wu, and J. Richards.
Marine Biology (Berlin), Vol 64, No 2, p 191-198, September, 1981. 9 Fig, 2 Tab, 37 Ref.

Descriptors: *Benthic environment, *Estuarine environment, Estuaries, Coasts, Benthos, Aquatic life, Growth, Population dynamics, Salinity, Sediments, *Hong Kong estuary.

Results are presented of a one year study on the shallow water, benthic community at three stations along an environmental gradient of changing salinity and sediment silt-clay fraction in the Hong Kong estuary. The aims of the study were to provide further information on sub-tropical soft bottom communities and to examine the spatial and temporal variations in the communities in relation to the prevailing environmental gradient. Three sampling sites were established along the north coast of Lantau Island in depths of less than 10 meters. A clear increase in both the total numbers of animals and their biomass was registered when moving from station 1 to 3. The number of different species was highest in March-April and tended to decline over the summer months until September, with a slight increase in October and November. Murex trapa and Portunus hastatoides were abundant at all three stations throughout the year. Salinity was shown to increase from station 3 to station 1. A large decrease in bottom salinity was noted at all stations in the summer months. The proportion of silt-clay fraction in the sediment increased from station 1 to station 3. No significant difference in the organic content of the sediments was noted between the three stations. It was concluded that the total number of animals, biomass as well as the dominance of Turritella terebra in the community decreased, while species diversity increased along a gradient of increasing salinity and decreasing silt-clay fraction of the sediment. THE EFFECT OF TIDAL HEIGHTS ON THE DISTRIBUTION AND ABUNDANCE OF COLIFORM BACTERIA IN THE SEDIMENTS OF TWO SITES IN THE MERSEY ESTUARY,

Manchester Univ. (England). Dept. of Bacteriology.
J. Karthegisan, and M. P. Thomas.
International Journal of Environmental Studies, Vol 14, No 4, p 299-308, 1980. 6 Fig, 5 Tab, 15 Ref.

Descriptors: *Tidal effects, *Coliforms, *Bacteria, Estuaries, *Mersey estuary, United Kingdom, Fate of pollutants, Sewage bacteria, Intertidal areas, Sediments.

Total coliform counts, E. coli type I counts, and viable counts in estuarine sediments were positively correlated with tidal heights in the River Mersey, United Kingdom, as measured during 1976. Chloride levels in the sediments were also highest during the high tide periods. Low tide counts (per 100 ml) were 170-540 total coliforms, 33-240 fecal coliforms, and 100,000 viable. High tide counts were 540-1600 total coliforms, 140-350 fecal coliforms, and 74,000-110,000 viable. (Cassar-FRC)

STUDIES ON THE SALINIZATION OF COASTAL GROUND WATER. I. CONFINED GROUND WATER IN THE NAKA RIVER ESTUARY (IN JAPANESE),

Nara Coll. of Education (Japan). Dept. of Geoscience.
Y. Fukuo, T. Kakinuma, Y. Kishi, and M. Ifuku.
Japanese Journal of Limnology, Vol 41, No 4, p 235-248, 1980. 15 Fig, 14 Ref.

Descriptors: *Saline-freshwater interfaces, *Coastal aquifers, Interfaces, Model studies, Saline water intrusion, Aquifers, Groundwater movement, Coasts, Estuaries, Naka River, *Japan, Pumping, Inflow, Mathematical models.

A model was developed to study the problem of sea water intrusion into coastal aquifers. Spatial distribution of the fresh-salt water interface in the steady state is easily determined in either a confined or an unconfined aquifer with arbitrary plane boundaries. The model is applied to the confined groundwater in the Naka River Estuary, Japan, and the spatial distribution of the fresh-salt water interface investigated for changes in pumping volume or in the inflow rate of groundwater. The calculated contours of chloride ion concentrations were in fairly good agreement with those observed in water from deep test wells. (Cassar-FRC)

DISTRIBUTION OF ANOPLOSTOMA VIVIPARUM (NEMATODA) IN SOUTHAMPTON WATER SEDIMENTS,

Southampton Univ. (England). Dept. of Oceanography.
S. C. Surey-Gent.
Marine Biology (Berlin), Vol 62, No 2/3, p 157-160, May, 1981. 5 Fig, 2 Tab, 9 Ref.

Descriptors: *Estuarine environment, *Nematodes, *Estuaries, Coasts, *Sediments, Aquatic animals, Distribution patterns, Southampton Water, England.

In March of 1975, 36 sediment cores were collected from 12 sites in Southampton Water. These sites ranged from 2 meters above mean low water to 9 meters below mean low water. The flocculant layer over each sample was carefully removed, and then the remainder of the sample was sectioned into 0.5 cm segments. The juveniles, non-gravid females, gravid females and males of the free-living marine nematode Anoplostoma viviparum Bastian showed markedly different distributions within layers of mud from these samples. Of the total population, 92% of the gravid females occurred in the anoxic layer, and 73% of the juveniles occurred in the flocculant layer; non-gravid females and males were found in about equal numbers in both the flocculant and oxidized layers, but none were found in the anoxic layer. The tidal flow pattern appears to represent the main influence on the horizontal distribution of A. viviparum. The vertical distribution suggests that the gravid females remain in the anoxic layer while they produce their young. Movement of the flocculant layer serves as the means of distributing the nematode throughout the estuary. (Baker-FRC)

GRAPHS FOR SALINE WEDGES IN ESTUARIES,

Florida Univ., Gainesville. Dept. of Engineering Sciences.
E. Parthenaides, V. Dermisis, and A. J. Mehta.
Civil Engineering (New York), Vol 50, No 1, p 90-92, January, 1980. 2 Fig, 3 Ref.

Descriptors: *Saline water intrusion, *Channel improvement, *Dredging, Estuaries, Mississippi River, Saline-freshwater interfaces, Case studies, Salinity forecasting, *Graphical analysis.

The shape and longitudinal extent of salt water intrusion in a stratified estuary may be predicted using graphs derived and depicted in this paper. The procedure is illustrated by a case of dredging in the south pass of the Mississippi River. Given values are the freshwater discharge, width, total depth, mean fresh water velocity upstream of the toe of the wedge, fresh water density, and difference between densities of the river and sea water. It was calculated that within the main zone of salinity intrusion for the 45 ft depth, the interface level with respect to the fresh water surface would increase from 1.1 to 3.36 ft for a channel deepening to 50 ft. AVAILABILITY OF DISSOLVED FREE GLUCOSE TO HETEROTROPHIC MICROORGANISMS,

Kiel Univ., (Germany, F.R.). Inst. fur Meereskunde.
K. Gocke, R. Dawson, and G. Liebezeit.
Marine Biology (Berlin), Vol 62, No 2/3, p 209-216, May, 1981. 2 Fig, 3 Tab, 53 Ref.

Descriptors: *Heterotrophic bacteria, *Chemical analysis, *Estuaries, *Glucose, Bacteria, Microbiological studies, Water analysis, Water analysis, Eutrophication.

The concentration of dissolved free glucose was measured in five aquatic biotopes, differing widely in salinity as well as in degree of eutrophication and pollution. The glucose was measured using ion exchange chromatography of sugar-borate complexes, which disclosed glucose concentrations ranging from 4.99 to 9.63 micrograms carbon/liter. No correlation was noted between the amounts of glucose and the trophic characteristics of the biotope. The sum of the transport 'constant' and the natural concentration of glucose was determined as a parameter, using a microbiological method. Instead of being larger, the parameter values were smaller than the concentrations obtained chemically. The range was between 0.62 and 2.72 micrograms glucose-C/liter. Expressed as percentages, the parameter values were between 6.4 and 30.5% of the concentrations of glucose alone. Two reasons might account for the discrepancy. First, not all of the dissolved free glucose may be available to the heterotrophic microorganisms. Second, during the relatively short duration of the experiments, the added C-14 labeled glucose may not be proportionally distributed between the different fractions of the dissolved free glucose. Instead, the fraction of the truly free glucose might be more highly specifically labelled than the absorbed and complexed ones. This would lead to overrepresentation of the presumably small fraction of the truly free form. It is concluded that using the concentration of the dissolved free substances obtained by chemical analysis to calculate flux might be misleading. (Baker-FRC)

RADAR MEASUREMENTS OF ESTUARINE CURRENTS AND TIDES,

Birmingham Univ., (England). Dept. of Electronic and Electrical Engineering.
E. D. R. Shearman.
Nature (London), Vol 286, No 5771, p 333-334, July 24, 1980. 4 Fig, 12 Ref.

Descriptors: *Radar, *Remote sensing, *Estuaries, *Water currents, *Tides, Estuarine environment.

A technique for surface current measurement by high frequency radar in the dekametric band, described by A. S. Frisch and B. L. Weber, has now been used to provide area surveillance data in a form directly comparable with theoretical models. The wavelength spectrum and the directional spectrum of sea waves, both wind-driven and swell, can be measured by using a number of radar frequencies and by directing the radar beam in different directions. The wavelength and the directional spectra of sea waves can be deduced by inversion of the second order features in the radar ECHM spectra from a single patch of ocean at a single radio frequency, promising the capability to characterize sea state over a large area of ocean. The coastal-sited 'ground-wave radar' technique developed by Crombie can give coverage up to about 300 kilometers with suitable power and frequency, while a 'sky-wave radar' using ionospheric reaction covers the area between 1,000 and 3,000 kilometers from the radar. The current measuring technique used by the National Oceanic and Atmospheric Administration uses the Doppler effect to analyze the echoes, sorting returns from each direction by frequency. The direction of arrival is then measured by simple relative phase measurement at separated antennas. Application of this technique to the Cook Inlet in Alaska is discussed. (Carroll-FRC)

A TWO-DIMENSIONAL NUMERICAL MODEL OF THE VERTICAL CIRCULATION OF TIDES IN THE ST. LAWRENCE ESTUARY,

Quebec Univ., Rimouski. Dept. of Oceanography.
C. De Borne de Grandpre, M. I. El-Sabh, and J. C. Salomon.
Estuarine, Coastal and Shelf Science, Vol 12, No 4, p 375-387, April, 1981. 10 Fig, 20 Ref.

Descriptors: *Tides, *Water circulation, *Water currents, Model studies, Estuaries, *St. Lawrence estuary, Rivers, Salinity, *Vertical distribution, Salinity.

The vertical circulation of tides in the St. Lawrence estuary was studied with a two-dimensional model with a vertical grid. The equations were solved by a finite difference initial-value method. The data needed were topographical data of the estuary, relevant tidal heights, and salinity levels at the estuary mouth and landward boundaries. The model produced water height, vertical and longitudinal salinity and velocity distributions. The model was tested by varying the friction and turbulence coefficients. Model results agreed well with observed values. Although the model has limitations, it can be considered a step toward the development of a three-dimensional numerical model for this estuary. THE MEASUREMENT OF DIFFUSION COEFFICIENTS IN THE CONWY ESTUARY,

Birmingham Univ. (England). Dept. of Civil Engineering.
J. R. West, and A. P. Cotton.
Estuarine, Coastal and Shelf Science, Vol 12, No 3, p 323-336, March, 1981. 10 Fig, 2 Tab, 14 Ref.

Descriptors: *Estuaries, *Diffusion coefficient, Tidal rivers, Tidal effects, Conwy estuary, *Salinity, Tracers, Dye releases, Flow measurement.

The application of the continuous source dye tracing technique to a tidal flow in a saline selection of the Conwy estuary is examined. Specific objectives were to define the problems of the experimental technique, to estimate the values of the transverse and vertical diffusion coefficients, and to investigate the possibility of defining their functional dependence on hydraulic parameters. The reach of the Conwy estuary was chosen because it was hydraulically relatively simple when compared with most estuarine channels. The reach used for the diffusion experiments was straight and about 500 meters long, 80 meters wide, and 5 meters deep. The salinity was generally between 15 and 30 kg/cubic meter during injection periods. Suspended solids concentrations were usually low, at less than 100 mg/liter. The dye plume was traversed at least three times at each depth, and at depth intervals of 1 meter at each of three sections located at about 120, 240, and 360 meters from the injection point. A total of two flood and seven ebb experimental runs were suitable for analysis. The accuracy of the experiments could be improved by additional hydrodynamic data, shorter fluorometer response time and better fixing. The transverse diffusion coefficient, which includes secondary flow effects, was dependent on flow direction and tidal range for the low river flow conditions at the site being investigated. Transverse diffusion coefficients agree fairly well with other laboratory and field data for open channel flow having a large width to depth ratio. Tentative results for the transverse Lagrangian integral time scale have been obtained. The vertical diffusion coefficient was larger for the flood tides than for the ebb tides. The values were smaller for the homogeneous flow but were compatible with the small vertical salinity gradients. (Baker-FRC)

NITROGEN AND PHOSPHORUS NUTRITION OF CLADOPHORA IN THE PEEL-HARVEY ESTUARINE SYSTEM, WESTERN AUSTRALIA,

Western Australia Univ., Nedlands. Dept. of Botany.
P. B. Birch, D. M. Gordon, and A. J. McComb.
Botanica Marina, Vol 24, No 7, p 381-387, July, 1981. 6 Fig, 2 Tab, 13 Ref.

Descriptors: *Algae, *Nutrients, Cladophora, Benthic flora, *Peel-Harvey Estuary, *Australia, *Estuarine environment, Nitrogen, Phosphorus, Seasonal variation, Growth rates, Eutrophication, Estuaries.

Cladophora aff. albida (Huds.) Kutz, a nuisance benthic alga growing in the Peel-Harvey estuary system, Australia, appears to store nutrients during winter and spring, periods of high nutrient input, for use in summer and autumn. Tissue nutrient values were usually above the critical concentrations of 21 mg per g dry weight for nitrogen and always below the critical concentration of 33 mg per g dry weight for phosphorus. Nutrient sources are surface sediments and decomposing Cladophora and phytoplankton. The few weeks of high river flow in winter do not allow the Cladophora to reach full storage potential of nutrients. Phosphorus regulation may be an important factor in control of this alga in the estuary. (Cassar-FRC)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

HEALTH ASPECTS OF WATER DESALINATION,

Institute of General and Municipal Hygiene, Moscow (USSR).
G. I. Sidorenki, Y. A. Rachamanin, and E. K. Strijak.
Aqua, No 6, p 339-343, 1981. 4 Ref.

Descriptors: *Desalination, *Public health, *Water quality, Drinking water, *Potable water, Demineralization, Ion exchange, Membrane processes, Reverse osmosis, Electrodialysis, Freezing, Distillation, Water properties, Physical properties.

At present five main methods are used in water desalination programs to provide water for domestic and drinking purposes: distillation, freezing, electrodialysis, reverse osmosis (hyperfiltration) and ion-exchange. Freezing and distillation involve profound structural transformations of the water and changes in its gaseous composition, in the composition of the elements present in it, and in the content of organic matter and microorganisms. The distillate from commercial desalination plants is unsafe and cannot be used in public domestic and drinking water supply systems without further treatment. Water desalinated by distillation is practically lacking in mineral salts. The absence or low content of the salts that make water hard leads to changes in the phosphorus and calcium metabolism, to a reduction in the alkaline phosphatase activity of the blood serum, and to a change in the functional state of the thyroid gland. The biologically important trace element fluorine is almost totally absent from distilled water. The ion-exchange and electrodialysis processes of water desalination have a definite bactericidal and virucidal effect, but a buildup of organic matter on the membranes may be problematic. Water desalinated by electrodialysis must be disinfected. Reverse osmosis methods achieve a higher level of purification. The high alkalinity of water softened by sodium cation exchange is a health drawback, as it leads to shifts in the acid-alkali balance and water-salt metabolism of the organism. A thorough sanitary appraisal must be made of all reagents and structural and process materials, including polymers, used in the various water desalination methods. Recommendations for quality control are offered. (Baker-FRC)

ARTIFICIAL PARTICULATE FOULING OF HYPERFILTRATION MEMBRANES IV. DYNAMIC PROTECTION FROM FOULING,

Rensselaer Polytechnic Inst. Dept. of Chemical and Environmental Engineering.
G. Belfort.
Desalination, Vol 34, No 3, p 159-169, September, 1980. 4 Fig, 2 Tab, 6 Ref.

Descriptors: *Membrane filters, *Cellulose acetate membranes, *Fouling, Particulate matter, Colloids, *Desalination, Wastewater treatment, Wastewater renovation.

Previous studies have demonstrated that the use of a fixed membrane protective cover above the desalting membrane and facing the colloid and salt feed solution can significantly improve fluxes and reduce salt rejections. However, the cost of using the microporous Nuclepore or Millipore membranes as protective covers is prohibitive. This study reports experimental results for a new inexpensive method to reduce submicron colloidal fouling for hyperfiltration membranes. An inexpensive dynamic precoat protective cover using diatomaceous earth is placed on the high pressure feed water side of the asymmetric cellulose acetate membrane. Use of this cover resulted in increased flux ratios as high as 2.3 with decreased salt rejection ratios of 0.49 over unprotected membranes. Other significant benefits include reduced flux-decline with the protective cover as compared to without the cover and significantly easier removal of the colloidal cake/protective cover than of the cake itself. This method of protection is most attractive for high-flux and medium salt rejection applications for colloidal containing feed solutions. Such applications include the treatment of municipal, industrial, and agricultural wastewaters for reuse and possibly pretreatment for sea water reverse osmosis desalination. The use of the protective cover method in pilot and large-scale plant operations is being investigated. (Carroll-FRC)

3B. Water Yield Improvement

EVALUATIONS OF ILLINOIS WEATHER MODIFICATION PROJECTS OF 1976-1980: A SUMMARY,

Illinois State Water Survey Div., Champaign.
S. A. Changnon Jr., and C. F. Hsu.
Circular 148, 1981, 31 p, 8 Fig, 9 Tab, 10 Ref.

Descriptors: *Weather modification, *Rainfall, *Cloud seeding, *Radar, *Weather data collections, Evaluation, Statistics, Meteorology, Rainfall intensity, Rain gages, Rainfall distribution, *Illinois.

This report summarizes the key results of statistical and meteorological assessments of five summer weather modification projects in Illinois. One of the primary goals of this effort is to determine whether summer cloud seeding, using silver iodide, can produce agriculturally beneficial increases in rainfall under varying summer conditions. The basic approach involved a target vs. control area, plus a seeding period vs. historical period evaluations. Data were collected from non-recording raingages, from radar echoes, and from daily rainfall values provided by the National Weather Service. All of the projects involved seeding cumulus clouds during selected periods from mid-June through early September, and were two months or less in duration. The percentage differences (increases or decreases) between the seeded rain and echo values and control values are not statistically or physically significant. In general, the results are mixed. Two projects (years) indicate increases in the target rainfall and/or echoes, one year shows a decrease, and the remainder show no definitive trend. The results also indicate that for various reasons, such as poor photography, the project radar data are often unusable for a meaningful evaluation of possible seeding effects. In addition, all of the projects were of too short a duration to draw significant conclusions. (Atkins-Omniplan)

APPLICATION OF A SINGLE RESERVOIR OPERATION POLICY TO A RAIN WATER CISTERN SYSTEM,
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
A. Lo, and Y. S. Fok.
Water Resources Bulletin, Vol 17, No 5, p 868-873, October, 1981. 7 Fig, 1 Tab, 3 Ref.

Descriptors: *Reservoir operation, *Cisterns, *Water storage, Water consumption, Water harvesting, Rainfall, Tantalus, *Hawaii, Storage capacity, Rain water, Capacity, Feasibility studies, Risks, Water supply.

Rain water cisterns, used in some regions of Hawaii as a primary or supplementary water supply, are economically feasible with proper maintenance and use of a single reservoir operation policy. Dynamic programming analysis was used to study the effects of probable weekly rainfall at Tantalus, Hawaii, and the storage capacity of the cistern on the water consumption policy. A cistern with maximum volume of 37.85 cu m and catchment area of 148.64 sq m receives 4 cu m (1000 gal) for each inch of rainfall. A table summarizes the best combinations of catchment area, storage capacity, optimal draft target, and percent risk for residents of the Tantalus area. A catchment area of 1200 sq ft with 8000 gal cistern has an optimal draft of 2200 gal per week at a 3.5% risk. At the other extreme of the table, a catchment area of 1600 sq ft with 16,000 gal cistern, has an optimal draft of 3000 gal per week at 1.5% risk. The water consumption rate should be lowered if the storage level is low or if the rainfall is low. (Cassar-FRC)

REANALYSIS OF 'GENERALIZED CRITERIA FOR SEEDING WINTER OROGRAPHIC CLOUDS',
Water and Power Resources Service, Denver, CO.
D. Rottner, L. Vardiman, and J. A. Moore.
Journal of Applied Meteorology, Vol 19, No 5, p 622-626, May, 1980. 8 Tab, 1 Ref.

Descriptors: *Cloud seeding, *Statistical analysis, Mathematical studies, Weather modification, Clouds, Orographic precipitation.

Vardiman and Moore (1978) presented the results of a study designed to develop generalized criteria for the seeding of winter orographic clouds. That paper discussed various physical stratifications which indicated the bounds of those meteorological and topographical conditions which were likely to produce positive and negative seeding results (seeding windows). However, continuing investigations of seeding windows using these data revealed a serious systematic bias of the original data set. This bias occurred because the Climax I and Climax II data sets included a large number of no-seed cases which were not within the original strict randomization. When this systematic bias was removed, significant changes were found in both the overall and the stratified results. Use of the corrected data set led to mostly non-significant results. The only window that remained significant was one indicating a decrease when unstable clouds with a blow-over trajectory, low moisture, and cloud-top temperatures less than -30C were seeded. OSMOTIC POTENTIALS OF ROOTS OF ONIONS AND THEIR RHIZOSPHERIC SOIL SOLUTIONS WHEN IRRIGATED WITH SALINE DRAINAGE WATERS,
Techniache Univ., Brunswick (Germany, F.R.). Liechtweiss Inst. for Water Research.
U. Schleiff.
Agricultural Water Management, Vol 3, No 4, p 317-323, 1981. 2 Fig, 2 Tab, 13 Ref.

Descriptors: *Irrigation water, *Root zone, *Water reuse, Onions, Saline water, Drainage water, Salts, Agriculture, Osmotic pressure, Impaired water use, *Saudi Arabia.

The reuse of saline drainage water for irrigation of onions in Saudi Arabia was tested by determining the chloride concentration in rhizospheric soil (the layer immediately surrounding the roots, less than 1 mm thick) directly after watering and after 4 days of water depletion. Electrical conductivities of irrigation waters used were 2.4, 4.0, 6.0, and 8.0 mS per cm, obtained by mixing fresh (2.4 mS per cm) with more saline drainage water. Four hours after irrigation, rhizospheric soil contained 3-4.5 meq chloride per 100 g, 3-5 times greater than nonrhizospheric soil; after 4 days, 9-11 meq per 100 g. Nonrhizospheric soil remained at 0.6-1.5 meq chloride per 100 g during the experiment. The osmotic potentials of the rhizospheric soil were -0.5 MPa to -0.9 MPa upon irrigation and -2.0 to 3.0 MPa after 4 days. The concentration of chloride in rhizospheric soil did not reflect the different chloride concentrations of the irrigation waters. When the chloride level of added water increased 300%, the increase of chloride concentration in rhizospheric soil was 150% initially, 50% after 4 hours, and 20% after 4 days. These results contrast with previous findings that salt concentration of rhizospheric soil increased with salt concentration of applied water. Probably, salt concentration reached a critical maximum which was not exceeded. At this point roots may have stopped absorbing soil water, and translocation of salts from the nonrhizospheric soil ceased. (Cassar-FRC)

M. A. Parra, and G. C. Romero.
Plant and Soil, Vol 56, No 1, p 3-16, 1980. 10 Fig, 17 Ref.

Descriptors: *Irrigation effects, *Salt tolerance, *Conductivity, Saline water, Irrigation, Crop yield, Water quality, Beans, *Impaired water use.

The salt tolerance of green beans was evaluated in a pot experiment using two irrigation regimes. Saline irrigation waters were prepared by adding increasing amounts of NaCl and CaCl2 to tap water to obtain waters with an electrical conductivity of 0.3, 0.5, and 0.7 mmol/liter and sodium adsorption ratio of 4 mmol/liter. Soil salinization was begun on the 20th day and completed on the 30th day by applying 500 and 1000 ml of saline water per pot at intervals. Thereafter, in the wet treatment, plants were irrigated when the water matric potential ranged from -20 to -30 kPa, and in the dry treatment, plants were irrigated when the water matric potential ranged from -40 to -60 kPa. When soil salinity increased and soil moisture decreased, transpiration rates and leaf extension rates decreased. Leaf extension rates were affected more by decreases in soil moisture. Under wet treatment, crop yields were as much as one and one half times larger than dry treatment yields. The common practice of evaluating the salt tolerance of crops by electrical conductivity alone is not as useful as when irrigation regimes are also considered. (Small-FRC)

REPORT OF COMMITTEE ON CONSERVATION, DEVELOPMENT AND UTILIZATION OF WATER RESOURCES.
Journal of the New England Water Works Association, Vol 95, No 1, p 66-71, March, 1981.

Descriptors: *Water conservation, *Water policy, *Regional planning, *New England, Federal jurisdiction, Planning, Water resources development, Water use efficiency.

A synopsis was prepared on water conservation activities at the federal, interstate and state levels as of September 1980, and the relationships of the New England Waterworks Association to these activities was discussed. Activities in water conservation on the federal, interstate, state, and local levels point to increased emphasis on evaluation and use of water saving measures wherever practicable. A study report published on water conservation program development and implementation at the state level is intended to provide guidance in this development, but also contains information on responses of specific states to the need to conserve water. Two studies on evaluation and implementation of water conservation measures in New England have been undertaken by the New England River Basins Ccommission, an interstate/federal planning agency, Massachusetts has taken the lead among the New England states in promoting broad application of conservation principles and technology. The New England Water Works Association may involve itself directly in deliberations on water conservation measures. (Cassar-FRC)

WATER POLICY AT INCO METALS COMPANY, ONTARIO DIVISION MILLS,
Water and Pollution Control, Vol 118, No 5, p 20, May, 1980.

Descriptors: *Water policy, *Water reuse, *Industrial wastewater, Ontario, Canada, Wastewater renovation, Mine wastes, Effluents, Water quality control.

This column presents excerpts from a paper by H. R. Butler, Supervisor, Environmental Control, Ontario Division, Inco Metals Company, presented at a conference of the Canadian Mineral Processors. Inco Metals Company operates 10 mines, three mills, two refineries, a smelter, and an iron ore recovery plant within a 50-kilometer radius of Sudbury, Ontario, and a mine-mill complex on the shore of Lake Shebandowan. The use rate of recycled water in the company's milling operations is more than 95 percent at each mill, both reducing the need for fresh water at the mills and improving the pollutant level of downstream aquatic environments. Effluents from the several facilities are collected in a common receptor, permitting treatment of excess and runoff waters and provision of a process water having a consistent quality. This system also minimizes operating expenses. The mill-mine complex at Lake Shebandowan uses about 330 cubic meters of fresh water per day, with an overall water recycle of 550 cubic meters per day. Mine water is used as flusing water for backfill operations or discharged to the tailings area. The combined tailing supernatant and mine water is used as process water in the mill. (Carroll-FRC)

ESTIMATING DISTRIBUTION UNIFORMITY IN LEVEL BASINS,
Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
A. J. Clemmens, and A. R. Dedrick.
Transactions of the ASAE, Vol 24, No 5, p 1177-1180, 1187, September-October, 1981. 7 Fig, 7 Ref.

Descriptors: *Distribution patterns, *Basins, *Irrigation practices, Mathematical studies, Model studies, Streamflow, Irrigation design, Soil properties, Infiltration rate, Infiltration coefficient, Infiltration.

Factors that control the distribution uniformity of irrigation water applied to level basins were sought, and procedures for estimating the distribution uniformity were presented. Depending on the soil infiltration properties, two types of infiltration functions were studied: a power function for soils that do not reach a constant infiltration rate during an irrigation, and a branch infiltration function for soils that do reach a constant infiltration rate. Of the two methods presented for analyzing the distribution uniformity, the one utilizing a branch infiltration with a constant final infiltration rate is by far the easiest and most straightforward to use. However, the infiltration properties of the soil determine which of the methods is appropriate. For the branch infiltration function, the distribution uniformity is calculated directly. For the power infiltration function, the distribution uniformity has been displayed graphically, since it cannot be computed directly. Both methods for computing distribution uniformity require values for the advance exponent and the advance time. The power function method requires values for the recession time and the infiltration exponent. The branch function method requires values for the final infiltration rate and the average depth of water infiltrated. (Baker-FRC)

DESIGN PROCEDURE OF SPRINKLING LATERALS: THE MATHEMATICAL BACKGROUND OF A COMPUTERIZED AID,
Technion - Israel Inst. of Tech., Haifa. Dept. of Agricultural Engineering.
S. Pleban, and I. Amir.
Agricultural Water Management, Vol 3, No 4, p 269-278, 1981. 2 Fig, 6 Ref.

Descriptors: *Sprinkler irrigation, *Irrigation design, *Conveyance structures, Computer programs, Design criteria, Mathematical studies.

This paper presents the mathematical background of an interactive computer program to aid in designing sprinkling irrigation laterals. Several computer programs are used to solve four cases: (1) discharge and pressure distribution along the lateral, (2) pressure at inflow node + Case 1, (3) lateral diameter + Case 2, and (4) maximum permissible number of sprinklers on the lateral + Case 2. Also introduced as needed are: topography, lateral type and diameter, type of sprinklers and riser, spray between sprinklers, number of sprinklers, pressure at inflow node and maximum discharge differences between extreme sprinklers. The conversational mode and rapid response of the programs allows even unskilled users to run the programs correctly. Computational limits permit a 30-sprinkler maximum. (Cassar-FRC)

WATER USE AND WATER-USE EFFICIENCY OF WHEAT AND BARLEY IN RELATION TO SEEDING DATES, LEVELS OF IRRIGATION AND NITROGEN FERTILIZATION,
Haryana Agricultural Univ., Hissar (India). Dept. of Agronomy.
K. P. Singh, and V. Kumar.
Agricultural Water Management, Vol 3, No 4, p 305-316, 1981. 4 Fig, 4 Tab, 16 Ref.

Descriptors: *Water use efficiency, *Irrigation efficiency, *Grain crops, Wheat, Barley, Fertilizers, Water use, Consumptive use, Evapotranspiration, Agriculture, *India.

Under water stress, barley was more productive than wheat, especially under late seeding conditions. Wheat (Triticum aestivum L.) and barley (Hordeum vulgare L.) were studied in India under timely (mid-November) and late (mid-December) seeding conditions, three irrigation levels (I, one irrigation at crown rooting in wheat and at active tillering in barley; II, as in I plus one irrigation at flowering in wheat and flag-leaf in barley; and III, at 25% available soil water in the active root zone), and four rates of nitrogen application (0, 30, 60, and 90 kg per ha N as calcium ammonium nitrate, divided into two applications). All crops were irrigated to field capacity prior to seeding. Under identical soil water stress barley showed a more favorable leaf water potential and more rapid recovery than wheat. Wheat had a higher transpiration rate than did barley. In irrigation regimes I and II barley used 9 and 21 mm less water, respectively, and outyielded wheat by 27% and 9%, respectively. A 100 mm savings for barley was realized with irrigation regimes I and II as compared with III. In general, water use efficiency decreased with increase in irrigation frequency and delay in seeding. Fertilization increased water consumption by wheat and barley 9% and 8%, respectively, and yield 90% and 100%, respectively, thus increasing water use efficiency. (Cassar-FRC)

MULTIMILLION-ACRE TEA BAG,
Svenson and Associates, Watsonville, CA.
G. Svenson.
Civil Engineering (New York), Vol 50, No 2, p 47-50, February, 1980.

Descriptors: *Irrigation efficiency, *Salts, *Irrigation-return flow, Irrigation practices, Irrigation, Agriculture, Water quality, Water conservation, Crop yield.

On-farm irrigation techniques that reduce return flow and thus reduce the salt concentrates deposited by return-flow water are discussed. Improved irrigation efficiency can reduce salt in the water supply, alleviate shortages of water used for other purposes, and prevent over-irrigation, which is detrimental to crops. One development to aid farmers is the lightweight neutron probe, which can measure soil moisture levels accurately in the field. It can be used to read up to 100 sites per day. A method has been developed for applying the data produced by the probe to the various needs of each field and crop under different weather conditions. A scheduling technique is used which identifies the refill point at which irrigation should occur. This simple method was evaluated on a sprinkler-irrigated 1500 acre potato and grain farm, and yield increases well above the 20-year record were experienced. It is difficult to get farmers to cooperate with the new program, however, because there are no incentives in the water allotment system for conserving water. (Small-FRC)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

1980 PROGRESS REPORT ON BASELINE AQUATIC VEGETATION STUDIES TO DETERMINE THE EFFICACY OF HYBRID CARP (GRASS CARP FEMALE X BIGHEAD CARP MALE) IN TWO CALIFORNIA IRRIGATION CANALS,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
F. L. Nibling, Jr., and J. S. Thullen.
Bureau of Reclamation Report GR-81-11, May 1981. 84 p, 32 Fig, 11 Tab, 10 Ref, 1 Append.

Descriptors: *Aquatic weeds, *Irrigation canals, *Hydrophytes, *Aquatic weed control, Biomass, Myriophyllum, Seasonal distribution, Sago pondweed, Fish, Carp, Hybrid carp, Imperial Irrigation District, California, Baseline studies, Vegetation.

During the 1980 growing season, six field trips were made to develop field techniques and gather information that will eventually be used to document the efficacy of this hybrid carp for controlling aquatic plants (hydrophytes) in irrigation canals. These studies were conducted in the Coachella Valley Water District and the Imperial Irrigation District in southern California. Baseline data were collected on hydrophyte distribution, biomass, and density; root and rhizome biomass; tuber density; and soil composition. In the Coachella Canal, the dominant hydrophyte, Myriophyllum spicatum, was sparse in April, but increased in biomass in each test section throughout the growing season. The hydrophytes in the Wormwood Lateral 3 varied considerably between the test sections. In April, the dominant hydrophyte, Hydrilla verticillata, was sparse throughout the lateral, but by July it had reduced the water-carrying capacity in one section by 50%. Other sections in Wormwood Lateral 3 remained low in biomass throughout the season, with the exception of one section which was dominated by Potamogeton pectinatus and Najas guadalupensis from October through November. The most promising parameters for evaluating the sterile hybrid carp efficacy will likely be hydrophyte biomass, areal coverage, and estimates of relative abundance. (Moore-SRC)

A PLANNING METHOD FOR EVALUATING DOWNSTREAM EFFECTS OF DETENTION BASINS,
Maryland Univ., College Park. Dept. of Civil Engineering.
M. E. Hawley, T. R. Bondelid, and R. H. McCuen.
Water Resources Bulletin, Vol 17, No 5, p 806-813, October, 1981. 2 Fig, 4 Tab, 4 Ref.

Descriptors: *Detention reservoirs, *Flood control, *Storm runoff, Runoff, *Model studies, Planning, Storm water, Hydrologic models, Reservoirs, Flood peak, Urban hydrology.

A simple, reasonably accurate method for evaluating the potential for adverse downstream effects of storm water detention basins is presented. It does not require a computer or a large data base. The time coordinates of runoff hydrographs are estimated using the time-of-concentration and the Soil Conservation Service runoff curve number. The discharge coordinates are obtained from a simple peak discharge equation. When results of this analysis show that downstream flooding would not be increased by the detention basins, further costly hydrologic analyses may be avoided. This method was applied to the Crabbs Branch watershed, Maryland. Results indicated a 15% increase in peak discharge rate, in good agreement with results from a more detailed modeling method. SALINITY AND BIOGENIC MATERIAL IN THE NORTH CASPIAN,

Kaspiiskii Nauchno-Issledovatelskii Inst. Rybnogo Khozyaistva, Astrakhan (USSR).
D. N. Kutunin, and A. N. Kosarev.
Water Resources, Vol 8, No 1, p 19-28, January/February, 1981. 5 Fig, 7 Tab, 12 Ref. Translated from Vodnye Resursy, No 1, p 77-88, January/February, 1981.

Descriptors: *Salinity, *Nutrients, *Environmental effects, Flow regulation, Reservoir releases, *Caspian Sea, *Volga River, USSR, Rivers, Runoff, Phosphorus, Nitrogen, Silica.

Regulation of Volga River runoff has changed the salinity and nutrient distributions in the North Caspian Sea. The spring flood volume decreased by 11% and the fall-winter discharge increased, causing salinity increases up to 1.6 parts per thousand in summer. Maximum freshening has been shifted from July to June, and the area of freshened waters reduced. Vertical salinity gradients decreased in July-August, improving oxygen saturation, and increased in winter. Relative stability in salinity was observed in 1970-75. Marked salinization, up to 11.5 parts per thousand, occurred in the very dry period of 1975-77. Inorganic P decreased by 20% by 1977. Organic P has varied noticeably but is presently at its 1954-59 level. Silicon has also fluctuated widely. Total nitrogen inflow has increased by 180% in 1971-76 as compared with pre-regulation years. The proportion of inorganic to organic N has decreased. Ammonium N levels have decreased in the sea as a whole but increased in some shallow areas. Organic N levels have decreased slightly since regulation. (Cassar-FRC)

AQUATIC WEED RESEARCH IN BRITAIN,

Agricultural Research Council, Oxford (England). Weed Research Organization.
T. O. Robson.
Journal of Aquatic Plant Management, Vol 19, p 47-48, July, 1980. 3 Ref.

Descriptors: *Aquatic weed control, *Weed control, *Drainage systems, Herbicides, Aquatic plants, Water quality control, *England, Fish habitats.

Aquatic weed control in British ditches and rivers is essential to properly drain 3 million acres of valuable agricultural land. Methods of weed control must consider the stringent effluent standards in force and the desirability of maintaining enough aquatic vegetation to support recreational fish habitats. The major problems are not with exotic plants, but with indigenous ones. Mechanical control by cutting is labor intensive, but it does not add chemicals to the environment. Use of newly developed weed cutting machinery is limited because of high costs and difficulties of access on farmed land. Biological control may be possible with the herbivorous grass carp, plant competition, and shade trees on the bank. Herbicides are valuable when total eradication is desired. Newer application methods allow treatments to be selective for a target species and reduce the amount of chemical introduced. (Cassar-FRC)

TRANSLATORY CHARACTERISTICS OF THE MUSKINGUM METHOD OF FLOOD ROUTING--REPLY,

Ahmadu Bello Univ., Zaria (Nigeria). Dept. of Civil Engineering.
M. A. Gill.
Journal of Hydrology, Vol 48, No 3/4, p 369-372, November, 1980. 1 Fig, 4 Ref.

Descriptors: *Mathematical studies, *Hydrodynamics, *Flood routing, Flow characteristics, Mathematical equations, Mathematical models.

This response by the author of the article Translatory Characteristics of the Muskingum Method of Flood Routing to comments by Strupczewski and Kundzewicz argues that the conclusions made by the commentors are not relevant to the substance of the original paper. Gill argues that the conclusions and arguments reached by the commentors were based on results obtained by using the Laplace operator, which is applicable in cases in which the lower limit of the integral is zero. However, the lower limit is not zero in the case of the Muskingum equation, so use of the Laplace operator is not appropriate. Gill argues that if the equation he used to define the initial condition is accepted, the arguments put forth by the commentors have no basis. The physical meaning of the time lag and the initial condition are clarified. Gill suggests that if the system approach predicts negative outflows, in which case the discharge would go upstream, then there must be something wrong with the method in which the system approach was used. THE LINEAR DECISION RULE (LDR) RESERVOIR PROBLEM WITH CORRELATED INFLOWS. I. MODEL DEVELOPMENT,

Wisconsin Univ.-Madison. Dept. of Civil and Environmental Engineering.
E. F. Joeres, G. J. Seus, and H. M. Engelmann.
Water Resources Research, Vol 17, No 1, p 18-24, February, 1981. 16 Ref.

Descriptors: *Flow control, *Reservoir releases, *Model studies, Linear decision rule, Streamflow, Mathematical studies, Reservoirs, *Inflow.

A chance-constrained reservoir optimization model (linear decision rule) has been extended to allow explicit consideration of correlated inflows. A decision rule including predicted flow as a state variable (predictive rule) is contrasted with the rule assuming uncorrelated monthly flows (independent rule) and the rule which uses knowledge of the upcoming period inflow (utopian or perfect hindsight rule). Previous opinions that the linear decision rule models are conservative are contrasted with the ability to make reliable release commitments with the predictive rule. The new rule consistently gives more total scheduled release. (Cassar-FRC)

FLOOD ROUTING PROGRAM,

Howard, Needles, Tammen and Bergendoff, Orlando, FL.
B. L. Golding.
Civil Engineering (New York), Vol 51, No 6, p 74-75, June, 1981. 1 Fig.

Descriptors: *Flood routing, *Computers, Routing, *Flood control, Runoff, Storm runoff, Reservoirs, Computer programs, Detention reservoirs.

A BASIC language program is presented for routing floods through storage reservoirs or detention basins by the storage-indication working curve method. The program for doing flood routing as described follows the general hand computation procedures for reservoir flood routing - utilizing the Storage-Indication Working Curve Method or Modified Puls Method. This procedure assumes that the outflow or discharge from the basin is directly proportional to the storage in the basin. This program required the same initial input information as required by hand computation: a rating curve for the outlet pipe or structure with discharge in cfs for each successively higher water surface elevation, where the basin's water surface elevation is the head on the outlet pipe or structure; and an elevation-storage curve for the detention basin where storage is in acre-feet. Knowing these two relationships, the discharge can be computed which is the actual input to the computer. The program can be easily modified to allow direct entrance of both the rating and storage curves, thus eliminating the hand computation of the discharge-storage relationship. This program is also useful for routing major floods through the large reservoirs. An example is given which indicates all necessary input to route a typical inflow hydrograph through the Brad Creek Reservoir. Discharge through the reservoir outlet structure and storage at each discharge are determined and printed using a user specified routing time of one hour. (Baker-FRC)

DIVERSION OF THE RIVER NEVA,

Technical Univ. of Denmark, Copenhagen. Inst. of Hydrodynamics and Hydraulic Engineering.
F. B. Pedersen, and J. S. Moller.
Nordic Hydrology, Vol 12, No 1, p 1-20, 1981. 5 Fig, 1 Tab, 16 Ref.

Descriptors: *Salinity, *Diversion losses, *Rivers, Water level, Mathematical models, Equations, Estuaries, River Neva, Baltic Sea, *Denmark.

The extent to which the diversion of the Neva River will influence hydrographic conditions in the Baltic Sea and the Danish inland waters was investigated mathematically. Part of the Neva will be diverted into dry regions in the southern USSR to meet an increasing demand for irrigation water. The Baltic estuary system is divided into eight subareas, each characterized by an equation for the mass, the volume, and the dynamic balance (the mixing). The proposed change in river flow is introduced into the equations, and the equations are solved with respect to changes in salinity, discharge, and layer depths in the system. For example, a 25% reduction in Neva discharge would increase salinities by 0.2 to 0.4% throughout the system. If the river diversion had been enacted 80 years ago, a 30-40% higher salinity would now exist in the Baltic Sea. The river diversion would reduce the dynamic stability of the estuary system, making the system more sensitive to changes in external forces such as variations in meteorology. The reduced stability would be caused by the combined effects of an increased salinity and a decreased upper layer depth. (Small-FRC)

THE ECOLOGY OF A LAND DRAINAGE CHANNEL--I. OXYGEN BALANCE,

University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
E. J. P. Marshall.
Water Research, Vol 15, No 9, p 1075-1085, September, 1981. 8 Fig, 3 Tab, 26 Ref.

Descriptors: *Weed control, *Oxygen, *Drainage ditches, Diquat, Herbicides, Pesticides, Dissolved oxygen, Respiration, Aquatic plants, Photosynthesis, Thermal stratification, Ditches, Channels, Ecology.

The ecology of land drainage channels and the effect of weed control using diquat was investigated at 4 stations of varying depth (0.49-1.55 meters) and width (4.6-7.2 meters) within a drainage ditch near Goldcliff, Wales. During summer days considerable vertical differences in temperature (16-28 degrees C) were recorded. Oxygen levels were always low (less than 2 mg per liter) directly above the sediments and up to 20 mg per liter near the surface. Ratios of photosynthesis: respiration varied with the season, from greater than 1 early in the year to lower in August and September. Diquat (maximum concentration 1.0 mg per liter) applied to 2 sites reduced photosynthetic oxygen production to 2.9 g per sq meter per day compared with the control, 15.0 g per sq meter per day. Community respiration declined from 9.1 g per sq meter per day to 6.1 g per sq meter per day. The photosynthesis:respiration ratio dropped from 1.0 to 0.5 soon after spraying but returned to normal 10 days later. Production and respiration increased to normal levels within 15 days. Liquid herbicide applied to the surface of thermally stratified channels will likely remain on the surface until vertical mixing occurs during the night. If the water flows before mixing takes place, some herbicide may be lost, reducing the efficiency of the weed control program. (Cassar-FRC)

STORMWATER DETENTION IN DEVELOPING WATERSHEDS,
Espey Huston and Associates, Inc., Houston, TX.
C. B. Amandes, and P. B. Bedient.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE2, p 403-419, April, 1981. 8 Fig, 4 Tab, 17 Ref.

Descriptors: *Watershed management, *Detention reservoirs, Watersheds, Catchment areas, Drainage area, Storm runoff, Urban runoff, Reservoirs, Retention time, Water pollution control.

A simple procedure is presented for the analysis of stormwater detention storage at the planning stage of watershed development. Effects of various storage volumes on peak storm flows and sediment export were investigated for small residential areas. Impacts on the overall watershed of design rainfall frequency, land use patterns, and the volumes of detention storage provided were evaluated. An actual test watershed was studied under varying design conditions for the calculation of peak flow reductions and suspended solids. The study site was Keegans Bayou in Houston, Texas. The channel is about 7 miles long and drains an area of 12.4 square miles into Brays Bayou and ultimately to Galveston Bay. Dry weather flow is less than 5 cfs and is mainly treated sewage effluent. The lower watershed has been the site of significant urban development, while the upper watershed remains largely undeveloped. Soil in the area is primarily heavy clay falling into the soil conservation Service's Hydrologic Group D. The high runoff potential and prevailing ground slopes of less than 1% make drainage improvements necessary if flood damage is to be prevented. Using a design control level of 12 acre-ft/200 acres, the effects of detention storage on the Keegans Bayou watershed were evaluated for rainfall events of 1 and 2 inches. Results indicated that some reductions in flood peaks and sediment transport are seen with detention controls in only 14% of the developed area. Ten-fold reductions over the uncontrolled case are observed for the fully urbanized, fully controlled scenario. (Baker-FRC)

4B. Groundwater Management

DESIGN AND ECONOMICS OF A SOLAR HEATER AQUIFER STORAGE SYSTEM,
Texas A and M Univ., College Station. Dept. of Chemical Engineering.
S. Tostengard, W. B. Harris, and R. R. Davison.
AIChE Symposium Series, Vol 77, No 210, p 12-20, 1981. 13 Fig, 5 Tab, 8 Ref.

Descriptors: *Solar energy, *Storage, *Aquifer systems, *Heat transfer, *Energy sources, New Mexico, North Dakota, Wells, Design criteria, Economic aspects, Heated water, Groundwater management.

Storage of solar heat in aquifers is simulated for climatic conditions of central New Mexico and North Dakota. The system consists of solar heat collectors, surface storage cells, supply wells, and storage wells. Although efficiency is low in the first year while the aquifer is being heated, it can rise to over 80% after 3-5 years. In warm weather water from the supply well is withdrawn, heated, and injected into the storage well. In cold weather the flow is reversed. Hot water is pumped from the storage well, used for building heating, and injected into the supply well. Efficiency rises with aquifer thickness, with temperature of location, and with total volume. It is desirable to drill more wells (unless well costs are very high) rather than to operate wells at peak load. Surface storage is valuable at high ratios of heater area to well flow volume. With existing federal tax credits, the system is competitive with oil under most circumstances and with gas under favorable circumstances. (Cassar-FRC)

4C. Effects On Water Of Man's Non-Water Activities

ASSESSMENT OF UPPER MISSISSIPPI RIVER FLOODPLAIN CHANGES WITH SEQUENTIAL AERIAL PHOTOGRAPHY,
K. N. Olson.
PhD Thesis, July, 1980. 284 p, 42 Fig, 10 Tab, 108 Ref, 13 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-15024.

Descriptors: *Flood plains, *Land use, *Aerial photography, Sedimentation, Erosion, Spoil banks, *Upper Mississippi River, Environmental alteration, Mississippi River, Minnesota, Iowa.

This study was designed to determine the types and extent of natural and man-influenced changes in floodplain features in the Upper Mississippi River Valley from Minneapolis, Minnesota, to Guttenberg, Iowa, over the 35-year period following completion of the 9-foot navigation project in 1938. The following areal changes have occurred in land cover and land use: Water areas have decreased 4% within the study area due to the sedimentation in backwater areas, deposition of dredged material, and plant colonization and succession. Marsh areas have increased quite uniformly, the increase averaging 7.59% throughout the area. Meadows have decreased and forest increased due to decreased agricultural activity and lower incidence of fire. Emergent aquatics do not show a clearcut case of having uniformly increased or decreased in area. Altered flow patterns, turbidity, and the expansion of marsh vegetation have caused some areas to decrease. Sedimentation has allowed emergent aquatics to become established in other areas. Agriculture has decreased in all pools due to the raised water-tables and lowland flooding and land purchase by the federal government. Residential areas have increased slightly overall, but will probably remain static due to the pattern of federal land ownership and flooding potential. The area of disposal sites of dredged material has increased in all pools due to the continued maintenance activities of the Corps of Engineers. Due to the complexity and difficulties of field access to floodplain areas, a technique involving the comparison of sequential aerial photography is the only practical method of determining precisely and accurately the changes which have occurred over time in land and water surface areas and in land use. Descriptors: *Reverse filters, *Filters, *Erosion control, Sand, Fabrics, Storm drains, Waterways, Dams, Embankments.

Reverse filters may be used to control erosion in embankments and storm drains. These are constructed with the fine material below the coarse. Granular materials of the proper sizes are difficult to obtain because commercial materials have very narrow size ranges. Sometimes natural deposits of the different sized materials in the desired proportions can be found. Often 2 or 3 commercial materials are mixed as desired. Instructions for choosing grain sizes are given. Usually sand can be used for the first layer, and material directly from the rock crusher (if it does not contain too many fines) can be used to protect the sand. (Cassar-FRC)

WATER QUALITY ANALYSES OF THE COLORADO RIVER CORRIDOR OF GRAND CANYON,
B. M. Tunnicliff.
PhD Dissertation, 1980. 183 p, 29 Fig, 21 Tab, 25 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX17772.

Descriptors: *Water quality, *Pollutant Identification, *Recreation, *Enteric bacteria, Bottom sediments, Hazards, Coliforms, Surface water, *Grand Canyon, *Colorado River, River runners.

Water quality analyses in Grand Canyon examined Colorado River and tributary baseline water quality status in relation to recreational float trip use of the river corridor. During the 1972 and 1979 float trip seasons, outbreaks of gastroenteritis occurred among river runners in Grand Canyon. Potentially, the Colorado River or a tributary served as a source or carrier of a pathogen, though this has not been confirmed. Water quality analyses of the Colorado River corridor occurred during the 1978 and 1979 river running seasons. Examination of the extensive river corridor necessitated analyses in the field. A total of 497 water quality samples were

collected over the two seasons. Selected microbial, physical, and chemical parameters were measured to determine baseline water quality status. Data from 1978 and 1979 show that the Colorado River and tributaries have similar bacterial water quality profiles. Surface waters show predominantly low FC densities, indicating high quality waters for recreational activities, however treatment of river and tributary surface water is necessary to assure drinking water quality standards. Bottom sediment analyses modify considerably the water quality status represented by surface water analyses alone. Significant densities of enteric organisms are present in the river and tributary environments, representing an important water quality hazard. Associated with resuspension of bottom sediments is the probability of surface water contamination by enteric organisms. Recreational activities, particularly water play in confined tributary pools, can bring river runners in direct contact with concentrated sediment suspension in surface waters. (Sinha-OEIS)

1981 ANNUAL REPORT - COMMITTEE ON THE ASSESSMENT OF HUMAN HEALTH EFFECTS OF GREAT LAKES WATER QUALITY.

International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Water Quality Board.
November, 1981. 142 p, 6 Tab, 102 Ref, 1 Append.

Descriptors: *Water quality, *Chemical wastes, *Toxicity, *Hazardous materials, *Lakes, Carcinogens, Toxins, Human population, Enteroviruses, Chlorination, Industrial wastes, Monitoring, Microbiological studies, Fish populations, *Great Lakes.

The Committee's 1980 report contained a preliminary review of the toxicological data base for the chemicals listed in the 1978 Great Lakes Water Quality Board Report, and indicated those of concern from an acute and chronic toxicity perspective. The Committee reexamined the data base in 1981 and categorized the chemicals as follows: (1) those posing a threat to man from acute exposure; (2) those causing chronic effects which are subject to regulatory monitoring; (3) those causing chronic effects which are not monitored but should be considered for it; (4) those of minimal health concern; and (5) those having insufficient data to conduct a health hazard assessment. Toxicity was based on six key elements: acute toxicity, carcinogenicity, reproductive effects, heritable mutagenicity, neurobehavioral effects, and chronic adverse effects. Exposure potential, persistence in the environment, and potential for bioaccumulation were also considered in determining if a compound was of actual or potential concern. Careful monitoring and environmental surveillance, using the specific criteria outlined, are recommended to reduce the subjectivity in human health risk assessment. Microbiological monitoring should be continued to reveal trends in water quality as a result of new treatment technologies and to identify industrial byproducts discharged into the Basin. Areas of future concern, such as health impacts of energy production, methods to collect epidemiological data, and exposure to air pollutants are discussed. The appendix lists exposure and toxicity profiles of 91 chemicals found in the Great Lakes. (Atkins-Omniplan)

SURVEY OF POLYCHLORINATED BIPHENYLS IN INDUSTRIAL EFFLUENTS IN CANADA.

Environmental Protection Service, Ottawa (Ontario).
Economic and Technical Review Report EPS 3-WP-81-1, 1981. 19 p, 26 Ref, 5 Tab.

Descriptors: *Polychlorinated biphenyls, *Industrial effluents, *Sediments, *Aquatic environment, *Contaminants, Discharges, Analytical methods, Sampling, Sewage treatment plants, Pulp and paper mills, Steel plants, Aluminum smelter effluents, Chemical plants, Industrial wastewater, Canada, Pollutant identification.

A survey of polychlorinated biphenyls (PCBs) in industrial effluents and process streams in Canada was conducted in two phases. Phase I was an overall screening study with samples taken from various industrial sectors, while in Phase II only those industrial plants identified in Phase I as discharging significant quantities of PCBs in their effluents were sampled. In Phase I, a total of 308 samples were collected and analyzed for PCB concentration. Of the 308 samples tested, 48 were found to contain more than 0.1 ppb of PCBs. Industries identified as having samples containing PCBs were: (1) those using PCBs in their products, (2) those using PCB-containing materials in the operation of equipment, and (3) those using recycled materials contaminated with PCBs in their processes. Samples containing PCBs were also obtained from a number of other industrial facilities and from sewage treatment plants. The Phase II study included sampling a total of 45 effluents from seven selected plants. The results confirmed the findings of the Phase I study. The sources of PCB contamination and the formation of PCBs as inadvertent byproducts of various operations are discussed. (WATDOC)

OCCURRENCE OF RHODOCOCCUS COPROPHILUS AND ASSOCIATED ACTINOMYCETES IN FECES, SEWAGE, AND FRESHWATER,

Leeds Univ. (England). Dept. of Civil Engineering.
D. D. Mara, and J. I. Oragui.
Applied and Environmental Microbiology, Vol 42, No 6, p 1037-1042, December, 1981. 5 Tab, 19 Ref.

Descriptors: *Bioindicators, *Feces, *Animal wastes, Microbiological studies, Indicators, Water pollution sources, Rhodococcus coprophilus, *Actinomyces, Sewage bacteria, Farm wastes, Bacteria, Pollutant identification.

Rhodococcus coprophilus was consistently isolated from animal wastes and water polluted by animal wastes but not from human feces. This actinomycete may have potential as a specific indicator organism for pollution from farm animal wastes. In examinations of 97 samples of feces, R. coprophilus was not recovered from humans, cats, rabbits, rats, mice, or turkeys. In feces from farm animals (cattle, sheep, horses, pigs, hens, ducks, and geese) R. coprophilus numbers ranged from 3900 to 2.5 million per g of feces. R. coprophilus was detected in 100% of feces samples from cattle, sheep, pigs, and horses, but not in laboratory-raised fowls. Stream water contaminated with farm wastes and raw sewage contained average R. coprophilus counts of 13,000-16,000 per 100 ml and 140 to 3700 per 100 ml, respectively. Ratios of fecal coliforms to fecal streptococci could not distinguish between human and animal feces. The ratio of R. coprophilus to total actinomycetes (0.40-0.76) was higher in feces from cattle, sheep, ducks and geese than in feces from pigs (0.43) and fowl (0.13). (Cassar-FRC)

EXTRACTION-SPECTROPHOTOMETRIC DETERMINATION OF SUB-MICROGRAM AMOUNTS OF NITRITE USING 4-NITROANILINE AND NAPHTH-1-OL,

Ravishankar Univ., Raipur (India). Dept. of Chemistry.
A. K. Baveja, J. Nair, and V. K. Gupta.
Analyst, Vol 106, No 1266, p 955-959, September, 1981. 1 Fig, 3 Tab, 13 Ref.

Descriptors: *Nitrites, Water analysis, Nitrogen compounds, *Pollutant identification, Rivers, Spectrophotometry, *Trace levels.

Trace levels of nitrite in river water were successfully determined with a method involving a two-step reaction to form an azo dye, followed by hexanol extraction and spectrophotometric measurement at 610 nm. The two-step reaction consists of: (1) reaction of the nitrite with 4-nitroaniline in the presence of 0.1 M HCl to form 4-nitrophenyldiazonium chloride, and (2) reaction of the diazonium ion with naphth-l-ol to form a purple azo dye. This dye is extracted with hexanol, which is more suitable than butanol, pentanol, isopentanol, or octanol. Absorbance is constant from 15 to 40 C and does not change more than + or - 2% up to 30 hours. The practical range for determination of nitrite by this method is 0.035-0.123 ppm. The 12 river water samples, all diluted from 4 ml to 50 ml prior to analysis, contained 0.36 to 0.83 ppm nitrite, which agreed well with results from the conventional sulfonamide-N-(l-naphthyl)-ethylenediamine dihydrochloride method. Ethylenediaminetetraacetic acid or tartrate masking agents prevented interference from a variety of ions, including Fe, Bi, and Cu. A complete table of tolerances is presented. (Cassar-FRC)

CARBON ISOTOPE FRACTIONATION DURING MICROBIAL METHANE OXIDATION,

Waterloo Univ. (Ontario). Dept. of Earth Sciences.
J. F. Barker, and P. Fritz.
Nature (London), Vol 293, No 5830, p 289-291, September 24, 1981. 2 Fig, 1 Tab, 16 Ref.

Descriptors: *Methane, *Isotope fractionation, *Bacteria, *Carbon isotopes, Methane bacteria, Oxidation, *Groundwater, Carbon dioxide.

Carbon isotope (C12:C13) ratios were investigated in mixed cultures of methane-utilizing bacteria producing CO2 from CH4. The respired CO2 was depleted in C12 relative to the residual CH4 by 2.96% to 0.5%, with the depletion diminishing as the CH4 content decreased. The isotopic fractionation factor varied from 1.0313 to 1.0052. The variation could not be related to temperature, rate of CH4 consumption, or variation in CH4/02 ratios. Although the experiments were carried out at higher temperatures than are found in most groundwaters, the results helped explain observations in three groundwaters from shallow aquifers on the nothern shore of Lake Erie. They all contained small, variable quantities of CH4 (0.4 to 9 cu cm at STP per liter of water). The delta C13 methane ranged from -2.98% to -3.70%. Comparing these values with biogenic methane (delta below -5.0%) and methane in underlying gas deposits (delta -3.68% to -4.44%) it is evident that the methane did not come directly from either methanogenesis or the gas deposits. A possible explanation is that the groundwater contained methane from natural gas which had been partially oxidized by bacteria. Wherever bacterial methane oxidation is posible, the carbon isotope ratio of residual methane may not be a reliable indicator of the origin of the gas. (Cassar-FRC)

RNA SYNTHESIS AS A MEASURE OF MICROBIAL GROWTH IN AQUATIC ENVIRONMENTS. II. FIELD APPLICATIONS,

Hawaii Univ., Honolulu. Dept. of Oceanography.
D. M. Karl, C. D. Winn, and D. C. L. Wong.
Marine Biology (Berlin), Vol 64, No 1, p 13-21, September, 1981. 4 Fig, 6 Tab, 28 Ref.

Descriptors: *Microbiological studies, *Aquatic habitats, Environments, Aquatic life, Eutrophic lakes, Microorganisms, Growth, Bacteria, Freshwater, Seawater, Coastal waters, Hawaii, Ribonucleic acid.

Field applications are considered of the tritium-labeled adenine technique used to study microbial growth in freshwater and marine habitats. Freshwater samples were collected from Krauss Pond, a eutrophic environment dominated by the green alga, Chlorella sp., located at Manoa. Freshwater was also collected from two prawn ponds located in Kahuku, Hawaii. Coastal seawater samples were collected from Kewalo Basin, Kaneohe Bay, on Oahu, Hawaii. Rates of stable ribonucleic acid (RNA) synthesis were calculated from time-series measurements of the uptake of tritium-labeled adenine and labeling of the intracellular adenosine triphosphate (ATP) and stable RNA pools for microbial communities. Most of the variation in total rates of microbial RNA synthesis was attributable to differences in microbial biomass. If total rate data are normalized to living microbial carbon

as based on ATP measurements, the variation in specific rates of RNA synthesis is decreased by a factor of 100 to 1000 for microbial communities from diverse environments. Experiments to determine the importance of light or dark conditions indicated that the uptake and incorporation of tritium-labeled adenine are uncoupled from photophosphorylation. The measurement of rates of stable RNA synthesis of microbial assemblages in nature can provide information which is helpful in studying the in situ growth rates and the response of communities to changes in environmental conditions such as nutrient additions. (Baker-FRC)

RNA SYNTHESIS AS A MEASURE OF MICROBIAL GROWTH IN AQUATIC ENVIRONMENTS. I. EVALUATION, VERIFICATION AND OPTIMIZATION OF METHODS,

Hawaii Univ., Honolulu. Dept. of Oceanography.
D. M. Karl, C. D. Winn, and D. C. L. Wong.
Marine Biology (Berlin), Vol 64, No 1, p 1-12, September, 1981. 7 Fig, 3 Tab, 31 Ref.

Descriptors: *Microbiological studies, *Aquatic habitats, Environment, Aquatic life, Eutrophic lakes, Microorganisms, Growth, Bacteria, Freshwater, Seawater, Coastal waters, Hawaii, Ribonucleic acid.

Laboratory and field experiments are described which were designed to evaluate the validity of the stable RNA synthesis technique as a probe for evaluating the growth rates of microorganisms in nature. Coastal seawater samples were collected from Kewalo Basin, Kaneohe Bay and Waikiki Beach, Oahu, Hawaii. Some samples were also taken from a eutrophic freshwater pond located on the University of Hawaii at Manoa campus. This pond, Krauss Pond, was dominated throughout most of the year by the alga Chlorella sp., and contained a high concentration of particulate organic detritus. Bacteria were frequently associated with particles larger than 5 micrometers. Additional freshwater samples were taken from aquaculture ponds on Oahu, Hawaii. Following addition of tritium-labeled adenine to water samples, microorganisms assimilate it either without any luxury uptake or without any expansion of intracellular adenine nucleotide pools. The calculated rate of stable RNA synthesis tends to be overestimated during the initial time periods of labeling due to kinetic compartmentalization of the nucleic acid precursor pool. Time series analyses decrease the effects of compartmentalization with increasing incubation. Mass-balance radioactivity inventories greatly facilitate the interpretation of nucleic acid precursor assimilation. It was concluded that independent measurements of precursor specific radioactivity are necessary for any elucidation of rates of stable RNA synthesis, and thus microbial growth, in nature. FOSSIL CARBON IN COASTAL SEDIMENTS,

Glasgow Univ. (Scotland). Dept. of Chemistry.
M. S. Baxter, M. J. Stenhouse, and N. Drndarski.
Nature (London), Vol 287, No 5777, p 35-36, September 4, 1980. 1 Fig, 1 Tab, 11 Ref.

Descriptors: *Carbon, *Marine sediments, *Coastal waters, Coal, Carbon radioisotopes, Fuel, *Pollutant identification, Sediments, Estuaries, Scotland, Clyde River, Firth of Clyde, Municipal wastes, Path of pollutants, Radioactive dating.

There is no radioactive carbon-14 in fossil carbon as it occurs in coal, oil, and their derivatives. If even small concentrations of fossil carbon are present within sedimentary materials, anomalously old radiocarbon ages may result. Findings of artificially high carbon-14 ages in the upper 20 centimeters of Baltic Sea sediments in correlation with increased heavy metal concentrations are consistent with the growth of industrial activity in this area. In the past, this increase in radiocarbon age has been regarded as an approximate measure of the extent of pollution of sediment organics by industrial fossil fuels. Analysis of surface sediments from the Clyde Sea area in south-west Scotland shows that natural fossil carbon contributes about 30 percent and industrial fossil fuels about 20 percent of the total carbon. These results indicate that natural fossil carbon contamination must be considered a potential and significant source of error in dating sediments. This natural component occurs at all sediment depths and, if constant, does not preclude estimation of deposition rates. However, the natural input may be added to and masked by anthropogenic releases in recent surficial samples. The two natural fossil components cannot be differentiated unless long cores are available, and considerable errors may occur in evaluating data from surface samples alone. (Carroll-FRC)

GENERAL METHOD FOR DETERMINATION OF PESTICIDE RESIDUES IN SAMPLES OF PLANT ORIGIN, SOIL, AND WATER. III. GAS CHROMATOGRAPHIC ANALYSIS AND CONFIRMATION,

Plant Protection and Agrochemistry Centre, Budapest (Hungary).
A. Ambrus, E. Visi, F. Zakar, E. Hargitai, and L. Szabo.
Journal of the Association of Official Analytical Chemists, Vol 64, No 3, p 749-768, 1981. 8 Fig, 4 Tab, 5 Ref.

Descriptors: *Pesticide residues, *Chromatography, *Water analysis, Pollutant identification, Herbicides, Insecticides.

Pesticide residue analysis methods using only one gas chromatograph in combination with thin layer chromatography and column chromatography were developed. The main criteria for the optimum method were that it be reliable, quick and usable for both screening and confirmation. Many packings of various polarities were tested. The most suitable for general purposes were OV-22 and OV-101. Others tested were NPGS, SE-30 (3% on Gas-Chrom Q), and 1.95% SP-2401/1.5 SP-2250 on Supelcoport. A study on thermionic detector performance suggested that each detector should be optimized individually. Short columns, 45-90 cm, were suitable for screening purposes. Although their resolving power was less than that of longer columns, the time of analysis was much shorter, the MDQ values with the same detector were 5-10 times lower, and lower column temperatures were possible. For confirmation of peak identities, silica gel column chromatography combined with gas-liquid chromatographic analysis on a short column proved useful. A table lists the detectability, recovery, and limit of detection for 163 pesticides. (Cassar-FRC)

GENERAL METHOD FOR DETERMINATION OF PESTICIDE RESIDUES IN SAMPLES OF PLANT ORIGIN, SOIL, AND WATER. II. THIN LAYER CHROMATOGRAPHIC DETERMINATION,

Plant Protection and Agrochemistry Centre, Budapest (Hungary).
A. Ambrus, E. Karoly, A. Fulop, and J. Lantos.
Journal of the Association of Official Analytical Chemists, Vol 64, No 3, p 743-748, 1981. 1 Fig, 3 Tab, 8 Ref.

Descriptors: *Thin layer chromatography, *Pesticide residues, *Water analysis, *Pollutant identification, Chromatography, Carbamate pesticides, Halogenated pesticides, Triazine pesticides, Urea pesticides.

The applicability of thin layer chromatography in screening pesticide residues of unknown origin was tested using several modes of detection. Most practical eluting solvents were methylene chloride and ethyl acetate. Minimum detectable quantities and retention factors are given for 99 pesticides. o-Toluidine and potassium iodide detected carbamates, ureas, triazines, and some other pesticides. p-Nitrobenzenediazonium fluoroborate selectively detected certain carbomates. Bioassay with fungi spores was useful for detection of fungicides; plant extracts did not interfere. Enzyme inhibition was affected by some natural plant materials. Silver nitrate and ultraviolet radiation nonselectively detected halogen-containing compounds and required careful sample cleanup. p-Dimethyl aminobenzaldehyde was good for all ureas and some carbamates. ANALYTICAL REFERENCE MATERIALS. III. PREPARATION AND HOMOGENEITY TEST OF LARGE QUANTITIES OF WET AND DRY SEDIMENT REFERENCE MATERIALS FOR LONG TERM POLYCHLORINATED BIPHENYL QUALITY CONTROL STUDIES,

Canada Centre for Inland Water, Burlington (Ontario).
A. S. Y. Chau, and H-B. Lee.
Journal of the Association of Official Analytical Chemists, Vol 63, No 5, p 947-951, September, 1980. 3 Tab, 9 Ref.

Descriptors: *Polychlorinated biphenyls, *Sample preparation, *Lake sediments, Sediments, Sedimentology, Sample preservation, Sampling.

Preparation of large quantities of wet and dried lake sediments to be used as analytical reference materials for long term polychlorinated biphenyl (PCB) quality control studies is described. Over 500 subsamples, 15 to 20 g each, of well-homogenized and characterized, wet spiked sediment reference material were prepared. For wet samples, about 12 kg of water-saturated sediment was added to three liters of water and 150 gm concentrated HCl and blended for two minutes. For a spiked specimen, the PCB spiking solution in 10 ml of acetone is added to the slurry. This sample can be subdivided. For dry samples, sediment is frozen and then thawed in garbage cans. Water is drained out through holes during the thawing process. The sediment is then freeze-dried, crushed, screened, blended, and blotted. Homogeneity was determined for subsamples in each group. These procedures can be used to prepare wet or dry samples that are either natural or spiked with PCB. (Small-FRC)

IMPROVED MICROBE DETECTION IN WATER SAMPLES,

Public Works, Vol 112, No 6, p 134, 136, June, 1981. 1 Fig.

Descriptors: *Microorganisms, *Microbiological studies, *Filtration, *Electrochemistry, *Escherichia coli, Microscopic analysis, Experimental data, Data interpretation, Bacteria, Water sampling, Sample preparation.

Two techniques, membrane filtration and electrochemical microbial detection, are combined in a new method for detecting microorganisms in water samples. Cells are collected by the filter placed on an absorbent pad moistened with 2.0 ml of trypticase soy broth. The electrodes are positioned on the surface of the filter. The other pad, moistened with soy broth, is placed on top of the electrodes and filter. A retainer ring at right angles to the electrodes maintains constant pressure and close

contact between pads, filter, and electrodes. The dish is sealed with paraffin to reduce moisture. For Escherichia coli, favorable results were obtained with 50 estuarine and 46 water samples tested with the combined technique. Results with Staphylococcus aureus, however, were erratic and not reproducible. (Titus-FRC)

SODIUM REGULATION IN THE TIDEPOOL COPEPOD TIGRIOPUS CALIFORNICUS,

California State Polytechnic Univ., Pomona. Dept. of Biological Sciences.
P. M. McDonough, and D. F. Stiffler.
Comparative Biochemistry and Physiology. A: Comparative Physiology, Vol 69A, No 2, p 273-277, 1981. 5 Fig, 19 Ref.

Descriptors: *Copepods, *Salt balance, *Sodium, *Physiological ecology, Salinity, Crustaceans, Evaporation, Tidal marshes, Tidal flats, Saline water, Seawater, Salt tolerance.

The copepod Tigriopus californicus, which inhabits tidepool areas along rocky coasts of North America, is able to survive a wide range of salinities caused by sudden evaporation or dilution of the media. A study was conducted to see if T. californicus regulates its ionic content by examining the sodium content of whole animal samples over an external range of 0.26-1.45 M sodium. Whole body sodium content increased gradually from 0.2 to 4.0 micromoles/milligram of dry weight with increases in external salinity. Body water content remained constant at 87.5% of body weight. Mean internal levels of sodium and upper and lower limits of extracellular sodium were below the limit of conformity with the external environment. Possible sites of sodium transport were identified on the ventral sides of the copepods through silver staining methods. However, these sites did not stain in the presence of sodium-free medium, ouabain or 2,4-dinitrophenol. These findings suggest a hypoionic regulation of sodium by active transport over the salinity levels tested. (Geiger-FRC)

PRECONCENTRATION OF INORGANIC MERCURY WITH AN ANION-EXCHANGE RESIN AND DIRECT REDUCTION-AERATION MEASUREMENTS BY COLD-VAPOUR ATOMIC ABSORPTION SPECTROMETRY,

Kumamoto Univ. (Japan). Dept. of Chemistry.
I. Sanemasa, E. Takagi, T. Deguchi, and H. Nagai.
Analytica Chimica Acta, Vol 130, No 1, p 149-156, 1981. 1 Fig, 5 Tab, 17 Ref.

Descriptors: *Mercury, *Ion exchange resins, *Sample preparation, Pollutant identification, Atomic absorption spectroscopy, Water analysis, Spectroscopy.

Inorganic mercury ions present at concentrations of 5-30 ng per liter in natural water samples (500 ml) were concentrated by adsorption on 0.2 g of chloride-type anion exchange resin. An ammonium thiocyanate-nitric acid medium was used to ensure a higher oxidation state of Hg and to prevent adsorption onto the container walls. After the resin was filtered, it was transferred to a cylindrical gas bubbler containing sulfuric acid and Sn(2+) solution. The Hg ions adsorbed on the resin were reduced to metallic Hg, which was vaporized by the air stream and measured by atomic absorption at 254 nm. The maximum steady peak was observed 6 min after beginning aeration. (Cassar-FRC)
W82-03268

FLUORIDE DETERMINATION IN WATER: AN OPTIMUM BUFFER SYSTEM FOR USE WITH THE FLUORIDE-SELECTIVE ELECTRODE,

Victoria Univ. of Manchester (England). Dept. of Child Dental Health.
K. Nicholson, and E. J. Duff.
Analytical Letters, Vol 14, No 12, p 887-912, 1981. 1 Fig, 7 Tab.

Descriptors: *Fluorides, *Buffers, Pollutant identification, Water analysis, Potentiometers, Fluoridation, Chemical analysis, Electrodes.

TISAB III M. triammonium citrate was the best in terms of masking ability of 11 buffer systems tested in the determination of fluoride in water using the direct potentiometric electrode method. This buffer was prepared from 58 g NaCl, 57 ml glacial acetic acid, 4 g N,N,N',N'-tetraacetic acid, and 243 g triammonium citrate, adjusted to pH 5.4 with 10 M NaOH and made up to 1 liter. Al and Mg interfered, but BO2, BO3, Ca, H2BO3, and phosphate did not. Not less than 20 min, preferably 24 hours, decomplexing time should be allowed after buffer addition. A temperature of 20 C was preferable to 50 C for analysis. Deterioration on storage suggests that buffers be discarded a week, and not more than 2 weeks, after preparation. (Cassar-FRC)
W82-03269

A NEW VOLTAMMETRIC METHOD FOR THE DETERMINATION OF SILICA TRACES IN WATER,

Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.).
C. S. P. Iyer, P. Valenta, and H. W. Nurnberg.
Analytical Letters, Vol 14, No 12, p 921-931, 1981. 4 Fig, 2 Tab.

Descriptors: *Silica, *Water analysis, Pollutant identification, Voltammetry, Molybdate method, Drinking water, Boiler water, Seawater.

Silica traces were determined in drinking, sea, and boiler water down to the level of 6.4 micrograms per liter by preconcentration of silicomolybdate at the electrode and subsequent voltammetric determination. Ammonium molybdate (1% solution) is added to the sample solution, and the pH adjusted to 1.6 with 0.1 M HCl. After 30 min methylethyl ketone plus citrate buffer is added. The ketone suppresses the alpha form of the silicomolybdate, ensuring that all is in the beta form; the citrate buffer masks interferences from phosphate and excess molybdate. The silicomolybdate is accumulated at the electrode by adsorption at the interface by keeping the initial potential at 0.2V for 2 min and then measuring the peak height at 0.36V. The voltammetric method is more sensitive and simpler than the spectrophotometric molybdenum blue method in comparison analyses using drinking water, seawater, and boiler water. Precision is + or - 10% at a 15 microgram per liter level. (Cassar-FRC)
W82-03270

A SPECTROPHOTOMETRIC METHOD FOR THE DETERMINATION OF ANIONIC SURFACTANTS AT MICROG/LITER LEVELS,

Sydney Univ. (Australia). Dept. of Inorganic Chemistry.
S. R. Bhat, P. T. Crisp, J. M. Eckert, and N. A. Gibson.
Analytica Chimica Acta, Vol 116, No 1, p 191-193, April, 1980. 2 Tab, 4 Ref.

Descriptors: *Surfactants, *Chemical analysis, Water analysis, Saline water, Seawater, Lakes, Rivers, Freshwater, *Spectrophotometry, Photometry, Spectral analysis.

A more sensitive spectrophotometric version of a method for the determination of anionic surfactants based on the extraction of surfactant anions into chloroform as an inner-sphere complex with the bis(ethylenediamine)copper(II) cation is presented. A single extraction is required, and the method is insensitive to ionic interferences. It is applicable to fresh, estuarine and sea water samples. After extraction, 1-(2-pyridylazo)-2-naphthol and diethylamine are added, and copper(II) is subsequently determined spectrophotometrically. With a 200 ml water sample, the detection limit is 5 micrograms/liter, as linear alkyl sulfonic acids. (Baker-FRC)
W82-03289

LEMNA (DUCKWEED) AS AN INDICATOR OF WATER POLLUTION. I. THE SENSITIVITY OF LEMNA PAUCICOSTATA TO HEAVY METALS,

Shinshu Univ., Matsumoto (Japan). Dept. of Public Health.
Y. Nasu, and M. Kugimoto.
Archives of Environmental Contamination and Toxicology, Vol 10, No 2, p 159-169, 1981. 6 Fig, 2 Tab, 22 Ref.

Descriptors: *Duckweed, *Heavy metals, *Water pollution effects, Toxicity, Phytometers, Measurement techniques, Path of pollutants.

The indicator plant method, or phytometer method, may be used to measure the amount of a certain pollutant using a specific plant sensitive to the pollutant. This method requires many plants that are similar in size and character at the time of measurement. In order to serve as an indicator, the plant must be sensitive to the pollutants, the sample of polluted water must be easily taken into the plant, and the condition at which the plant is most sensitive must be known. The environmental conditions affecting the growth and multiplication of Lemna paucicostata (duckweed) in the presence of heavy metals were examined in order to establish a phytometer method for water pollution using the duckweed. The pH of the medium, the concentration and composition of the nutrient in the medium, and the temperature at which cultures were maintained were all found to affect the sensitivity of Lemna to heavy metals. Multiplication of Lemna paucicostata 6746 was highly sensitive to heavy metals when cultured aseptically in a Bonner-Devirian medium (pH 6.1) containing 1 percent sucrose at 25C to 30C, so that many of the heavy metals which occur as pollutants can be detected at a concentration lower than those officially permitted in Japanese waters. (Carroll-FRC)

ANALYSIS OF TRACE ELEMENTS IN SEAWATER. PART II. DETERMINATION OF HEAVY METAL TRACES IN SEA WATER BY X-RAY FLUORESCENCE ANALYSIS WITH TOTALLY REFLECTING SAMPLE HOLDERS,

Institut fuer Anorganische und Angewandte Chemie. Hamburg (Germany, F.R.).
A. Knochel, and A. Prange.
Mikrochimica Acta, Vol 2, No 5/6, p 395-408, 1980. 5 Fig, 4 Tab, 6 Ref.

Descriptors: *X-ray fluorescence, *Heavy metals, *Seawater, Water analysis, Trace elements, Performance evaluation, Pollutant identification.

X-ray fluorescence analysis (XFA) was used to determine many trace elements in seawater using the methods developed in the GKSS-Forschungszentrum, Geesthacht. A special sampling device for deep seawater was used to collect samples in the Baltic Sea. The samples were worked up and analyzed directly on board or were acidified and preserved for analysis in the laboratory. A small chromosorb column was used to separate the elements Fe, Co, Ni, Cu, Zn, Hg, and Pb from the sea-salt matrix as the dithiocarbamates. Then, the heavy metal complexes were eluted with chloroform. Aliquots of the eluate yielded suitable measuring samples for the XRF apparatus. This procedure had detection limits 2 to 3 orders of magnitude better than conventional systems. Also, the reproducibility of results was about 10%. Purity criteria and sources of contamination were discussed for every step of the analytic procedure. (Small-FRC)

ALPHA-PARTICLE RADIOACTIVITY OF HOT PARTICLES FROM THE ESK ESTUARY,

Institute for Marine Environmental Research, Plymouth (England).
E. I. Hamilton.
Nature (London), Vol 290, No 5808, p 690-693, April 23, 1981. 3 Fig, 2 Tab, 21 Ref.

Descriptors: Radioactivity, *Estuaries, *Esk estuary, *Radioactive wastes, Effluents, Estuarine environment, Coasts, Irish Sea, Particulates, *Sediments, Aquatic life.

Studies of the sediment and biota of the Esk Estuary indicate the presence of transuranium radionuclides, which are found in the effluents discharged into the north-east Irish Sea at the Windscale nuclear fuel processing plant, 10 km to the north. Suspended particulate debris samples at the sea surface, bottom sediments and some forms of biota were collected for study in September of 1977. Methods of analysis used in this study were a new dielectric alpha-track detector, CR-39, in association with conventional chemical separation techniques, and alpha-particle spectrometry using surface barrier detectors. Analyses revealed fewer hot particles in buried sediments than in the top 10 cm of sediments, and lower specific activity. Data for Fucus vesiculosus indicates some degree of Pu enrichment. Significant levels of short-lived nuclides were found in undisturbed sediments of the Esk estuary. Dissolution of the hot particles in the Esk is aided by interactions with freshwater and flocculation processes which occur at the salt-freshwater interface. The hot particles associated with particulate water sampled at the sea surface, and thus available for transfer to marine aerosols, have a mean particle diameter suitable for entry into the human lung. (Baker-FRC)

SEPHADEX LH-20 CHROMATOGRAPHY OF EXTRACTS OF MARINE SEDIMENT AND BIOLOGICAL SAMPLES FOR THE ISOLATION OF POLYNUCLEAR AROMATIC HYDROCARBONS,

National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
L. S. Ramos, and P. G. Prohaska.
Journal of Chromatography, Vol 211, No 2, p 284-289, July 3, 1981. 3 Fig, 1 Tab, 13 Ref.

Descriptors: *Hydrocarbons, *Marine sediments, *Chromatography, Marine environment, Tissue analysis, Chemical interference, Crabs, Polynuclear aromatic hydrocarbons.

A two-step procedure is described to isolate polynuclear aromatic hydrocarbons (PAHs) from extracts of sediments and tissues from the marine environment. The procedure combines silica gel chromatography and Sephadex LH-20 chromatography using contaminant-free solvent systems that are safer than benzene. The relatively simple gas chromatograms of PAH fractions isolated by this procedure permit direct quantitation. The gas chromatographic analysis of the unsaturated hydrocarbon fraction of both a sediment extract and a crab hepatopancreas extract following silica gel chromatography revealed a substantial number of compounds that coelute with PAHs and thus interfere with their determination. These interfering large polysaturated aliphatic hydrocarbons were removed on a Sephadex LH-20 column. The method yielded high PAH recoveries and eliminated the need for mass spectrophotometric techniques to separate target compounds from coeluting compounds. (Small-FRC)

CHELATING RESIN CATCHER FOR CAPTURE, PRECONCENTRATION AND DETERMINATION OF TOXIC METAL TRACES (ZN, CD, HG, PB) IN WATERS (CAPTEUR DE RESINE CHELATANTE POUR LE PRELEVEMENT LA PRECONCENTRATION ET LA DETERMINATION DE METAUX TRACES TOXIQUES (ZN, CD, HG, PB) DANS LES EAUX,

Tours Univ. (France). Lab. de Chimie Minerale et d'Hydrologie.
F. Clanet, R. Deloncle, and G. Popoff.
Water Research, Vol 15, No 5, p 591-598, May, 1981. 6 Fig, 3 Tab, 32 Ref.

Descriptors: *Heavy metals, *Ion exchange resins, *Chelation, Metals, Zinc, Cadmium, Mercury, Lead, *Pollutant identification, Chemical analysis, Water analysis, Water sampling, Sample preservation.

Trace metals at the microgram per liter level may be concentrated without alteration using a field collector. The apparatus consists of a Lexan cyclindrical capsule 29 mm in diameter and 10 mm thick, containing Chelex 100 chelating resin. The collector is connected with a detachable filtering apparatus, and the sample water is percolated through. A 1-liter water sample is acidified to pH 1 with concentrated nitric acid and filtered through a 0.45 micrometer membrane. This solid residue is examined by x-ray fluorescence spectrometry. To the filtrate is added 100 ml of soda-citrate buffer and NaOH to change the pH to seven. This solution is percolated through the Chelex-100 resin collector at 1.5 ml per min. The toxic metals (Zn, Cd, Hg, Pb) are eluted with 2 M nitric acid and determined by atomic absorption spectrophotometry or anodic stripping voltammetry or by drying and pelletizing the resin and examination by x-ray fluorescence spectrometry or activation analysis. PRACTICAL TECHNIQUES OF RIVER MONITORING AND POLLUTION FORECASTING, PART 1: CONTINUOUS QUALITY MONITORING AND DATA ACQUISITION,

Anglian Water Authority (England).
D. E. Caddy, and P. G. Whitehead.
Effluent and Water Treatment Journal, Vol 21, No 9, p 407-409, 411, 414, September, 1981. 5 Fig, 3 Tab, 18 Ref.

Descriptors: *Monitoring, Pollution control, Rivers, Water quality, Measuring instruments, Data acquisition, Data processing, Forecasting, *Water pollution sources, Forecasting, *Great Ouse River basin, England.

The present article is the first in a series of three, and describes some features of the instrumentation used in the Great Ouse River basin in eastern England for monitoring and forecasting pollution. The high cost of equipment and the limited range of reliable measurements which can be made impose distinct restrictions on the use of continuous monitoring. In many cases the data obtained from monitoring networks is not fully utilized. Data handling is often inefficient, being based on recorder chart or paper tape systems, or else is performed on expensive but inflexible computer systems. A significant advance in data handling would be provided by the ability to manage and process the data automatically, thus providing data summaries and analyses for management, and to forecast water quality and flow conditions. With the availability of relatively low cost microcomputers it is now possible to develop inexpensive data management and forecasting systems which will make full use of acquired data. In general, instrument reliability can be improved by sample filtration and by automatic cleaning and self calibration of instruments. Greater use of microprocessor control can enhance reliability, and advances in this area are being studied. The modelling of real time data from flow gauges and water quality monitors is being used in operational practice. Such techniques enable operational managers to forecast flow and quality conditions and thereby assess the impact of discharges along critical reaches of rivers. (Baker-FRC)

SIMULATION OF THE TRANSPORT OF ION-EXCHANGING SOLUTES USING LABORATORY-DETERMINED CHEMICAL PARAMETER VALUES,

Illinois Univ. at Urbana. Champaign. Dept. of Civil Engineering.
A. J. Valocchi, P. V. Roberts, G. A. Parks, and R. L. Street.
Ground Water, Vol 19, No 6, p 600-607, November/December, 1981. 9 Fig, 3 Tab, 18 Ref.

Descriptors: *Solute transport, *Ion exchange, *Wastewater disposal, Fate of pollutants, Model studies, Injection wells, Groundwater pollution, Aquifer characteristics, Disposal wells, Wells, *Palo Alto area, California.

Laboratory-determined chemical parameter values (selectivity coefficient and cation exchange capacity) were successfully substituted for expensive field measurements in simulation of the transport of ion-exchanging solutes in groundwater. The model was applied to the direct injection of municipal effluents into an alluvial aquifer in the Palo Alto, California, Baylands region. Analysis of observation well logs and core samples determined porosity, bulk density, and aquifer thickness. Tracer tests with chloride in observation wells produced an approximate velocity field and dispersivity values. Incorporating the above parameter values, the model was used to predict the breakthrough of major cations at the observation wells. Observed and calculated values for sodium, potassium, magnesium, and calcium agreed well, but predicted ammonia breakthrough was earlier and at a higher concentration than observed in the field. INCREASING HYDROGEN ION ACTIVITY OF WATER IN TWO RESERVOIRS SUPPLYING THE SAN FRANCISCO BAY AREA, CALIFORNIA,

California Univ., Berkeley. Dept. of Plant and Soil Biology.
J. G. McColl.
Water Resources Research, Vol 17, No 5, p 1510-1516, October, 1981. 4 Fig, 2 Tab, 26 Ref.

Descriptors: *Reservoirs, *Acidity, Water pollution sources, *San Francisco Bay area, Nitrogen oxides, Air pollution, Chemical composition, *Hydrogen ion concentration, *Hydrocarbons, Nitrous oxides.

A study was conducted to determine if changes had taken place in hydrogen ion concentration over the last 25 years in untreated water of two reservoirs in different watersheds supplying the large, urban complex of the San Francisco Bay area. While no direct link between the chemical characteristics of atmospheric precipitation and reservoir waters can be drawn from the available data, changes in reservoir waters might well be related to broad trends in atmospheric pollution or to other causes such as changes in land use practices. The two Sierra Nevada reservoirs studied were the Pardee and Hetch Hetchy. Weekly measurements taken at the two reservoirs indicate increases in hydrogen ion concentrations during this time period. Based on linear models, the rate of increasing hydrogen ion concentration was the same at both reservoirs and varied concomitantly from year to year. This suggests a common, general cause for the increase. The most likely cause appears to be the increased acidity of atmospheric depositions, especially those resulting from emissions of nitrous oxides by automobiles. Both watersheds are large, and while there have been localized disturbances within each such as mining and logging, these have had only minor effects on the composition of the reservoir waters. It may also be suggested that the increases resulted from carbonic acid, a product of the emission of carbon dioxide from combustion of fossil fuels. However, the magnitude of acidity increase in the reservoirs renders this conclusion unlikely. (Baker-FRC)

TRANSPORT OF ION-EXCHANGING SOLUTES IN GROUNDWATER: CHROMATO-

GRAPHIC THEORY AND FIELD SIMULATION,

Stanford Univ., CA. Dept. of Civil Engineering.
A. J. Valocchi, R. L. Street, and P. V. Roberts.
Water Resources Research, Vol 17, No 5, p 1517-1527, October, 1981. 13 Fig, 2 Tab, 24 Ref.

Descriptors: *Groundwater movement, *Model studies, Simulation, *Solute transport, Chromatography, *Ion exchange, Chromatography, Case studies.

This paper presents an analytical framework based upon the theory of chromatography which permits a priori characterization of certain key concentration profile features. The cases studied include both homovalent and heterovalent exchange in binary and ternary systems. In order to test its validity, the chromatographic analysis is applied to a field project involving direct injection of advanced treated municipal effluent into an aquifer. All of the major features observed in the available field data are accurately predicted by the chromatographic theory. While only binary and ternary systems were considered, it is suggested that many multispecies problems could often be approximated by two or three major components. The close agreement achieved between the simulated and the actual breakthrough curves also indicates that laboratory-determined chemical parameter values can be used in field-scale transport simulations, if the hydrologic and hydrodynamic parameters are chosen to simulate reliably the movement of a conservative tracer. In applying the simulation model to a field transport problem it is anticipated that the most troublesome and expensive effort will be devoted to estimating values of velocity and dispersivity. One drawback of the analysis as presented here is that it provides no information regarding the time required for the theoretical concentration profiles to develop. (Baker-FRC)

CADMIUM IN GAMMARIDAE (AMPHIPODA: CRUSTACEA) OF THE RIVERS WERRA AND WESER: GEOGRAPHICAL VARIATION AND CORRELATION TO CADMIUM IN SEDIMENTS,

Oldenburg Univ. (Germany, F.R.).
G. P. Zauke.
Environmental Pollution, Series B, Vol 2, No 6, p 465-474, 1981. 3 Fig, 3 Tab, 21 Ref.

Descriptors: Sedimentation, *Cadmium, Rivers, *Sediments, Amphipods, Path of pollutants, *Crustaceans, Gammarus, *Werra River, *Weser River, Germany.

The geographical variation of cadmium in Gammarus tigrinus is evaluated as a pre-condition for monitoring the availability of this metal for an important component of the food web of the rivers Werra and Weser. Cadmium concentrations in sediments were analyzed using different sediment fractions and extraction techniques. The animals were collected from stones beneath the water surface so as to ensure comparable environmental conditions. A comparison of the cadmium concentrations in sediment obtained by the application of two different extraction procedures indicates a good agreement between the results. Distinct geographical variations of cadmium in G. tigrinus from the two rivers are a precondition for the study of the availability of cadmium to the organisms within the river system. Since cadmium levels in the sediments may be regarded as an expression of the environmental cadmium supply, the investigation of correlations between cadmium in amphipods and in sediments provides information on cadmium available to the amphipods. The algebraic value of the correlation coefficient supports the hypothesis of a linear relationship between cadmium in gammarids and cadmium in the total sediment. The algebraic value of the correlation coefficient does not support the hypothesis of a linear relationship between cadmium in G. tigrinus and cadmium in the silt fraction of the sediment. Although the relative enrichment factor found for cadmium in G. tigrinus from the river Werra indicates a slightly elevated availability of cadmium in this ecosystem, the literature survey on cadmium in other organisms shows that the rivers Werra and Weser are not highly contaminated by cadmium at present in terms of its availability to amphipods. ZINC IN SEAWATER AND SEDIMENTS,

Athens Univ. (Greece). Inorganic Chemistry Lab.
M. J. Scoullos.
Water, Air, and Soil Pollution, Vol 16, No 2, p 187-207, August, 1981. 6 Fig, 5 Tab, 78 Ref.

Descriptors: *Fate of pollutants, *Zinc, *Industrial wastes, *Gulfs, Path of pollutants, Heavy metals, Water pollution, Seawater, Sediment transport, Marine sediments, Ocean circulation, Organic carbon, Oxidation-reduction potential, Seasonal variation, Aegean Sea, Mediterranean Sea, Gulf of Elefsis.

Particulate and dissolved Zn were measured for one year in sea water of the Gulf of Elefsis near Athens, Greece, and results were compared to Zn levels of other Aegean and Mediterranean Sea areas. Particulate Zn was linearly correlated with the magnetic activity of sediments. The distribution of Zn in the bottom sediments reflected the industrial pollution and its history in the Gulf. Zinc levels in sediments were comparable with those of other known polluted areas of the world, including the Severn Estuary in Britain. A deep part of the Gulf with high organic C levels and seasonal periods of anoxia also had high Zn levels, showing that the acidity of the lower part of the water column acts as a trap for Zn, depending on the seasonal circulation or redox reactions. The top 5 to 10 cm of the sediment column showed great enrichment with Zn due to the non-lattice held inorganic and, to a lesser extent, the organically bound Zn. (Geiger-FRC)

Descriptors: *Lead, *Water pollution sources, *Methylation, *Fate of pollutants, Heavy metals, Chemical reactions, Synthesis, Toxins, Water pollution, Water quality, Microbiological studies, Organic compounds.

The methylation of lead in the environment poses serious threats to water quality and aquatic life. Previous studies have proven the high toxicity of tetraalkyleads, the end products of lead alkylation. Increasing levels of inorganic lead in land waterways and sediments will increase the problem of possible lead methylation. In the belief that biological lead(II) methylation of the reactions of methyl ion donors with neutral and anionic lead compounds were initiated. The synthesis of volatile tetramethyllead and other tetraalkylleads from the reaction of lead(II) salts and other simple reagents in aqueous solution is demonstrated. Me4Pb was readily synthesized in aqueous solutions containing lead(II) salts and methyl iodide, a compound known to occur in natural waters. This finding is significant to the understanding of the chemical synthesis of toxic organoleads as well as mechanisms of microbial methylation. (Geiger-FRC)

ORTHOPHOSPHATE UPTAKE BY PHYTOPLANKTON AND BACTERIOPLANKTON FROM THE LOS ANGELES HARBOR AND SOUTHERN CALIFORNIA COASTAL WATERS,

University of Southern California, Los Angeles. Dept. of Biological Sciences.
D. W. Krempin, S. M. McGrath, J. B. SooHoo, and C. W. Sullivan.
Marine Biology (Berlin), Vol 64, No 1, p23-33, September, 1981. 6 Fig, 2 Tab, 57 Ref.

Descriptors: *Plankton, *Harbors, *Los Angeles Harbor, Phosphates, Bacteria, Absorption, *Coastal waters, Phytoplankton, Aquatic plants, Orthophosphates, Seasonal variation.

Sea water samples were collected 1 meter below the surface from four stations in the outer Los Angeles Harbor and one station located 1.5 km outside the harbor breakwater upcurrent of the harbor excurrent plume. Additional samples were taken at a station, SPC-15, which is 15 km offshore in the San Pedro Channel and at Station RB, 0.5 km offshore from Santa Catalina Island in Isthmus Cove. A phytoplankton-enriched size fraction was retained on a 1 micrometer pore-size filter and accounted for 83% of the total chlorophyll a but only 18% of the total bacteria. A bacterioplankton enriched size fraction passed the 1 micrometer filter but was retained on a 0.2 micrometer filter and was found to contain 82% of the total bacteria but only 17% of the total chlorophyll a. These two fractions accounted for 91 and 9% of the microbial carbon, respectively. P-33 uptake by both size fractions was inhibited by low concentrations of 2,4-dinitrophenol, N-ethylameimide, carbonyl cyanide and m-chlorophenylhydrazone. Low levels of 3-(3,4-dichlorophenyl)-1,1-dimentylurea selectively inhibited the uptake of P-33 by the plankton-enriched fraction, while valinomycin selectively inhibited P-33 uptake by the bacterioplankton-enriched size fraction. Consideration of relative surface areas of phytoplankton and bacterioplankton, their P-33 uptake rates in light and dark, and estimates of the population turnover times emphasized the potential importance of bacterioplankton in community phosphorus metabolism. (Baker-FRC)

UPTAKE OF VIBRIO CHOLERAE BIOTYPE ELTOR FROM CONTAMINATED WATER BY WATER HYACINTH (EICHORNIA CRASSIPES),

Johns Hopkins Univ., Baltimore, MD. Div. of Geographic Medicine.
W. M. Spira, A. Huq, Q. S. Ahmed, and Y. A. Saeed.
Applied and Environmental Microbiology, Vol 42, No 3, p 550-553, September, 1981. 2 Fig, 1 Tab, 19 Ref.

Descriptors: *Water hyacinth, *Human diseases, *Vibrio, Bacteria, Accumulation, Public health, Bangladesh, Path of pollutants.

The association between V. cholerae biotype eltor and the water hyacinth was examined under controlled conditions. The association had been noted in study of the transmission of epidemic cholera in rural Bangladesh. Tanks of 100 liter capacity that were exposed to full sunlight were inoculated and water and plant samples were removed at regular intervals. The association between the plant and contaminant was apparent after a few hours, and by five days the concentration on the plants was 300-fold greater than that of the surrounding water. This is the time period of concern, as almost 80% of detectable cholera infections occur within six days of the index case. Water hyacinth is not eaten by people, but it is free-floating and may be a vehicle for the transmission of V. cholerae biotype eltor through waterways of cholera endemic regions such as Bangladesh. ARSENO-SUGARS FROM BROWN KELP (ECKLONIA RADIATA) AS INTERMEDIATES IN CYCLING OF ARSENIC IN A MARINE ECOSYSTEM,

Western Australian Marine Research Lab., North Beach.
J. S. Edmonds, and K. A. Francesconi.
Nature, Vol 289, No 5798, p 602-604, February, 1980. 2 Tab, 16 Ref.

Descriptors: *Arsenic, *Kelps, *Fish, *Lobsters, Sugars, Marine environment, Foods, Fate of pollutants, Metabolism, Food chains.

Two main arsenical constituents of the brown kelp, Ecklonia radiata, were isolated and identified. Interest in this study was stimulated by the high concentration of arsenic in edible sea animals, which cannot be attributed to seawater arsenic levels. Arsenic is present as arsenobetaine in the western rock lobster and the school whiting. Ecklonia is the major organism that concentrates arsenic in the coastal ecosystem of the western rock lobster and school whiting. The two main arsenical constituents of the kelp were 2-hydroxy-3-sulfopropyl-5-deoxy-5-(dimethylarsenoso)furanoside and 2,3-dihydropropyl-5-deoxy-5-(dimethylarsenoso)furanoside. Each compound seems to have a beta-ribo structure for the sugar system. Evidently, Ecklonia is processing its arsenate uptake by conversion to the sugar derivatives described. (Small-FRC)

REACTOR-RELEASED RADIONUCLIDES IN SUSQUEHANNA RIVER SEDIMENTS,

Oak Ridge National Lab., TN.
C. R. Olsen, I. L. Larsen, N. H. Cutshall, J. F. Donoghue, and O. P. Bricker.
Nature (London), Vol 294, No 5938, p 242-245, November 19, 1981. 3 Fig, 2 Tab, 16 Ref.

Descriptors: *Radiation, *Rivers, Sediments, Sedimentation, Water pollution sources, Powerplants, *Nuclear powerplants, *Susquehanna River, Chesapeake Bay.

Radionuclide activities were measured in surface sediment samples collected from the Susquehanna River and Upper Chesapeake Bay in May and September 1979. The sediment area sampled by each grab was 15 to 20 cm, and the depth of sample was above 10 cm. No evidence was found in the river sediments for gamma-emitting radionuclides which would characterize a rupture of the fuel elements. Although measurable activities of cesium-137 were noted throughout the entire lengths of cores H-3, C-4, E and 14, the activity of reactor produced cesium-134 was generally confirmed within the top 10-15 cm. The deepest appearance of cesium-137 in the sediment core indicates the beginning of significant fallout in 1954, and the deepest appearance of cesium-134 indicates the beginning of significant releases from the reactors. Peaks in the radionuclide profiles may be correlated with the history of fallout or reactor releases to provide additional time stratigraphical reference levels. The reported distributions also document the fate of reactor-released radionuclides and their extent of environmental contamination in the Susquehanna-Upper Chesapeake Bay System. (Baker-FRC)

241AM FROM THE DECAY OF 241PU IN THE IRISH SEA,

Manchester Univ. (England). Dept. of Chemistry.
J. P. Day, and J. E. Cross.
Nature (London), Vol 292, No 5818, p 43-45, July, 1981. 1 Fig, 2 Tab, 20 Ref.

Descriptors: *Radioactive wastes, *Fuel reprocessing, Effluents, Americium-241, Plutonium, Sediments, Coastal waters *Irish Sea, Plumes, *Nuclear powerplants, Powerplants, Path of pollutants.

Americium-241 is a long-lived alpha-emitting nuclide which has become one of the more important marine contaminants arising from the discharge of effluents to the Irish Sea from the nuclear fuel reprocessing plant at Windscale, Cumbria. Both americium and plutonium seem to be largely retained in sediments relatively close to Windscale, and a reservoir of 241Am is building up both from direct deposition and from the radioactive decay of sedimented 241Pu. Attempts were made to estimate quantitatively the size and rate of growth of this reservoir. Using data from Windscale discharges, estimates were made of the probable sedimentary deposition of 241Am and 241Pu over the past 20 years, and calculations were then carried out of the consequent additional ingrowth of 241Am. The latter is now about 600 Ci/year, rising towards a steady state of about 1,200 Ci/year if present rates of discharge of 241Pu are maintained. The present sedimentary reservoir of 241Am is about 18,000 Ci, of which about 4,800 have resulted from 241Pu decay in situ. Measurement of the 241Pu/Pu-alpha isotope ratio in coastal sediments confirms the estimates of 241Pu deposition. Outside the Irish Sea, in the dispersal plume into Scottish waters, the observed 241Am concentration can be accounted for largely by ingrowth from the 241Pu transported in the water mass. (Baker-FRC)

Water Resources Bulletin, Vol 17, No 1, p 62-66, February, 1981. 2 Tab, 5 Fig, 20 Ref.

Descriptors: *Leaching, *Sanitary landfills, *Finite element analysis, *Groundwater, *Water pollution sources, Soil solution, Mathematical studies, Mathematical models, Mass transfer, Calibrations, Flow wells, Prediction, On-site investigations, Areal hydrogeology, *Long Island, New York.

A two-dimensional mathematical model for the migration of ground water contamination was developed. The model uses isoparametric elements, based on the Galerkin formulation and on weighting functions of nonsymmetric form, in formulating the convective-dispersive mass transport equation. The model requires the establishment of initial and boundary contaminant concentrations. In a simulation of leachate migration from a sanitary landfill in Long Island, New York, the chloride ion was chosen as the dispersion tracer, since it is relatively free of chemical reactions which could influence the simulation. Sampling data and extrapolations of chloride concentrations measured from nearby wells were used in the simulation. The model parameters derived in the calibration of the model provided good agreement with the observed field concentrations in the verification period. Further research is necessary to rigorously define the optimal weighting in transient simulations. (Titus-FRC)

HYDROCARBON GEOCHEMISTRY OF THE PUGET SOUND REGION-1. SEDIMENTARY ACYCLIC HYDROCARBONS,

Washington Univ., Seattle. Dept. of Oceanography.
R. C. Barrick, J. E. Hedges, and M. L. Peterson.
Geochimica et Cosmochimica Acta, Vol 44, No 9, p 1349-1362, 1980. 9 Fig, 3 Tab, 41 Ref.

Descriptors: *Sediments, *Hydrocarbons, Aliphatic hydrocarbons, *Puget Sound, *Washington, Sediment-water interfaces, Interfaces, Plankton.

Sediment cores were collected at 23 sites within the inland marine waters of northwestern Washington State in efforts to determine the origins, pathways, and fates of hydrocarbon contamination in the relatively uncontaminated modern coastal environment. Aliphatic hydrocarbon compositions were determined for 79 samples during 1975 and 1976 at 23 mid-channel stations. The top and bottom 2 cm sections were analyzed to determine geographic hydrocarbon distributions and compositional trends. Five additional cores were subsampled at a greater number of depth intervals to provide detailed vertical profiles. A predominant assemblage of primarily odd-numbered high molecular weight n-alkanes derived from the leaf waves of vascular land plants was among the groups of acyclic hydrocarbons noted in the sediment samples. Also found was a suite of naturally-derived fossil hydrocarbons which includes regular C15, C16, C18 and C20 isoprenoid alkanes and n-alkanes over the range n-C14 to n-C35. Although the origin of this particular assemplage of hydrocarbons is not known, it is second in abundance only to the plant wax n-alkanes in Puget Sound sediments. An assemblage of plankton-derived hydrocarbons such as pristane, phytadienes, n-C15 and n-C17 was also found. The low concentrations of these suggest that plankton remains may be rapidly and preferentially destroyed near the sea-sediment interface. The final resolved assemblage consisted of seven different multibranched C20 and C25 compounds, which probably have a common, but as yet unknown, origin. As unresolved complex mixture of anthropogenic hydrocarbons was also noted to be prevalent in most sediments deposited since 1875. (Baker-FRC)

A SYSTEMS MODEL OF STREAMFLOW AND WATER QUALITY IN THE BEDFORD OUSE RIVER SYSTEM – II. WATER QUALITY MODELLING,

Institute of Hydrology, Wallingford (England).
P. Whitehead, B. Beck, and E. O'Connell.
Water Research, Vol 15, No 10, p 1157-1171, October, 1981. 12 Fig, 3 Tab, 42 Ref.

Descriptors: *Water quality, *Stochastic processes, Mathematical studies, Probabilistic process, Monte Carlo Method, Model studies, *Bedford Ouse River, Effluents, Telemetry, Remote sensing, Monitoring, Data processing, *United Kingdom, *Water management.

Water quality modeling is discussed as it relates to the Bedford Ouse Study. In order to assess the likely impact of effluent on the river system and the operational management problems that may thereby arise, dynamic stochastic models of water quality were developed. Realistic dynamic water quality models were seen to be feasible for nontidal river systems. In particular the models described provided a potentially useful and computationally efficient characterization of the flow and water quality phenomena in a river, a characterization which explained the dynamic behavior of chloride, nitrate, dissolved oxygen, and biological oxygen demand and so provided a firm foundation on which to base the investigation of other water quality states. The particular utility of time series analysis techniques was also demonstrated for the identification and estimation of water resource models. The techniques have been applied to a wide range of models from the purely black-box rainfall-runoff models, multivariable 'grey box' models of water quality, to the more detailed differential equation models of water quality. The extended Kalman filter (EKF) and Instrumental Variable methods of recursive estimation provided a powerful general method of data processing well suited to the sort of modelling problems encountered by hydrologists, water quality and water resource engineers. The models presented are intended for use mainly by management. (Baker-FRC)

MICROBIAL ACTIVITY OF TRENCH LEACHATES FROM SHALLOW-LAND, LOW-LEVEL RADIOACTIVE WASTE DISPOSAL SITES,

Brookhaven National Laboratory, Upton, NY.
A. J. Francis, S. Dobbs, and B. J. Nine.
Applied and Environmental Microbiology, Vol 40, No 1, p 108-113, July, 1980. 2 Fig, 5 Tab, 12 Ref.

Descriptors: *Radioactive wastes, *Microorganisms, *Leachates, Microbial degradation, Degradation, Bacteria, Methane bacteria, Denitrification, Anaerobic conditions, Aerobic bacteria, Bacillus, Pseudomonas, Citrobacter, Clostridium.

The abundance, distribution, and growth of microorganisms in waste leachates containing a variety of radionuclides and organics are described so as to begin to evaluate the role of microorganisms in the transformation of radioactive wastes. Water samples were collected from trenches at the disposal sites of Maxey Flats, Kentucky; West Valley, New York; Sheffield, Illinois; and Barnwell, South Carolina. Among the several aerobic and anaerobic bacteria isolated, only Bacillus sp., Pseudomonas sp., Citrobacter sp., and Clostridium sp. were identified. Mixed bacterial cultures isolated from the trench leachates were able to grow anaerobically in trench leachates, which indicates that the radionuclides and organic chemicals present were not toxic to these bacteria. Changes in concentrations of several of the organic constituents of the waste leachate samples were observed due to anaerobic microbial activity. Growth of a mixed culture of trench-water bacteria in media containing a mixture of radionuclides, Co-60, Sr-85, and Cs-134/137, was not affected at total activity concentrations of 260 and 2700 pCi/ml. The finding of active microflora in the trench leachates strongly suggests that they may play a significant role in the transformation of radionuclides and the organic constituents of the waste and thus affect the long-term storage, mobility, and migration of radionuclides from the waste disposal sites into the biosphere. COMMUNITY METABOLISM OF ADENYLATES BY MICROHETEROTROPHS FROM THE LOS ANGELES HARBOR AND SOUTHERN CALIFORNIA COASTAL WATERS,

University of Southern California, Los Angeles. Dept. of Biological Sciences.
S. M. McGrath, and C. W. Sullivan.
Marine Biology (Berlin), Vol 62, No 2/3, p 217-226, May, 1981. 5 Fig, 3 Tab, 41 Ref.

Descriptors: *Seawater, *Plankton, Harbors, Coastal waters, Adenosine, Triphosphate, *Carbon cycle, Eutrophication, Nutrients, *Los Angeles, California.

Adenylates are considered good model compounds for studying carbon cycling in aquatic ecosystems because of their high uptake by microheterotrophs, stability in seawater, and ease of measurement. Identification was made of fluxes and compartments involved in the cycling of total adenylates by a planktonic seawater community. Cell number, biomass and uptake rates for natural microbial populations were measured at in situ substrate concentrations to estimate heterotrophic activity. Seawater was sampled from a depth of 1 meter at intervals, monthly to quarterly, from four stations within the Los Angeles Harbor and from one station about 1.5 km outside the harbor breakwater in San Pedro Channel. The natural concentration of dissolved total adenylates (TA) in coastal seawater had a mean value of 2.8 nmol TA/liter. Within the harbor the specific uptake rate at normal TA concentrations varied 10-fold, from 0.028 in December to 0.28 in August. Half-saturation constant values always exceeded the natural TA concentrations in any given month, and were greater in the harbor than in the channel. Assuming a steady-state condition for the dissolved adenylate pool, a model is proposed in which losses from this pool are balanced by inputs to the pool through inefficient feeding, lysis and decomposition of particulate adenylates. Adenylate input from sewage and activated sludge processing. High adenylate pool input is seen during the summer algal bloom periods. (Baker-FRC)

STUDY OF THE EXPERIMENTAL CONTAMINATION OF THE MARINE PHANEROGAM POSIDONIA OCEANICA (L.) DELILE BY MERCURY COMPOUNDS I. MODALITIES OF THE CONTAMINATION BY MERCURY CHLORIDE. (ETUDE DE LA CONTAMINATION EXPERIMENTALE DE LA PHANEROGAME MARINE POSIDONIA OCEANICA (L.) DELILE PAR LES COMPOSES MERCURIQUES: PARTIE I-MODALITES DE LA CONTAMINATION PAR LE CHLORURE MERCURIQUE,

Aix-Marseille-2 Univ. (France). Lab. de Biologie Marine.
G. Cristiani, R. Gassend, and H. Augier.
Environmental Pollution (Series A), Vol 23, No 2, p 153-162, October, 1980. 2 Fig, 1 Tab, 14 Ref.

Descriptors: *Path of pollutants, *Mercury, *Marine flora, Accumulation, Industrial wastes, Biomagnification, Laboratory studies, Posidonia, Ecosystems, Chemical spills.

Mercuric chloride contamination in the case of a simulated accidental pollution was studied in controlled laboratory in vitro cultures of the fragile marine phanerogam, Posidonia oceanica (L.) Delile, collected near Carry-le-Rouet, France. Atomic absorption spectroscopy showed that rhizomes and especially leaves had a very high capacity for mercury concentration, but with different patterns. The mercury concentration in Posidonia changed with time and depended on the amount of Hg in the culture medium. After a variable time in the water with the initial Hg concentration, the Posidonia released part of the mercury they initially took up into the culture medium. Some physiological and histological disorders were also recorded in the most polluted aquaria. The very high concentration rate of Hg by Posidonia leaves makes these plants very dangerous sources of mercury pollution for numerous marine organisms, especially first-level consumers in the trophic chain. The results cannot be applied to natural media, where concurrent or synergistic operation of physical, chemical and biological factors modify Posidonia behavior. The results indicate the need to study the behavior of Posidonia under chronic pollution, which often occurs in nature, and to test other mercury compounds and the cytological, histological and biochemical changes caused by different types of mercury pollution. SIMULATION OF FLOW PATTERNS AND ION-EXCHANGE IN SOIL PERCOLATION EXPERIMENTS. PART II. ION-EXCHANGE PROCESSES,

Central Inst. for Industrial Research, Oslo (Norway).
N. Christophersen, and H. M. Seip.
Water, Air, and Soil Pollution, Vol 14, p 159-170, 1980. 6 Fig, 1 Tab, 28 Ref.

Descriptors: *Adsorption, *Ion exchange, *Percolation, Model studies, *Path of pollutants, Organic matter, Chelation, Humic acids, Heavy metals, Chemical reactions, Metals, Copper, Lead, Zinc, Cadmium, Magnesium, Calcium, Hydrogen ion concentration, Mathematical models, Soil water movement, Laboratory studies.

The ion exchange processes in raw humus were studied in the laboratory and by simulation analysis. Solutions of sulfuric acid, nitric acid, hydrochloric acid, and sodium chloride, all at 0.01 N, were percolated through 4 cm thick humus samples at a rate of 1 mm per min. The cation-exchange reactions were the most significant processes for the chemical composition of the runoff. Only 1 out of 4 models tried gave results consistent with the laboratory observations. This model has 5 independent parameters and consists of first and second order chemical processes. This is a tentative model, and variations in initial parameter values greater than an order of 2 or 3 produce poor performance. Further experimental work is necessary to confirm the reaction rates, which are slower than those obtained from previous work. Since the curves' minima life within the pH range encountered in natural systems, a small change in pH could affect the solubility and availability of metal ions. The humic acid component can be dominant in systems high in organic matter. (Cassar-FRC)

MAJOR EVAPORITE DEPOSITION FROM GROUNDWATER REMOBILIZED SALTS,

Institute of Geological Sciences, London (England). Geochemistry and Petrology Div.
J. E. Rouse, and N. Sherif.
Nature (London), Vol 285, No 5765, p 470-472, June, 1980. 2 Fig, 10 Ref.

Descriptors: *Groundwater movement, *Salts, *Deposition, Saltation, Brines, Sedimentation, Surface-groundwater relations, Coastal waters, Sulfur, Sediments, Aquifers, *Libya, *Gulf of Sirte, Evaporation, Geohydrology.

The physiography and the sedimentary pattern of the western coastal plain of the Gulf of Sirte was formed by two major transgressive events. Coastal sabkhas developed behind a barrier-ridge complex following sea level rises during the late Pleistocene age, when a barrier island and lagoon were formed, and during the Flandrian transgression, when the sea reached its present level and a second, outer lagoon was established. Isolation of the coastal lagoons by a seaward sand ridge followed the stabilization of the sea level, resulting in the formation of isolated basins in which evaporites have been and are being deposited. A sulfur isotopic study was conducted to determine the sources of the brines being deposited in the sabkhas. This study demonstrated that the extensive supply of sulfur to the sabkhas originates primarily from remobilized sulfate brought to the surface and distributed into the groundwater by several

springs of sulfate or sulfate-chloride facies water. The rate of sedimentation in the lagoons is dependent on the rate and salinity of water flowing from the aquifer and on the aridity of the climate to ensure a sufficiently high evaporation rate. An extensive north-south fault and its satellite fissures provide karstic channels through which deep artesian waters from the sediments of the Upper Cretaceous reach the Miocene strata, following which the water is brought to the surface, as springs and sub-surface flow, into the groundwaters of the sabkha. Current gypsum deposition rates demonstrate the remarkably large amounts of sulfate that can be remobilized in a geologically short period of time and show that significant evaporite deposits associated with marine sediments can be formed from water derived from continental sources. PRELIMINARY POLLUTION SURVEYS AROUND THE SOUTH-WESTERN CAPE COAST. PART 4: SALT RIVER MOUTH, TABLE BAY,

National Research Inst. for Oceanology, Stellenbosch (South Africa).
M. J. Orren, G. A. Eagle, A. H. Fricke, P. J. Greenwood, and H. F-K. O. Henning.
South African Journal of Science, Vol 77, No 4, p 183-188, April, 1981. 4 Fig, 7 Tab, 19 Ref.

Descriptors: *Nutrient, *Wastewater pollution, *Bacteria, Path of pollutants, *Salt River, Table Bay, *South Africa, Dissolved oxygen, Aquatic animals, Invertebrates.

Pollution surveys were conducted in the area of the Salt River, which flows into Table Bay, South Africa. In the 1975 survey, concentrations of nutrients and organics in surface water were very high in the river discharge: 15.1 micromol per cu dm total P, 57.4 micromol per cu dm silicate, 23.0 micromol per cu dm nitrite, 48.0 micromol per cu dm nitrate, and 0.026 mg per cu dm oxygen absorbed from alkaline permanganate. Comparable values for 1980 were much lower: 3.1 micromol per cu dm total P, 7.1 micromol per cu dm silicate, 4.7 micromol per cu dm nitrate, and 0.007 mg per g oxygen absorbed from alkaline permanganate. Both surface water and interstitial water samples were analyzed at 8 points between 100 and 4000 meters from the river mouth. Interstitial waters, more variable than surface waters, were higher in levels of nutrients and organic matter and were near zero, in dissolved oxygen at many sites impacted by the river discharges. Metal levels in sediments collected at these beaches were lower than at unpolluted, control beaches. The meiofaunal population was abnormal up to 4 km from the mouth; the absence of harpacticoid copepods in the first 2 km was indicative of organic pollution. There were more nematodes and harpacticoids in the next 2 km. Total bacterial counts were high, exc[illegible]ing 10,000 per cu cm in the river mouth a[illegible] 100 meters north of the mouth. Although [illegible] saline environment killed many coliforms. the E. coli count was 200 per 100 cu cm at 200 meters from the mouth, showing substantial sewage pollution. (Cassar-FRC)

SEPTIC SEWAGE SYSTEMS CONTAMINATE GROUND WATER,

Ground Water Age, p 36-37, 40, June, 1981. 1 Fig.

Descriptors: *Septic tanks, *Groundwater pollution, Wastewater treatment, Septic wastewater, Wastewater, Water pollution sources, Wastewater renovation, Wastewater management, Wastewater facilities.

Problems and possible solutions to the use of the septic tank as an onsite wastewater disposal system are reviewed. Percolation systems such as septic systems have two basic components; the settling tank and the soil absorption field. Wastewater flows from the house to the settling tank and then to the soil absorption field. Percolation systems rely on three natural processes: filtration, biological degradation, and adsorption. When systems malfunction, wastewater can back up into the home, rise to the surface in the form of surface breakout, or short circuit and move directly into groundwater without adequate purification. Bacteria, viruses, degradable organic compounds, synthetic detergents, and chlorides may contaminate groundwater when conditions lead to failure. Nitrates can accumulate over time and result in relatively high concentrations in the groundwater as well. Systems can fail for a number of reasons. The initial setting, design, or construction could have been faulty or necessary maintenance may be neglected. The best solution to groundwater contamination lies in prevention. However, when systems have failed near urban areas, the usual solution is to abandon the onlot system and extend sewers to an existing, expanded or new treatment plant. Prevention of the problem requires comprehensive wastewater management planning and proper siting, design, construction, and maintenance of all small alternative systems. Regulations have been established concerning inspection and system design evaluation. However, maintenance is not usually a requirement. Some states are taking steps to improve the monitoring and maintenance situations. (Baker-FRC)

GROUND WATER MONITORING: PART II,

T. E. Gass.
Water Well Journal, Vol 34, No 9, p 36-37, September, 1980.

Descriptors: *Groundwater, *Monitoring, *Observation wells, Wells, Subsurface water, Groundwater pollution, Contamination, Pollutants, Borehole geophysics, Geophysics, Boreholes, Resistivity, Path of pollutants.

The use of monitoring wells to study the spread of contamination is described. Such wells may be either pumped or unpumped wells. Active monitoring involves the pumping of wells that intercept potentially contaminated ground water flow. This type of monitoring is best suited for point source contamination. Passive monitoring involves the periodic sampling of wells located in the path of ground water to determination changes in the concentrations of chemical constituents of ground water. The positioning of monitoring wells depends primarily on local hydrogeology and ground water use. All construction materials should be resistant to suspected contaminants. Sampling must be done in such a way as to minimize or eliminate sample contact with the atmosphere. Geophysical techniques used to establish monitoring wells include the borehole methods, electrical resistivity surveying, and seismic surveys. Remote sensing is also useful. (Baker-FRC)

TRACE METAL SPECIATION IN THE FRESHWATER AND ESTUARINE REGIONS OF THE YARRA RIVER, VICTORIA,

Caulfield Inst. of Tech. (Australia). Water Studies Center.
B. T.. Hart, and S. H. R. Davies.
Estuarine, Coastal and Shelf Science, Vol 12, No 4, p 353-374, April, 1981. 6 Fig, 4 Tab, 51 Ref.

Descriptors: *Trace metals, *Heavy metals, *Speciation, Metals, *Estuaries, *Yarra River, *Australia, Rivers, Chelation, Coagulation, Cadmium, Copper, Lead, Zinc, Iron, Fate of pollutants.

Speciation of trace metals was investigated at the freshwater and estuarine sites in the Yarra River, Australia. The metals Cd, Cu, Pb, Zn, and Fe were separated into the following fractions: particulate, filterable, ion-exchangeable, dialysable, and bound. Fe was in bound and particulate form throughout the river system. Cd was predominantly in the ion exchangeable form in both river sections. Filterable Cu existed in ion exchangeable forms--organic complexes in the freshwater and either organic complexes or CuCO3 in the salt water. Pb was largely in the form of PbCO3, and Zn as Zn(2+). Pb and Zn did not form appreciable complexes with organic matter. Between the freshwater and estuarine sections Fe and bound Cd were lost by coagulation. There was little change between the two sections in filterable Cu and ion exchangeable Pb and Zn. However, particulate Pb and Zn increased in the estuarine section. A strong linear relationship was seen for Fe, Pb, Zn and to a lesser extent, Cd, between the total metal and the total bound metal. (Cassar-FRC)

MATHEMATICAL MODELING AND COMPUTER SIMULATION OF RADIOACTIVE AND TOXIC CHEMICAL SPECIES DISPERSION IN POROUS MEDIA IN THE VICINITY OF URANIUM RECOVERY OPERATIONS,

Tennessee Univ., Knoxville. Dept. of Engineering Science and Mechanics.
E. V. Kalmaz, and J. L. Barbieri.
Ecological Modelling, Vol 13, No 3, p 159-181, August, 1981. 3 Fig, 2 Tab, 54 Ref.

Descriptors: *Uranium, *Radioactive wastes, *Mining engineering, Model studies, *Mathematical models, *Path of pollutants, Fate of pollutants, Porous media, Ponds, Chelation, Adsorption, Solute transport, Groundwater pollution, Chemical precipitation, Arsenic, Radium, Thorium, Polonium.

Uranium recovery operations have great potential for releasing radioactive and toxic chemicals to surface and ground waters. About 80% of water used in mill production is lost by seepage. Holding and tailings ponds, chemical storage sites, and transportation may also be sources of contamination to water. Contaminants associated with uranium recovery are radium 226, thorium 230, lead 210, polonium 210, uranium, arsenic, iron, manganese, and sulfate. The mobility of these materials depends on the characteristics of the chemical species and/or the ions and material through which the solution migrates. Oxidized uranium compounds, likely to occur in acid solutions, are extremely mobile. Thorium activity decreases at greater distances from tailings ponds as a result of sorption and coprecipitation with metal oxyhydroxides. Polonium, very stable in the Po(4+) state in solution, is also removed from the system by adsorption or coprecipitation with metal hydroxides. Radium, which forms few complexes, occurs mostly in solution as Ra(2+) ion and precipitates with sulfate. Lead forms several stable complexes and precipitates as the sulfate and carbonate. Arsenic acid (H3As04) is the most common as species in tailings ponds. Iron and manganese oxyhydroxides are active in removing other trace metals from solution. A mathematical model is used to simulate the hydrodynamic dispersion, migration, and prediction of movement for pollutants in supersaturated porous earth. The impacts on water quality associated with in-situ uranium mining, as compared with open pit and underground mining, are more serious. In addition, migration of toxic materials of this type is favored by acidic soils, anaerobic conditions, waterlogged soils, disturbed soils, and coarse soils. (Cassar-FRC)

Descriptors: *Water quality, *Mangrove swamps, *Water pollution effects, *Model studies, Heavy metals, Copper, Ecosystems, Dynamics, Sulfates, Nitrates, Tidal effects, Flushing, Flooding, Pesticides, Runoff, Powerplants, Agricultural runoff.

Many of the ecological and physiological mechanisms that permit the mangrove ecosystem to thrive in intertidal coastal environments that are influenced by freshwater inflow from upland areas are poorly understood. From surveys of mangrove stands, it was found that mangrove ecosystem dynamics could not be related to current theory. The poorest mangrove forest development occurs in arid climates with relatively little ground water or freshewater inflow, and in sedimentary carbonate environments. Highly developed forests occur where tidal amplitude and freshwater inflow assure frequent and extensive inundation and flushing. Synthetic organic pesticides were never found in water, sediment, or plant tissues, but low to moderate concentrations of heavy metals were ubiquitous. Heavy metals were concentrated in sediments and plant tissues. Highest concentrations of metals were associated with fossil-fuel burning power plants, agriculture, and highway runoff. Nitrate and sulfate are key components of water and sediments required for development of mangrove. Nitrate may be most important as an oxidant in anaerobic decomposition of reduced organic matter accompanied by release of nutrients to the rhizosphere and the formation of ammonia. Sulfate appears to act as an oxidant that penetrates deeply into anaerobic sediments during flushing. It can also combine with metals, making them unavailable for uptake by mangroves. A model for the pathway, storage, uptake, and turnover rates of copper is given as an example of the dynamics of a pollutant as it relates to the dynamics of a mangrove ecosystem. (Moore-SRC)

HISTOPATHOLOGICAL CHANGES IN TWO ESTUARINE FISHES EXPOSED TO CRUDE OIL AND ITS WATER-SOLUBLE FRACTIONS,
M. A. Solangi.
PhD Dissertation, August, 1980. 93 p, 78 Fig, 4 Tab, 63 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-09900.

Descriptors: *Water pollution effects, *Pathology, *Sublethal effects, *Oil pollution, Behavior, Mortality, *Fish, Estuaries, Crude oil, Histopathology, Chronic exposure, Hydrocarbon analysis, Menidia beryllina, Trinectes maculatus, Brackish-water fish.

Pathological changes in the liver, olfactory organ, gills, and anterior kidneys of two estuarine fishes, Menidia beryllina (Cope), and Trinectes maculatus (Bloch and Schneider), exposed to different concentrations of both whole crude oil (WCO) and its water-soluble fractions (WSF) are described. Also examined was the status of the sublethal pathological changes of exposed fish after they were returned to an oil-free environment. Results indicate that south Louisiana crude oil and at least some of its components cause sublethal to lethal pathological changes in the gills, olfactory organ and liver. Tissue alterations in these vital organs apparently induced hypoxia, reduced chemoreception, altered schooling behavior, and decreased resistance in stress. Sublethal pathological changes in the gills, olfactory organ, and pancreas such as hyperplasia and hypertrophy of gill epithelium, degenerated neurosensory and sustentacular cells, and degenerated pancreatic tissue appear to be temporary, and once fish return to an oil-free environment they have the ability to recover. Therefore, adult fish exposed to a single oil spill in the northern Gulf of Mexico, in contrast to those chronically exposed or maybe from other geographical areas, have the potential to recover from some degenerative changes. COOLING WATER DISCHARGE INTO FLOODPLAIN MEADOWS AND MARSHES: EFFECTS, MECHANISMS, AND IMPLICATIONS FOR ENVIRONMENTAL ANALYSIS,
Wisconsin Univ.-Madison.
B. L. Bedford.
PhD Thesis, 1980. 191 p, 33 Fig, 4 Tab, 212 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-10062.

Descriptors: *Environmental effects, *Wetlands, *Flood plains, *Cooling water, Water temperature, Aquatic plants, Aquatic populations, Seasonal variation, *Thermal pollution, Powerplants.

The environmental impact statement for the Columbia Electric Generating Station raised but did not answer the question of significant change occurring in wetland plant communities on the site as a result of water leaking from the station's cooling lake. The results of research conducted on the Columbia site from 1974 to 1980 are presented. The Columbia station and associated facilities are located adjacent to and in the floodplain of the Wisconsin River. Most of the site was wetland in its preconstruction state. The major impact on wetland vegetation of discharge from the Columbia cooling lake appears to be the displacement of previously dominant populations. The extent of displacement is complete over approximately one-third of the study area, where environmental changes due to discharge have been greatest. Intermediate level changes in dominant populations have occurred over a larger area covering another third of the study site. Knowledge of the sensitivity of a community's dominant species to a disturbance is likely to provide a better predictor of response to disturbance than either community type or diversity value prior to disturbance. Unlike large open bodies of water where biological effects may be hard to detect or separate from natural variability, the effects of cooling water discharge on communities of emergent aquatic vegetation are obvious and can be monitored and measured as phenological and physiological change at the population level. Results show that species differ in their sensitivity to seasonal changes in temperature, that the mechanisms regulating population response differ among emerging aquatic species, and that relatively minor temperature changes and other environmental factors associated with increased discharge of water, and not necessarily with waste heat, can produce more subtle effects. MICROCOSMS AS TEST SYSTEMS FOR THE ECOLOGICAL EFFECTS OF TOXIC SUBSTANCES: AN APPRAISAL WITH CADMIUM,
Georgia Univ., Athens. Inst. of Ecology.
P. F. Hendrix, C. L. Langner, E. P. Odum, and C. L. Thomas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-209595, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S3-81-036, July, 1981. 4 p. R805860010.

Descriptors: *Toxicity, *Cadmium, *Aquatic environment, *Microcosms, *Ecosystems, Nutrients, Biomass, Environmental effects, Ecological effects.

A two-phase set of experiments was conducted to address some of the problems inherent in ecological screening of toxic substances in aquatic mirocosms, and to test two hypotheses concerning the response of ecosystems to perturbations. Phase I was a 4 x 4 factorial experiment (four levels of cadmium versus four levels of nutrient enrichment) with static microcosms designed to test the subsidy-stress hypothesis. Phase II was a 2 x 4 factorial experiment (continuous and pulsed cadmium inputs versus phosphorus biomass increment hypothesis. Phase I results supported the subsidy-stress hypothesis with respect to cadmium inputs: increasing cadmium concentrations (0, 1, 10, 100 ppb) caused a decrease in the P/R ratio, a decrease in grazing herbivores, increase in nighttime respiration and fungi, all indicators of system stress. Since net daytime production and nighttime respiration increased with nutrient enrichment, there was no nutrient stress effect even at the highest level. There was a significant interaction effect of cadmium and nutrients with high nutrient levels reducing, somewhat, the stress effect of cadmium. Phase II results generally supported the biomass increment hypothesis and suggested a retention pattern for continuous, low concentration cadmium inputs similar to that of essential elements. Cadmium may have accumulated to a toxic threshold in some of the microcosms. Pulsed, high concentration cadmium inputs had significant effects on system behavior, depending on timing of inputs. For screening a suspected toxic substance, a hierarchy of microcosm experiments including static microcosms (with and without sediments), flowthrough microcosms (with and without sediments), and microcosm subsamples from specific natural ecosystems is recommended. (Moore-SRC)

EPIDEMIOLOGICAL STUDIES OF OTITIS EXTERNA: REPOT OF A PROSPECTIVE AND OF A RETROSPECTIVE STUDY OF OTITIS EXTERNA AMONG SWIMMERS,
Yale Univ., New Haven, CT. Dept. of Epidemiology and Public Health.
R. L. Calderon, and E. W. Mood.
Environmental Protection Agency Project Summary EPA-600/S1-81-053, August, 1981. 3 p.

Descriptors: *Swimming, *Water quality, *Epidemiology, *Public health, Coliforms, Pseudomonas, Staphylococcus, Bacteria, *Swimming pools.

Two epidemiological studies of otitis externa were conducted as part of a series of studies to determine if there is a direct relationship between the incidence of otitis externa and the quality of recreational water. One was a prospective study conducted in the summer of 1979 comparing boy scouts at camp who swam in a fresh water lake with boy scouts at another camp who swam in a chlorinated swimming pool. The other was a retrospective study conducted during the summer of 1980. In the prospective study, 3% of the children reported ear complaints in the week following camp, but none had otitis externa confirmed by a physician; the retrospective study compared 29 cases with 29 controls matched by sex and age. In the prospective study, a higher relative humidity at the camp where the boy scouts swam in a chlorinated pool was associated with a greater degree of abnormal flora colonization of the ear (Gram-negative bacteria and Staphylococcus aureus). In the retrospective study, positive association was demonstrated with cases of otitis externa for ambient air temperatures, water temperature, less than 18 years of age, being female, swimming, and length of time spent swimming. There was no association between cases of otitis externa and water quality as measured by fecal coliforms, enterococci, and Pseudomonas aeruginosa or between abnormal

flora colonization of the ear with bacterial indices of water quality. (Moore-SRC)

RESPONSE OF PHYTOPLANKTON TO ACIDIFICATION IN EXPERIMENTAL STREAMS,

Minnesota Univ., Minneapolis.
T. W. Weber, II.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-216822, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S3-81-042, August, 1981. 2 p.

Descriptors: *Phytoplankton, *Acidity, *Stream pollution, *Algae, *Diatoms, Species diversity, Biomass, Acid streams, Hydrogen ion concentration, Experimental data, Ecological effects.

The response of stream phytoplankton communities to acidification was studied in three experimental streams at the Monticello Ecological Research Station in Minnesota at two-week intervals from May 30 to July 11, 1979, Mississippi River water was pumped into three streams; one with an ambient pH of 8.1 and two streams maintained at pH 6.3 and 5.3 by the addition of sulfuric acid. The streams provided a unique replicate system whereby physical and chemical parameters could be controlled and continually monitored in a field situation. The density of phytoplankton in the pH 8.1 and 6.3 streams was highest during the first month of sampling, whereas, in the pH 5.3 stream it was highest in the second month. Phytoplankton density was low in all streams at the end of the sampling periods. The diversity of phytoplankton was similar throughout all three pH regimes. However, phytoplankton community similarity decreased over the course of the experimental period. Species composition was nearly identical across the pH range, dominated by diatoms in each stream. The most extreme pH value, pH 5.3, seemed to be a sublethal value for the diatoms existing there. (Moore-SRC)

LAKE TROPHIC STATE AND ALGAL GROWTH AS INFLUENCED BY CATION CONCENTRATIONS,

Science and Education Administration, Fort Collins, CO.
A. R. Batchelder.
Agricultural Research Service Technical Bulletin No 1649, November, 1981. 8 p, 2 Fig, 7 Tab, 19 Ref.

Descriptors: *Eutrophication, *Algal growth, Calcium, Magnesium, Sodium, *Cations, Standing crops, Eutrophic Lakes, Anabaena, Selenastrum, Chlorella, Trophic level, Saline water, Hardness.

Laboratory experiments were conducted to evaluate the effects of variations in the Ca, Mg, and Na concentrations in eutrophic waters on the standing crop and growth rates of three algal species; Chlorella ellipsoidea, Selenastrum capricornutum, and Anabaena subcylindrica. Each species was grown in a standard nutrient medium enriched with Ca, Mg, and Na in varying combinations and at concentrations of 2 and 8 milliequivalents per liter (meq/L) each. The dry weights of A. subcylindrica and S. capricornutum were reduced by the 8 meg/L Mg treatment but the toxic effects were overcome by adding Ca to the A. subcylindrica and Ca and Na to the S. capricornutum. None of the cation concentration variations affected the standing crop of C. ellipsoidea. The addition of Na alone to the culturesproduced little or no effect, but in combination with added Ca and Mg, it enhanced the growth rates of A. subcylindrica and S. capricornutum. Neither pH, monovalent to divalent cation ratio, or ionic strength of the media affected the algal growth. Based on data for 85 U.S. lakes that were complied from literature, concentration of 0.5 meg/L of Ca, Mg, or Na appears to be a threshold above which the lakes were usually eutrophic. Results demonstrated that Ca, Mg, and Na concentrations need to be considered as factors in saline and hard water eutrophication. (Moore-SRC)

OBSERVATIONS ON A GYRODINIUM AUREOLUM (DINOPHYTA) BLOOM OFF THE SOUTH COAST OF IRELAND,

University Coll., Galway (Ireland). Dept. of Oceanography.
C. Pybus.
Journal of the Marine Biological Association of the United Kingdom, Vol 60, No 3, p 661-674, August, 1980. 7 Fig, 7 Tab, 40 Ref.

Descriptors: *Red tide, *Phytoplankton, *Ireland, Eutrophication, Nutrients, Water quality, Chemical analysis, Nitrogen, *Coastal waters, Phosphorus, Silicon.

Data collected during routine monitoring of the water quality in the vicinity of Kinsale Harbour in waters off the south coast of Ireland are presented. Sampling was performed on August 26 and 30, and September 7 and 19, with an abbreviated sampling on October 15, 1978. Surface phytoplankton samples were also collected on September 2, 5, and 12. During the sampling period the water column was generally well mixed, particularly at the seaward stations. Some stratification was apparent within Kinsale Harbour, and along the coast, reflecting the predominantly coastal flow of the River Bandon. Although several dinoflagellate and diatom species were found, only a few were common throughout the red tide. These were Gyrodinium spirale, and Oxytocum species, Prorocentrum micans, Scripsiella trochoidea, Cerataulina pelagica, Nitzschia spp., Skeletonema costatum and Thalassiosira gravida. The inorganic forms of nitrogen were all present at low concentrations at the beginning of the sampling period. By the second sampling in September these levels approached those of other coastal waters. An upward trend was noted for phosphate-phosphorus. No pattern was noted in the silicate-silicon levels. (Baker-FRC)

EFFECTS OF CLEARCUTTING AND SLASHBURNING ON STREAM TEMPERATURE IN SOUTHWESTERN BRITISH COLUMBIA,

British Columbia Univ., Vancouver. Faculty of Forestry.
M. C. Feller.
Water Resources Bulletin, Vol 17, No 5, p 863-867, October, 1981. 2 Fig, 2 Tab, 19 Ref.

Descriptors: *Stream degradation, *Water temperature, Forest management, *Logging, Watersheds, Forest watersheds, *Clear-cutting, Slashburning, Environmental effects, Stream temperature, Temperature, *British Columbia.

The effects of clearcutting and clearcutting plus slashburning on stream water temperatures were studied in paired forest watersheds in British Columbia. The predominant trees were western hemlock, western red cedar, and Douglas fir. The streams were designated A (61% clearcut), B (19% clearcut and slashburned), and C (undisturbed-control). The harvested watersheds were planted with Douglas fir seedings. Summer water temperatures and daily temperature fluctuations were increased by both treatments. However, after 6-7 years the temperature of the clearcut stream returned to its pretreatment state, whereas the clearcut plus slashburned stream showed no improvement. Although the control stream temperature never exceeded 17 C, the disturbed streams registered maximum temperatures of 21.8 and 20.3 C for A and B, respectively, and exceeded 19 C at other times. Winter temperatures recovered normal values after only 2 years. Clearcutting with slashburning had greater effects than did clearcutting alone. (Cassar-FRC)

DETERGENT BUILDERS AND WATER QUALITY - A CHANGING SCENE,

Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
R. Perry.
Effluent and Water Treatment Journal, Vol 21, No 10, p 446-449, October, 1981.

Descriptors: *Water quality, *Detergents, Eutrophication, Lakes, Water pollution sources, Phosphorus, Nitrilotriacetic acid, *Zeolites, *Water pollution effects.

The current state of affairs regarding the effect of detergents on water quality is reviewed. In various studies, phosphorus has been cited as the limiting nutrient in most surface waters in the northern hemisphere with eutrophication problems. Laundry detergent is made up mainly of two ingredients: a surfactant to remove soils, and a builder to alleviate the effect of the hardness ions present in the water. The most effective builder from the formulation and performance standpoint is sodium tripolyphosphate (STPP), which was in continuous use for more than 30 years. This has become a major component of domestic sewage phosphorus loading and has attracted attention and political regulation in some countries. Utilization of alternative materials could involve vast tonnages of the products concerned. The viable alternatives, namely zeolites and nitrilotriacetic acids, are reviewed in relation to both their performance in the washing cycle and their effect with respect to water quality. Current use of zeolite in detergents worldwide now amounts to about 250 thousand tons, with about 75% of this in North America. Formulations containing zeolites require certain minimum levels of STPP; typical combinations now in use are 18% zeolite and 20% STPP. Nitrilotriacetic acid (NTA) is biodegradable under ideal conditions. However, upon a moderate change of temperature, even down to 5 degrees C, non-degraded NTA is in the position to mobilize heavy metals, forming stable complexes of cadmium and lead. The behavior of this material in the water cycle must be scientifically evaluated, particularly since large quantities of material will be involved. (Baker-FRC)

SUSCEPTIBILITY OF AQUATIC ECOSYSTEMS TO THE EFFECTS OF ATMOSPHERIC POLLUTANT FALLOUT IN QUEBEC.

Scientific Series No 118, 1981. 46 p, Fig, Tab, Ref, 2 Append.

Descriptors: Aquatic ecosystems, Atmospheric pollutants, Alkalinity, Calcium, Susceptibility, Lake water, Chemistry, Analyses, Aquatic environment, *Air pollution effects, *Acid rain, *Lakes, *Ecological effects, *Quebec.

The Quebec Region of the Inland Waters Directorate has a special interest in the evaluation of the sensitivity of aquatic ecosystems to airborne pollutants. The impacts on the aquatic ecosystem have been summarized in a general way in terms of productivity and natural cycles as well as more specifically in terms of water quality, primary food chain (fungi, phytoplankton and macrophytes) and predators (zooplankton, macroinvertebrates, fish, amphibians). By critical review of the various methods used to determine the degree of acidification of surface waters, it is shown that in order to evaluate the sensitivity of Quebec waters one must take into account several integrating parameters such as the pH, calcium, the calcium saturation index, alkalinity, sulphates and minor ions. It is noted that prior to 1979 there is a lack of data for most of these parameters. Interpretative methods are chosen and applied to the available data prior to 1979 for a series of 194 lakes in the province of

Quebec. Also, it is shown that the sensitivity of Quebec lakes can only be determined by combining two different interpretative methods: (1) a method to differentiate between acidified and nonacidified lakes and (2) a method which allows one to evaluate the calcium saturation index of the lakes studied. LAKE DEOXYGENATION AFTER HERBICIDE USE: A SIMULATION MODEL ANALYSIS,

Notre Dame Univ., IN. Dept. of Biology.
S. R. Carpenter, and J. K. Greenlee.
Aquatic Botany, Vol 11, No 2, p 173-186, September, 1981. 6 Fig, 3 Tab, 25 Ref.

Descriptors: *Lakes, *Oxygen depletion, *Herbicides, Water pollution effects, *Model studies, Simulation analysis, Dissolved oxygen, Littoral zone, Macrophytes, Aquatic plants, Water temperature, Water circulation.

A model was developed to simulate the effects of herbicide treatment of macrophytes on the oxygen concentrations in the littoral zones of shallow unstratified lakes. Oxygen dynamics were governed by four processes: diffusion, advection, respiration, and photosynthesis. Several factors in deoxygenation were considered: average water temperature, turnover rate of littoral water, depth of the littoral zone, depth of the pelagic zone, biomass of macrophytes, macrophyte shoot nitrogen concentration, and the source of advective inputs to the littoral zone. None of these factors adequately predicted deoxygenation when considered alone. However, deoxygenation was less likely at low water temperatures, rapid littoral flushing rates, greater littoral depths, low levels of macrophyte biomass, and low tissue nitrogen concentrations. If weather conditions change toward calmer and warmer weather after herbicide application, there is a serious risk of deoxygenation even though conditions during application were optimal. A MODEL RIVER TEST TO DESCRIBE THE VARIOUS IMPACTS OF CHEMICAL SUBSTANCES ON MICROBIAL BIOCOMMUNITIES,

Karlsruhe Univ. (Germany, F.R.). Inst. of Bioengineering and Biotechnology of Wastewater.
P. Wilderer.
AIChE Symposium Series, Vol 77, No 209, p 205-213, 1981. 15 Fig, 9 Ref.

Descriptors: *Water pollution effects, *Model studies, Rivers, Biodegradation, Toxicity, Organic compounds, Microorganisms, *Microbiological studies, Biochemistry, Chemical reactions, *Ecological effects.

A test method is described which was used to study the effects of chemical substances on aquatic microbial systems. The test method contains both continuous flow experiments to simulate the chain of ecological elements in biological wastewater treatment and self purification systems and batch experiments to quantify the impacts of particular substances on specific biocommunities in the various ecological elements. The test is based on a series of ecological systems developed in a laboratory model river consisting of a number of small aerated reactor vessels connected in series to form a reactor cascade. Subsequently the wastewater constituents and the metabolities produced are degraded by a series of biocommunities established throughout the course of the cascade. The study concluded that criteria such as biodegradability, persistence or toxicity are not primarily properties of any chemical substance, but properties of ecological systems. Of the four test substances used, diethyleneglycol, 4-nitrophenol, 2-methyl-2-,4-pentanediol, and thioglycolic acid, all were persistent before adaptation and two were toxic. After an adaptation period, all were biodegradable and less toxic. To eliminate these four substances, two mutually exclusive operating conditions are needed. A high F/M ratio is needed to remove 4-nitrophenol and thioglycolic acid, whereas low loading conditions must be maintained to eliminate the other two. (Baker-FRC)

PHOSPHORUS AND NITROGEN BUDGETS OF BARTON BROAD AND PREDICTED EFFECTS OF A REDUCTION IN NUTRIENT LOADING ON PHYTOPLANKTON BIOMASS IN BARTON, SUTTON AND STALHAM BROADS, NORFOLK, UNITED KINGDOM,

University of East Anglia, Norwich (England). School of Environmental Sciences.
P. L. Osborne.
Internationale Revue der Gesamten Hydrobiologie, Vol 66, No 2, p 171-202, 1981. 16 Fig, 5 Tab, 49 Ref.

Descriptors: *Lakes, *Eutrophication, Phytoplankton, Phosphorus, Nitrogen, *Nutrients, Biomass, Macrophytes, Wastewater, Drainage water, Water pollution effects, Barton Broad, *England.

Seasonal variations in phytoplankton standing crops and the sources, seasonal cycles and supply of phosphorus and nitrogen were studied in three shallow, eutrophic lakes and their inter-connecting river. The Norfolk Broads are a series of shallow lakes associated with five main rivers. The lakes were formed during flooding of peat excavations. They are shallow freshwater lakes in which nutrient enrichment has resulted in replacement of a diverse macrophyte flora with large populations of phytoplankton. Phytoplankton pigment concentrations were relatively low at all stations during the winter, but concentrations increased at all stations in spring in response to increased temperatures and light intensities and a reduced flushing rate. Chlorophyll a concentrations were very high in summer: a maximum of 584 mg/cubic meter was recorded in Barton Broad. Nitrogen loadings on Barton Broad were estimated at 186-202 g N/sq m/year, of which 116 g was attributed to land drainage and the balance to sewage effluent sources. Total phosphorus loading was 18-22 g/sq m/year; over 80% of this was derived from sewage sources. About half of the P entering the River Ant-Broads system is stored in sediments, while 7-10 g/sq m/year enters Barton Broad dissolved and suspended in the water. It is suggested that an 80% reduction in the phosphorus content of sewage effluents entering the River Ant above Barton Broad would allow restoration of submerged macrophytes. (Baker-FRC)

EUTROPHICATION, ACCELERATED BY POLLUTION,

Societe Lyonnaise des Eaux et de 1 ' Eclairage (France). Lab.
M. M. Rizet.
Aqua, Vol 5, p 9-10, 13-15, 1981. 5 Fig, 2 Tab, 26 Ref.

Descriptors: *Eutrophication, *Water pollution control, Water pollution sources, Water pollution treatment, Nitrogen, Phosphorus, Drinking water, Potable water, Organic compounds.

Consideration is given to the problems of a eutrophic and dystrophic aqueous environment that is too highly nourished by exogenous intake. Oligotrophy can be considered to be the initial state of an aquatic biotope in a zone poor in nutrients. Such a biotope is itself inescapably liable to eutrophication. The essential point is the kinetics of this process, which is extremely variable. The process can be noticeably accelerated by natural or artificial happenings. Human activity, urbanization, industry, and intensive agriculture can significantly accelerate the eutrophication of receiving water. The specific impact of mineral elements brought to the water area can be direct, by metabolism of the dissolved elements. Considerable density of biomass complicates the preparation of drinking water. Taste and smell are the result of the presence of living algae or the products of their decomposition. Toxicity of metabolities emitted by certain algae has been the cause of acute mammalian intoxications. The fight against eutrophication must be waged where pollution sources enter the environment. The non-point input arising from agriculture can be reduced by more rational use of fertilizer products. The chemical industry is proposing substitutes for phosphate detergents. Nitrogen and phosphorus carried by domestic or industrial wastewater can be eliminated from water by physico-chemical or biological precipitation, by bioconsumption in lagoons, or by decomposition of nitrogen to the gaseous state. The limitation of excessive richness in nutritive elements and especially the limitation of algae development can be obtained by causing effective mixing of influent water. (Baker-FRC)

THE STRUCTURE OF BENTHIC COMMUNITIES IN AN AREA OF THERMAL DISCHARGE FROM A COASTAL POWER STATION,

Modena Univ. (Italy). Inst. of Zoology.
R. Crema, and A. M. B. Pagliai.
Marine Pollution Bulletin, Vol 11, No 8, p 221-224, August, 1980. 5 Fig, 2 Tab, 13 Ref.

Descriptors: *Benthic fauna, *Thermal pollution, *Coastal waters, *Powerplants, Polychaetes, Population density, Aquatic populations, Mollusks, Crustaceans, Echinoderms, *Italy, Gulf of Follonica, Piombino.

The increasing use of seawater for cooling powerplants has raised many questions regarding the effects of heated effluents discharged from these facilities on the marine environment. The Piombino power station, located at Torre del Sale in the center of the Gulf of Follonica in Italy, currently consists of two sections, each producing 320 megawatts and using 22 cubic meters of seawater per second for cooling. With a temperature gradient of 9 degrees C across the plant, about 190 megacalorie of heat per second is discharged into the sea. A sampling plan was devised to allow comparison of the benthic communities of zones in proximity to the effluent outlet with those of zones unaffected by heated effluent. Polychaetes were the predominant taxa at all of the sampling sites, followed by mollusks and crustaceans. Typical infralittoral forms of polychaetes were found at the different depths. The numerical distribution of individuals per species was found to be log-normal in all samples. Previous studies have demonstrated that the log-normal model describes the distribution of a community in equilibrium and that the distribution deviates from the log-normal when the community is evolving towards a new equilibrium in response to pollution. The sampling method was found to be sensitive to the differences in commu-

nities related to depth, but showed no differences connected with proximity to the heated effluent. Comparison of these data with data collected at subsequent stages in the development of the full plant capacity is expected to provide some information on the amounts of heat the environment can receive without damage. EFFECTS OF EUTROPHICATION ON THE INTERTIDAL ECOLOGY OF LANGSTONE HARBOUR, U.K. AND PROPOSED CONTROL MEASURES,

Southern Water Authority, Worthing (England).
H. A. C. Montgomery, and P. G. Soulsby.
Water Science and Technology, Vol 13, No 7, p 287-294, 1981. 2 Fig, 3 Tab, 10 Ref.

Descriptors: *Wastewater pollution, *Water pollution effects, *Eutrophication, *Nutrients, *Harbors, Wastewater disposal, Wastewater discharge, Algal growth, Algal control, Benthic fauna, Biomass, Biological wastewater treatment, Nutrient removal, Nitrogen, Phosphorus, Prosphates, *Langstone Harbor, England.

Eutrophic conditions have developed in Langstone Harbor, a natural saline tidal basin off the South Coast of England. The disposal of about 40 megaliters/day of biologically treated sewage effluent into the north end of the harbor and an input of crude sewage on the ebb tide at the south end of the harbor have caused an overgrowth of the alga, Enteromorpha spp. on the intertidal mudflats. Manual and aerial photographs of the area were taken to estimate the coverage by the macroalgae from 1973 to 1979. Measurements of the algal biomass and benthic fauna were also taken. Algal biomass was significantly reduced in 1979 compared to 1978 data. The biomass of benthic from areas of high weed cover was significantly higher than that from areas with no weed cover. Seasonal studies of nutrient levels in harbor water are needed to clarify nitrate, nitrogen phosphate, and ammonia-nitrogen data. Preliminary samplings showed a clear pattern of dilution of these nutrients from the head to the mouth of the harbor. Plans to prevent further eutrophication include the adoption of nutrient removal measures at the sewage treatment works at the Budds Farm facility at the north end of the harbor. (Geiger-FRC)

EUTROPHICATION OF THE SALT VALLEY RESERVOIRS, 1968-1973. II. CHANGES IN PHYSICAL AND CHEMICAL PARAMETERS OF EUTROPHICATION,

Nebraska Univ.-Lincoln. School of Life Sciences.
G. L. Hergenrader.
Hydrobiologia, Vol 74, No 3, p 225-240, September 21, 1980. 16 Fig, 2 Tab, 31 Ref.

Descriptors: *Reservoirs, *Eutrophication, Water pollution effects, *Salt Valley, *Nebraska, Phytoplankton, Nutrients, Nitrogen compounds, Phosphates, Sulfates. Chlorides, Turbidity, Suspended solids, Alkalinity, Hardness, Calcium, Dissolved solids, Iron.

Eutrophication indicators were studied in four new, small, shallow, holomictic, eutrophic flood control reservoirs in Nebraska's Salt Valley. Weekly samples were taken during the summers of 1968-1973. Secchi disk transparencies decreased with time from 200 cm to 100 cm and were lowest in the oldest reservoir. (One reservoir with unusually high inorganic turbidity was not considered in this aspect.) As the reservoirs became more eutrophic over the study period, mean turbidity and mean suspended solids increased. Total alkalinity, total hardness, calcium, and phosphates (total unfiltered, total filtrate, and orthophosphate) all decreased during the 6 year period. These decreases were caused by intensive phytoplankton photosynthesis, which promoted more formation. Phosphorus coprecipitated with the marl. Parameters which were unreliable as eutrophication indicators were temperature, dissolved oxygen, dissolved solids, nitrate and ammonia nitrogen, and total iron. Although chloride and sulfate increased with progressive eutrophication, they were not considered reliable indicators. Chloride cannot be related to human activities. Sulfate data needs a longer observation period to determine the correlations. (Cassar-FRC)

BIOLOGICAL MONITORING PART VI - FUTURE NEEDS,

Virginia Inst. and State Univ., Blacksburg. Dept. of Biology.
J. Cairns Jr.
Water Research, Vol 15, No 8, p 941-952, August, 1981. 1 Fig, 55 Ref.

Descriptors: *Monitoring, *Chemical properties, *Toxicity, *Environmental effects, Risks, Ecosystems, Research priorities, Water pollution effects, *Biological samples.

System level tests rather than single species toxicity tests are urged as a more satisfactory way to determine the environmental effects of contaminants. The suggestion that at least multispecies tests should be required in biological monitoring studies is scientifically sound, but may be economically impractical. However, this type of test should be done for all chemicals that find their way into the environment. The appropriate mix of evidence required can be determined on a case-by-case basis using protocols developed for this purpose. When the cost of proceeding without an adequate risk assessment exceeds the cost of getting the necessary information through system tests and advanced monitoring, the cost of getting a more reliable estimate of risk seems more reasonable. New monitoring methods, particularly those geared to system and multispecies tests, are needed to perform monitoring methods on the scale that is necessary today. Numerous applications of these concepts in the field of water research are cited. Significant toxicity of polychlorinated biphenyls was determined in multispecies tests on aquatic invertebrates as contrasted to single species tests. Benefits of improved wastewater treatment systems and reduced industrial discharges have been demonstrated in the Wabash, Shenandoah, and South Rivers in the United States and the Thames and Clyde Rivers in England, among others. The importance of drainage basin management and determination of ecosystem assimilative capacity are illustrated. (Small-FRC)

PERSISTENT BLOOMS OF SURF DIATOMS ALONG THE PACIFIC COAST, U.S.A. I. PHYSICAL CHARACTERISTICS OF THE COASTAL REGION IN RELATION TO THE DISTRIBUTION AND ABUNDANCE OF THE SPECIES,

Washington Univ., Seattle. Dept. of Oceanography.
J. L. Garver, and J. Lewin.
Estuarine, Coastal and Shelf Science, Vol 12, p 217-229, 1981. 7 Fig, 2 Tab, 21 Ref.

Descriptors: *Algae, *Eutrophication *Population dynamics, *Coastal waters, Diatoms, Beaches, Chlorite, Montmorillonite, Seasonal variation, Physical properties, Pacific Ocean, Washington, Oregon.

A study was undertaken to establish the ranges of the two surf diatoms along the Pacific coast and to characterize the types of beaches and coastline associated with algal blooms. Water samples were taken every three weeks at Copalis Beach on the southern Washington coast and monthly at 12 beaches on the Oregon coastline. Only samples collected during daylight hours were included in the study. Chaetoceros armatum was present in surf samples at Copalis Beach and at all beaches on the Oregon coast with the exception of two at the southern end. A seasonal trend was not evident, but higher cell nubers were seen from October to January and during April and May. Asterionella socialis was present over the same geographical range as C. armatum. The abundance of A. socialis followed a more seasonal trend, with low numbers from June to September 1977, higher densities from October through May, and lower numbers again during the succeeding summer months. The northern beaches had high cell counts of both species, often exceeding 10,000 cells/ml. Five beaches per ml most of the time, but these blooms were not as persistent as those found along the northern group of beaches. Depressed numbers of both species remaining around 100 cells/ml were found at the next two beaches moving southward, and at the two southernmost beaches sampled the two surf species were absent. Discriminant analysis showed that the four groups could be completely separated by three discriminant functions composed of four physical variables: offshore bottom slope, percent chlorite, percent montmorillonite and beach length. (Baker-FRC)

STUDY ON THE SCARCITY OF RED TIDE IN THE EUTROPHICATED WATERS OF ARIAKE BAY I. DISSOLUTION OF PHOSPHATE ION FROM BOTTOM MUD BY HYDROGEN SULFIDE,

Kyushu Univ., Fukuoka (Japan). Lab. of Fisheries and Chemistry.
S. Ishio, and K. Kondo.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 46, No 8, p 977-989, August, 1980. 2 Fig, 9 Tab, 14 Ref.

Descriptors: *Eutrophication, *Red tide, *Nutrients, Water pollution effects, Fate of pollutants, Ariake Bay, Hakata Bay, *Japan, Dinoflagellates, Bottom sediments, Marine sediments, Bays, Phytoplankton, Phosphates, Nitrogen, Sulfides, Hydrogen sulfide, Benthos, Iron compounds, Tidal effects, Oxidation.

Although Araike Bay and Hakata Bay, Japan, are similarly eutrophied, red tide is a serious problem only in Hakata. Examination of the bottom muds of both bays showed similar levels of total C, total N, and total P, but differeaces in phosphate-P removal by 1% NaS solution were remarkable--236 plus or minus 227 mg per kg dry mud in Ariake and 80 plus or minus 50 mg per kg in Hakata. Average content of slufide-S in Hakata (0.654 g per kg dry mud) was 3.5 times that in Ariake (0.185 g per kg dry mud). The difference in sulfide concentrations is caused by a rapid tidal current and oxidizing conditions present in Ariake, but not in Hakata. In Hakata, soluble sulfides react with the available ferric phosphate to precipitate FeS and rapidly release phosphates into water, where this nutrient supports late summer dinoflagellate blooms. In Ariake, the FeP04 remains in the mud and is released more gradually. (Cassar-FRC)

EFFECTS OF POLLUTION ON HUMIC SUBSTANCES,

Department of Agriculture, Ottawa (Ontario). Chemistry and Biology Research Inst.
M. Schnitzer, and H. Kerndorff.
Journal of Environmental Science and Health, Part B, Vol 15, No 4, p 431-456, 1980. 6 Fig, 8 Tab, 12 Ref.

Descriptors: *Decomposing organic matter, *Water pollution effects, *Humic acids, Fulvic acids, Acidity, Chemical properties, Nitrogen, Sulfur, Sediments, Metals.

Humic acids and fulvic acids were isolated from unpolluted and polluted soils and sediments in an effort to assess the effects of industrial and environmental pollution on analytical characteristics of humic substances. The humic acids and fulvic acids were characterized by elemental and functional group analyses, by infrared spectrophotometry, by differential thermal analysis, and by analyses for 13 metals. Silicon was also determined in all samples. Soil and sediment samples were taken from six heavily polluted environments and from six pristine, isolated locations where little pollution was expected to occur. The polluted humic acids and fulvic acids contained more nitrogen and sulfur than unpolluted samples, while unpolluted samples contained more oxygen than polluted ones. Polluted samples were also richer than unpolluted samples in all of the 13 metals and in silicon. Increases in COO(-) groups, secondary non-cyclic amides, and possibly S03H groups were found in the polluted humic acids and fulvic acids. Differential thermal analyses showed that polluted humic materials were more thermostable than unpolluted humic acids and fulvic acids. The study results indicate that unusually high concentrations of nitrogen, sulfur, copper, chromium, zinc, and mercury in humic materials may be useful indicators of soil and sediment pollution. METHYLMERCURY CONTAMINATION OF AN EXPERIMENTAL TROPHIC CHAIN: IMPORTANCE OF THE PRIMARY PRODUCER-CONSUMER SYSTEM. (CONTAMINATION D'UNE CHAINE TROPHIQUE EXPERIMENTALE PAR LE METHYLMERCURE: IMPORTANCE DU SYSTEME 'PRODUCTEUR-CONSOMMATEUR PRIMAIRE'),

Bordeaux-1 Univ., Talence (France). Lab. d'Ecologie et Ecophysiologie Animales.
F. Robeyre, A. Boudou, and A. Delarche.
Environmental Pollution, Vol 24, No 3, p 193-206, March, 1981. 3 Fig, 3 Tab, 22 Ref.

Descriptors: *Mercury, *Bioaccumulation, *Algae, Toxicology, Food chains, Heavy metals, *Ecosystems, Water pollution.

Within the framework of methylmercury bioaccumulation and bioamplification along an experimental food chain with four links, the contamination procedure of the first two trophic levels, Chlorella vulgaris and Daphnia magna, is accurately defined. After developing the chosen methodology and the constraints inherent in each link, the main results showing the primary producer are presented from the toxicological point of view (inhibition rate of Chlorella growth). A sublethal concentration is defined for each species in the model and the dynamics of mercury fixation for Chlorella vulgaris and Daphnia magna are quantified at three temperatures over contamination periods of 24 hours and 96 hours, respectively. The study demonstrates the great fixation capacity of algae for mercury. Therefore, the first consumer level is essentially contaminated trophically. The study results underline the temperature factor effect on Daphnia magna accumulation processes; moulting, in relation to temperature, partly explaining the differences observed. The high values of the pollutant concentration factors relative to the water-Chlorella-Daphnia system confirm the importance of the inclusion of an autotrophic link at the base of an experimental trophic chain. On the other hand, the accuracy of the measurement shows the high level of reliability and reproducibility of the procedure chosen. (Carroll-FRC)

SESSILE ALGAE IN EUROPEAN MOUNTAIN STREAMS. I. THE ECOLOGICAL CHARACTERISTICS OF COMMUNITIES,

Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
B. Kawecka.
Acta Hydrobiologica, Vol 22, No 4, p 361-420, 1980. 16 Fig, 4 Tab, 79 Ref.

Descriptors: *Algae, *Stream degradation, *Mountains, Wastewater pollution, Reviews, Water pollution effects, Tourism, Wastewater disposal, Diatoms, Stream biota, Mountain streams, Europe.

The structure and ecology of sessile algae communities were investigated, and the changes in these characteristics caused by water pollution were determined. The investigation was carried out in pure high mountain streams which were polluted by sewage from tourist centers at various locations: Kebnekaise Mountains, Swedish Lapland; Tatra Mountains, Poland; Alps, Austria; Fagaras Mountains, Rumania; and Rila Mountains, Bulgaria. Seven algae communities were identified as being characteristic of unpolluted streams and three communities were found characteristic of streams polluted chiefly by domestic sewage. Algae developing in glacier streams had poor development of diatoms, while outflows from mountain lakes had abundant development of Cyanophyceae and lichens. A glacier stream below the inflow of domestic sewage in winter had a marked increase in diatoms. This may be due to increases in nitrate content. Domestic wastes influenced algae communities, whose structure was considerably changed as compared to communities of pure environments. (Small-FRC)

ECOLOGICAL EFFECTS OF MINE EFFLUENTS ON THE SOUTH ESK RIVER, NORTH-EASTERN TASMANIA. I. STUDY AREA AND BASIC WATER CHARACTERISTICS,

National Museum of Victoria, Melbourne (Australia).
R. H. Norris, P. S. Lake, and R. Swain.
Australian Journal of Marine and Freshwater Research, Vol 31, No 6, p 817-827, December, 1980. 8 Fig, 5 Tab, 30 Ref.

Descriptors: *Industrial wastes, *Rivers, *Tasmania, South Esk River, Mine wastes, Effluents, Acidity, Acid mine drainage, Cations, Phosphates, Chlorides, Nitrates, Seasonal variation, Rainfall, Temperature effects.

A study was made of the effects of mine effluents on the environment of the South Esk River in northeastern Tasmania. The study was conducted along 180 km of the river, over which distance it falls 20 meters, terminating at the Tamar estuary. The total catchment area is 8972 square kilometers, of which 7142 wquare kilometers is over the main sampling area. Land uses on the catchment include forestry, hydroelectric power generation and mixed farming. Effluents arise from mining operations in the area, which produce tin and tungsten. The dissolved oxygen concentrations of the river were at, or near, saturation levels. pH was slightly acid and was constant along the river course at any one time, indicating a reasonably well-buffered natural water. pH correlated positively with alkalinity and calcium, magnesium and sodium concentrations, all reaching their highest levels in the summer of 1975-76 after heavy rainfall during 1975. Dissolved carbon dioxide concentrations were generally above saturation levels. The major cation concentrations increased down-river. Low levels of phosphate, chloride, and nitrate indicate that the South Esk River is free of organic contamination by domestic and agricultural effluents. (Baker-FRC)

BACTERIAL UTILIZATION OF ALGAL EXTRACELLULAR PRODUCTS. I. THE KINETIC APPROACH,

Middlebury Coll., VT. Dept. of Biology.
W. H. Bell.
Limnology and Oceanography, Vol 25, No 6, p 1007-1020, November, 1980. 5 Fig, 1 Tab, 34 Ref.

Descriptors: *Algae, *Heterotrophic bacteria, *Kinetics, *Model studies, Bacteria, Experimental data, Eutrophication, Organic compounds, Water pollution effects, Skeletonema costatum, Chaetoceros affinis.

Equations for linear kinetic analysis of the utilization of algal extracellular products by bacteria were developed from a model for estimating heterotrophic potential originally proposed by Parsons and Strickland (1961) and subsequently modified. Laboratory studies using marine diatoms Skeletonema costatum and Chaetoceros affinis and a marine bacteria agreed with theoretical predictions below a substrate concentration of 400 micrograms C per liter. Thus changes in heterotrophic population size and concentration of extracellular products can be predicted. Deviations from linear predictions of the model may show the specificity of algal-bacterial interactions mediated by extracellular products. Application of the mixed substrate model may allow qualitative evaluation of the ecological significance of a phycosphere effect produced by algal blooms. (Cassar-FRC)

BACTERIAL UTILIZATION OF ALGAL EXTRACELLULAR PRODUCTS. 2. A KINETIC STUDY OF NATURAL POPULATIONS,

Middlebury Coll., VT. Dept. of Biology.
W. H. Bell, and E. Sakshaug
Limnology and Oceanography, Vol 25, No 6, p 1021-1033, November, 1980. 6 Fig, 1 Tab, 36 Ref.

Descriptors: *Algae, *Heterotrophic bacteria, *Kinetics, Eutrophication, Model studies, *Bacteria, Organic compounds, Water pollution effects, Skeletonema costatum, Chaetoceros affinis, *Norway.

The model for bacterial utilization of algal extracellular products was applied to a study of the uptake of C14-labeled extracellular products from Skeletonema costatum by native populations during an algal bloom in Trondheimsfjord, Norway, in 1977. Data obtained on 10 separate dates showed agreement with the linear predictions of the mixed substrate model. A 4-fold increase in bacterial activity was enough to prevent a large accumulation of extracellular products. During the later exponential phase of the bloom temporary inhibition of bacterial activity occurred. Chaetoceros affinis, a native alga not represented in the bloom, was used to evaluate the specificity of the algal-bacterial system. Results indicated that the bacterial population was not adapted to use C. affinis extracellular products during this bloom but was stimulated by the bloom to specifically use S. costatum extracellular products. PHYSICAL VARIABILITY AND PHYTOPLANKTON COMMUNITIES: II. PRIMARY PRODUCTIVITY BY PHYTOPLANKTON IN A PHYSICALLY VARIABLE ENVIRONMENT,

McMaster Univ., Hamilton (Ontario). Dept. of Biology.
G. P. Harris, G. D. Haffner, and B. B. Piccinin.
Archiv fur Hydrobiologie, Vol 88, No 4, p 393-425, June, 1980. 11 Fig, 3 Tab, 113 Ref.

Descriptors: *Phytoplankton, *Photosynthesis, *Temperature, Water pollution effects, Eutrophication, Aquatic life, *Lake Ontario.

This paper describes the week-by-week changes in the primary productivity of phytoplankton communities in Hamilton Harbor during the ice-free periods of 1975, 1976, and 1977. Measurements were made by the carbon-14 technique. Integral photosynthesis was lower than had been expected in a highly eutrophic water body. A significant

portion of the variability associated with the integral photosynthesis can be accounted for by the changes in the photosynthetic capacity of the phytoplankton. The variability in the photosynthetic saturation parameter correlated with thermal stability in the top 5 m of the water column. Significant self-shading by the phytoplankton was only recorded in 1975 and 1977. Physical changes in 1976 appeared to preclude any self-shading in that year. In this physically variable situation, the phytoplankton communities exhibited reduced photosynthetic capacity and reduced growth rates. Thus the total algal biomass in Hamilton Harbor did not reach levels predicted by phosphorus loading models. The usefulness of such data for management strategies is briefly discussed. (Baker-FRC)

CHEMICAL FLUX IN AN ACID-STRESSED STREAM,

Cornell Univ., Ithaca, NY. Section of Ecology and Systematics.
R. J. Hall, and G. E. Likens.
Nature, Vol 292, No 5821, p 329-331, July 23, 1981. 1 Fig, 1 Tab, 35 Ref.

Descriptors: *Acidic water, *Streams, *Ecological effects, Water pollution effects, Snowmelt, *Acid rain, Nutrients, Invertebrates, Aluminum, Organic matter, Aquatic life, Hydrogen ion concentration, Norris Brook, Hubbard Brook, *New Hampshire, Sulfuric acid.

The pH of a third-order stream, Norris Brook, New Hampshire, which normally is slightly acidic (pH 5.4-6.4) was maintained at pH 3.9-4.2 with sulfuric acid additions from April 18 to September 22, 1977. Effects were divided into acute (5-day, simulating spring snowmelt) and chronic (25-day, simulating chronic effects of acid rain). Invertebrates decreased 285% during the first five days and 58% at 25 days. This may have been a result of a decrease in collector organisms. Aluminum decreased 160% in five days and 86% after 25 days. Coarse particulate matter (leaves, tiny branches, etc.) decreased by 107% after five days but increased 18% after 25 days. Little or no change was seen in fine particulate organic matter, dissolved organic carbon, Ca, or N. Significant amounts of C, N, and P were lost from the ecosystem in the biologically bound form and in the particulate organic fraction. This has a detrimental effect on the acidified area and can be either beneficial or detrimental further downstream. (Cassar-FRC)

ACID PRECIPITATION--A NEW STUDY FROM NORWAY,

Imperial Coll. of Science and Technology, London (England). Centre for Environmental Technology.
J. N. B. Bell.
Nature (London), Vol 292, No 5820, p 199-200, July 16, 1981.

Descriptors: *Acid rain, *Norway, *Precipitation, *Ecological effects, Environmental effects, Aquatic life, Water pollution effects, Air pollution effects, Water pollution sources, *Lakes.

An accelerating decline in fish stocks which resulted in the extinction of fish populations in an area of 13,000 square kilometers and severe problems over another 20,000 square kilometers led to the establishment in 1972 of a major Norwegian research program (the SNSF project) into the biological effects of acid precipitation. The final report of this project, published in 1980, demonstrates that precipition in southern Scandinavia has become more acidic as a result of long-distance transport of air pollution. Nitrogen oxides are contributing an increasing proportion of the acidity. While routine analysis of precipitation samples provides estimates of the inputs of hydrogen ions, sulfur oxides, and nitrogen oxides, the importance of the dry deposition of gaseous and particulate sulfur and nitrogen compounds directly onto vegetation and soils is less well defined. Lake waters have become significantly more acidic in areas subject to acid precipitation. Acid precipitation also mobilizes aluminum in soils, which is a major factor in the destruction of fish populations. In southern Norway, where much of the precipitation falls as snow, particularly severe problems result from the flush of acid water into lakes during snow melt. Intensive studies failed to reveal any consistent effects of acid precipitation on forest productivity. Also, the effects of changes in land use on lake acidification are not fully understood. The SNSF project predicted that a reduction of at least 70 percent in hydrogen ions and sulfate concentrations in precipitation is necessary to restore lakes to their previous conditions. 5D. Waste Treatment Processes

ASSESSMENT OF EMERGING TECHNOLOGIES FOR METAL FINISHING POLLUTION CONTROL: THREE CASE STUDIES,

Centex Corp., Reston, VA.
P. Militello.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-244485, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-153, October, 1981. 4 p, 3 Fig, 3 Tab.

Descriptors: *Metal-finishing wastes, *Wastewater treatment, *Ozone, *Ion exchange, *Waste recovery, Industrial wastewater, Chromium, Cyanide, Metals, Suspended solids, Sludge drying.

Many novel approaches to treatment of electroplating wastewater have been evaluated based on available information under an earlier effort. The most promising of these were selected for further investigation to include sampling, performance verification, and cost analysis. The treatment methods studied included a system for treatment of electroplating wastes with ozone, a technique for chrome recovery by ion transfer, and a method of treating mixed wastestreams using ion exchange. The Ozodyne System at San Diego Plating exhibited reliable performance when operated on mixed wastewaters, reducing effluent concentrations of cyanide, metals, and total suspended soils to very low levels, often less than the limits of detectability. The vacuum filter employed as part of the system was able to dewater the resulting sludge to 75% solids content. The system should become highly competitive on a cost basis with conventional treatment as sludge disposal costs escalate. The ChromeNapper chrome recovery system at U.S. Plating exhibited reliable performance on a continuous unattended basis over several days of monitoring, successfully recovering and returning to the plating tank all chrome other than that plated on the workpiece. Economic comparison with conventional evaporative recovery shows the system to be highly attractive. Although the Rinse-Loop System at Chicago Modern Plating was plagued with operational difficulties from ancillary equipment, the basic ion exchange technology operated satisfactorily on the mixed wastewaters during those limited periods when it was possible to pay sufficient attention to maintenance. Descriptors: *Metal-finishing wastes, *Wastewater treatment, *Sulfide precipitation, Suspended solids, Cost analysis, Metals, Industrial wastes, Heavy metals, Chromium, Zinc, Process control.

The demonstration of a new patented sulfide precipitation process ('Sulfex') which removes heavy metals from metal finishing wastewaters, was performed to verify its operational practicability and performance quality. The study was performed at a carburetor manufacturing plant in Paris, Tennessee. 'Udylite' processes are used for chromate conversion coatings on aluminum and zinc carburetor castings before assembly. The sulfide precipitation system removes chromium and zinc from the plant's combined metal finishing process wastewater. It also removes suspended material such as precipitated aluminum, iron, and phosphates. Major steps in the system are: equalization and neutralization of untreated wastewater, precipitation of metals and sedimentation of suspended solids, polishing of settler effluent with dual media filtration, and final dewatering of settled sludge. All metals and suspended solids were removed to levels well below both the City of Paris sewer system limitations and the Tennessee guidelines for indirect discharge to sewer systems. Jar tests were demonstrated to be a valuable tool for maintaining good process control and economical operation. The chemical cost of sulfide precipitation has been found to be directly dependent upon the concentrations of combined zinc and hexavalent chromium present during the process. Sulfide precipitation was shown to be an economical as well as effective treatment for this type of wastewater. (Moore-SRC)

SOIL FILTRATION OF SEWAGE EFFLUENT OF A RURAL AREA,

Colorado State Univ., Fort Collins. Dept. of Agronomy.
B. R. Sabey, K. A. Barbarick, and N. A. Evans.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-238073, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-151, September, 1981. 4 p, 1 Fig, 1 Tab, 2 Ref.

Descriptors: *Wastewater irrigation, *Snow cover, *Weather, *Sprinkler irrigation, Soil filters, Municipal wastewater, Tile drainage, Groundwater pollution, Water quality, Wastewater treatment, Soil properties.

The effects of sprinkler-irrigated municipal sewage effluent and of surface tile drainage on a mountain meadow were investigated in the summer of 1977 and 1978. The treatments consisted of combinations of irrigations with effluent or ditch water at the rate of 7.5 cm/week and of drainage tiles or natural drainage. The drainage tiles were effective in lowering the groundwater elevations for about 85% and 10% of the season in 1977 and 1978, respectively. Higher plant concentrations of sodium and manganese in 1977 and plant yields and Mn concentration in 1978 were found in the plants harvested from the plots that were irrigated with sewage effluent. The influence of the effluent on groundwater quality and soil characteristics did not pose serious health or environmental problems. Another study to determine the feasibility of adding sewage effluent to mountain meadow land during winter was inititated in 1977 at Hayden, Colorado, near the summer effluent application site. It was determined that 7.5 cm/week of effluent could be added to the plots under an ice or snow cover if the soil profile was not frozen prior to ice and snow cover formation in the late fall and early winter. The size of ridge and furrow configuration did not influence any of the biological and chemical parameters measured in the study. The winter soil filtration system was effective in decreasing the concentrations of some chemical constituents including ammonium and potassium, as well as decreasing biochemical oxygen demand, chemical oxygen demand, and indicator organisms. The decrease in indicator organism numbers was not as great the second year of the study as it was the first. In general, the effluent distribution system worked reasonably well even in the winter as long as rapid drainage of the pipes was provided at the conclusion of the application period of each day. VIRUS INACTIVATION IN WASTEWATER EFFLUENTS BY CHLORINE, OZONE, AND ULTRAVIOLET LIGHT,

Radian Corp., Austin, TX.
R. A. Fluegge, T. G. Metcalf, and C. Wallis.

Available from the National Technical Information Service, Springfield, VA 22161 as PB81-208183, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-088, July 1981. 3 p. R804991

Descriptors: *Viruses, *Disinfection, *Chlorination, *Ozonation, *Ultraviolet radiation, *Wastewater treatment, Effluent, Coxsackie virus, Polio virus, Diurnal variation.

Virus levels before and after disinfection were studied in four full-scale wastewater treatment plants: two used chlorine as the disinfectant, one used ozone, and one used ultraviolet light. A second ozone study was conducted on a pilot scale at one of the treatment plants. Results for the viral content in wastewater effluents indicated no consistent correlation between virus concentrations and any of the traditionally measured indicators of pollution. No seasonal variation of virus concentration was detected in this four-season study. A diurnal variation, however, was noted in one of the plants during two separate samplings: one in December and one in July. Maximum virus concentrations occured in this effluent between 2:00 and 4:00 a.m. for each of these two sampling periods. All three types of polioviruses (1,2 and 3) were shown to be present in the effluents, with poliovirus 1 being the predominant virus type found in both the treated and treated plus disinfected effluents. Coxsackie A9, B1, B2, B3, B4, B5, and B6 were also isolated and identified. Except for coxsackie B5, all virus types were found in the treated as well as the treated plus disinfected effluent. Significantly lower virus isolation rates were encountered after disinfection. Experiments with pure strains and known quantities of attenuated viruses to determine recovery efficiencies indicated that variability in viral seed recovery data, although fairly small in a controlled laboratory environment, is more marked in a field situation. TWO-STAGE BIOLOGICAL TREATMENT OF COKE PLANT WASTEWATER,

Rexnord, Inc., Milwaukee, WI.
R. Osantowski, A. Geinopolos, J. Meverden, and J. Milanowski.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-240798, Price codes: A11 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-052, September, 1981. 4 p, 3 Fig, 1 Ref.

Descriptors: *Industrial wastewater, *Advanced wastewater treatment, *Biological wastewater treatment, *Activated sludge process, Filtration, Nitrogen removal, Activated carbon, Ammonia, Coke plant wastewater, *Byproducts, Wastewater treatment.

A pilot-plant study of the use of advanced waste treatment methods in upgrading metallurgical cokemaking wastewaters to Best Available Technology (BAT) levels was carried out using mobile treatment units. Three wastewater treatment trains were investigated. In the first treatment train, plant wastewater from downstream of the coke plant cooling tower was passed through a mixing tank, through the first-stage activated sludge system (carbonaceous removal), and then through the second-stage activated sludge system (nitrogen removal). The second treatment train consisted of the first treatment train (bio-oxidation) followed by activated carbon adsorption. The third treatment train included the components of the first treatment train followed by dual-media filtration. Abnormal operating conditions in the coke plant wastewater pretreatment system during the test resulted in ammonia levels as high as 2000 mg/l, making it necessary to dilute the second stage feed before nitrification could be achieved. Ammonia reductions of more than 97% were achieved in the second stage. Activated carbon and filtration effectively removed suspended solids, total organic carbon, color, and thiocyanate. (Moore-SRC)

LABORATORY STUDIES OF PRIORITY POLLUTANT TREATABILITY,

Walk, Haydel and Associates, Inc., New Orleans, LA.
J. K. Smith, R. J. Planchet, E. J. Westbrook, and F. J. Zak.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-231235, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-129. September, 1981. 4 Fig, 2 Tab, 2 Ref.

Descriptors: *Industrial wastewater, *Wastewater treatment, *Adsorption, *Steam stripping, Benzenes, Phenols, Chlorinated hydrocarbons, Petroleum industry, Chemical industry, *Cost analysis, Aniline, Priorities.

A wastewater grab sample from a typical medium sized petrochemical manufacturing complex was used for laboratory bench scale treatment tests on five priority pollutants present at significant concentrations. The study focused on carbon adsorption, resin adsorption and steam stripping technologies and developed order-of-magnitude cost relationships for each technology. The results indicate high removal efficiency for the priority pollutants nitrobenzene, p-dichlorobenzene, chlorobenzene, phenol and dinitrotoluene by both carbon adsorption and resin adsorption. Steam stripping was not effective under the test conditions for removal of phenol or dinitrotoluene. The steam stripping data also indicated that removal of the non-conventional pollutant aniline was ineffective. Operating costs for treating streams similar to the stream tested are estimated to be on the order of $2 to $3 per 1000 l for flows of about 1130 l/min. Cost effectiveness may favor use of carbon adsorption over resin adsorption and combination systems appear to offer no economic advantage at pollutant levels present in the sample. (Moore-SRC)

FEASIBILITY STUDY OF OPEN TANK OXYGEN ACTIVATED SLUDGE WASTEWATER TREATMENT,

FMC Corporation, Englewood, CO
K. R. Rakness.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-213274, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-095, July, 1981. 7 p, 1 Fig, 5 Tab.

Descriptors: *Oxygenation, *Activated sludge process, *Wastewater treatment, Municipal wastewater, Effluent, Biochemical oxygen demand, Sludge.

To date, there is one known open tank high purity oxygen activated sludge system on the market, the MAROX system. The system uses a unique bubble shear method for dissolution of pure oxygen to the mixed liquor. The pilot plant used consisted of one oxygenation basin and two clarifiers capable of treating 151 L/min. The system treated primary effluent from a municipal wastewater treatment facility. The influent flow rate was adjusted to attain average aeration reactor detention times ranging from 0.94 to 3.3 hr. The pilot plant operation was conducted in two phases. Treatment performance during both phases was excellent. Final effluent BOD5 concentrations and secondary BOD5 removals averaged less than 20 mg/L and greater than 90%, respectively. No degradation in process removal efficiency occurred, even at organic loadings as high as 1.23 kg BOD5 applied/day/kg mixed liquor suspended solids (MLSS) and volumetric loadings as high as 4.07 kg BOD5 applied/day/cu m of reactor capacity. Better effluent quality was attained by operating at return flow/influent flow ratios between 50 and 60 as opposed to ratios between 30 and 40. No significant nitrification occurred during the test program. Analysis of operations indicated that somewhat less sludge was produced with the oxygen system when compared with typical air sludge production. (Moore-SRC)
W82-03032

PHYSICAL/CHEMICAL TREATMENT OF COKE PLANT WASTEWATER,

Rexnord, Inc., Milwaukee, WI.
R. Osantowski, A. Geinopolos, and G. Rollinger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-206021, Price codes: A10 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-053, July, 1981. 2 p.

Descriptors: *Industrial wastewater, *Wastewater treatment, *Physicochemical treatment, Chlorination, Filtration, Dechlorination, Activated carbon, Suspended solids, Organic compounds, *Coke plant wastewater.

Selected advanced waste treatment technologies for treating metallurgical cokemaking wastewaters to Best Available Technology (BAT) levels were investigated in a pilot-plant study. Mobile treatment units, operable at a flow rate of 19 l/min, were used. Two physical/chemical treatment trains were studied: alkaline-chlorination/filtration/activated-carbon, and alkaline-chlorination/sodium-bisulfite-dechlorination/filtration. Chlorination was effective in consistently reducing pollutant concentrations to below BAT levels, except for total cyanide. Filtration provided effective polishing of the alkaline chlorinated coke plant wastewater, removing 71% of the influent suspended solids. Suspended solids removal could be increased to 93% of the incoming total chlorine, while sodium bisulfite provided 100% chlorine removal at a bisulfite:chlorine ratio of 2:1. The treatment trains created several volatile organic priority pollutants. Train 1 technologies removed 73% of the volatile organic priority pollutants to non-detectable limits; train 2 technologies were effective in treating only 17% of incoming volatile organic toxics to non-detectable levels. Semivolatile organics were all effectively reduced for train 1. Train 2 also reduced all semivolatile organics to less than 100 micro g/l except for naphthalene. (Moore-SRC)

TEXTILE WARP SIZE RECLAMATION USING THERMAL PRECIPITATION,

Auburn Univ., AL.
W. S. Perkins, R. P. Walker, and L. J. Hirth.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-129041, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-80-209, July, 1981. 4 p, 1 Fig.

Descriptors: Textiles, *Recycling, *Water pollution control, *Wastewater renovation, Cost analysis, Waste recovery, Industrial wastewater, Water reuse, Size material removal, *Textile mill wastes.

Virtually all textile yarns which are to be woven into the warp in a fabric are coated with a protective material, called size, during the slashing process, in order to improve the performance of the yarn in the weaving process. In most cases the size material is removed from the woven fabric in the finishing plant. A process to recover and recycle the warp size has the potential to lower the BOD and COD of textile finishing plant effluents more than any other single change in textile processing. A novel method for reclaiming size is based on precipitation of the size material by heating the desize washwater. The method uses hydroxypropyl cellulose (HPC) or hydroxypropyl methylcellulose (HPMC) which are soluble in cool water but insoluble in warm water. Water used for desizing and subsequently separated from the HPC in a recovery system is suitable for reuse in desizing. Strength and elongation of yarns sized with virgin HPC and with reclaimed HPC were not significantly different from those of yarns sized with conventional size. Weaving of HPC-sized yarns in the laboratory was successful. The capital investment for reclaiming HPC using thermal precipitation is much lower than for recovering polyvinyl alcohol size using ultrafiltration. Size reclamation is considered to be an economical approach to chemical and water conservation and will reduce pollution load. (Moore-SRC)

REMOVAL OF HEAVY METALS AND SUSPENDED SOLIDS FROM BATTERY WASTEWATERS: APPLICATION OF HYDROPERM CROSS-FLOW MICROFILTRATION,

Hydronautics, Inc., Laurel, MD.
N. I. Shapiro, H. L. Liu, J. Baramski, and D. Kurzweg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-234833, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-147, September, 1981. 5 p, 3 Fig.

Descriptors: *Heavy metals, *Suspended solids, *Wastewater treatment, *Filtration, *Industrial wastewater, Lead, Neutralization, Lime, Battery wastewater.

The microfiltration system is a treatment process which employs a physical principle of treatment for suspended solids removal after chemical precipitation. The principal element of the system is a thermoplastic tubular filter constructed with a controlled porosity in the micron-size range. Relatively low feed pressures are employed. Laboratory and full-scale field demonstrations were conducted to demonstrate the applicability of the microfiltration system to lead-acid battery production wastewaters. The waste from the battery manufacturing facility is a mixture of sulfuric acid from occasional dumping of open-tank formation of the anode and cathode battery plates, rinse water from the plate washing facilities, and floor drains from throughout the plant. The combined total daily waste production is approximately 75,000 1/day. The waste acid and rinse water mixture is neutralized with high calcium lime to convert the soluble metals to a suspended hydroxide form. Suspended solids in the feed which exceeded 150,000 ppm were typically reduced to 3 ppm in the permeate. Lead in the feed in the range of several hundred parts per million was typically reduced to 0.02-0.1 ppm. Other toxic heavy metals were removed with comparable effectiveness. (Moore-SRC)

FINE COAL-REFUSE SLURRY DEWATERING,

Bureau of Mines, Spokane, WA. Spokane Research Center.
R. R. Backer, and R. A. Busch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-160268, Price codes: A02 in paper copy, A01 in microfiche. Bureau of Mines Report of Investigation 8581, 1981. 21 p, 11 Fig, 7 Tab.

Descriptors: *Slurries, *Dewatering, *Mine wastes, *Coal, Flocculation, *Wastewater treatment, Polymers, Drains, Lime.

Under normal operating conditions and with state-of-the-art decant construction, current impoundments never achieve adequate dewatering and stabilization of fine coal-refuse slurry. Bench-scale and field tests were carried out to evaluate dewatering using chemicals and various types and combinations of drains in natural earth impoundments. About 40 lb of lime and 2 lb of polymer per ton of dry solids were mixed with the underflow from preparation-plant thickener. Clear, free water was immediately liberated from the slurry. The percent solids by weight of the slurry increased from about 17 to 30 immediately, and after 5 days increased to 45%. In contrast, untreated slurry took weeks to settle, and the surface water remained turbid. The low permeability of the flocculated slurry precludes rapid dewatering without some type of drainage system and supplemental surface decanting to remove the clear water at a rate that would permit continuous operation. Vertical fabric drains seemed to be a little more effective than vertical sand drains: on the basis of comparative permeabilities, it is assumed that their advantage was derived from a larger surface-area contact with the slurry. To insure reclamation of water and prevent possible ground-water contamination it would be advisable to have an impervious soil base with a bottom drain of sand or bottom ash. (Moore-SRC)

RESTORING GROUND WATER QUALITY FOLLOWING IN SITU LEACHING,

Bureau of Mines, Twin Cities, MN. Twin Cities Research Center.
D. R. Tweeton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-104753, Price codes: A06 in paper copy, A01 in microfiche. In: In Situ Mining Research, Proceedings: Bureau of Mines Technology Transfer Seminar, Denver, CO, August 5, 1981, Bureau of Mines Information Circular 8852, 1981. p 27-37, 9 Tab, 2 Ref.

Descriptors: *Groundwater pollution, *Water pollution control, *Wastewater treatment, *Leaching, Sludge, Reverse osmosis, Injection wells, Evaporation ponds, Uranium.

The waste solution from in situ uranium leaching and from postleaching restoration can be disposed of in either a deep disposal well or an evaporation pond. Generally, deep disposal wells have been used in Texas and evaporation ponds in Wyoming. Injection of waste through a deep well into a zone that does not contain useful water offers the advantage that the waste is completely removed from the biosphere. Deep well disposal is limited to waste solutions that will not plug the injection zone by the precipitation of solids in reactions between the solution and the matrix of the host aquifer. An important disadvantage of solar evaporation ponds is that as evaporation occurs, a sludge remains and there are stringent regulations governing the disposal of the sludge. The waste stream from leaching or from restoration can be treated to produce two streams: purified water, and a concentrated brine. The purified water can be reused, thereby reducing the total consumption of water, and the disposal system does not require as large a capacity. The surface treatment technique that has been used for in situ leaching wastes is reverse osmosis. Other treatment methods that are potentially useful are electrodialysis, distillation, ion exchange, foam separation, and freeze separation. Ground water restoration appears to be a bigger problem than was previously thought. Field testing has shown that complete restoration, as defined by State regulatory agencies, has not been attained with reasonable degrees of flushing at any of the sites studied. (Moore-SRC)

FULL-SCALE EVALUATION OF HIGH RATE SCREENING DEVICES FOR TREATMENT OF SANITARY SEWAGE BY-PASS FLOW,

Ontario Ministry of the Environment, Toronto.
H. Kronis, and F. Tonelli.
1980. 145 p, Fig, Tab, 11 Ref, Append.

Descriptors: *Suspended solids, *Nutrients, *Water quality, *Sewage, Centrifugal wastewater concentrator, BOD5, Hydrasieve, Rotostrainer, Primary treatment, Secondary treatment, Urban drainage, Canada, *Ontario, *Wastewater treatment.

The performance of four fine-mesh high-rate screening devices treating combined sewage under wet and dry weather conditions were evaluated. The units tested were: a 1.5-m (60-inch) diameter Centrifugal Wastewater Concentrator (CWC) with 105-micrometre apertures; a 1.5-m (60-inch) long rotating horizontal drum screen (Rotostrainer) with 500-micrometre apertures; and two stationary inclined screens, a 0.6-m (24-inch) wide DSM and a 1.8-m (72-inch) wide Hydrasieve, having 305 and 762-micrometre apertures, respectively. The study was conducted during 1974/75 at the Belleville, Ontario, Water Pollution Control Plant, where influent sewage is subject to substantial infiltration, dilution, and flow peaking during wet weather. Hydraulic capacity and pollutant removal depended largely on the type of screening device, the screen aperture size, and the availability of an effective backwash system. Hydraulic capacities were between 0.78 to 2.4 cu m/sq m per min (16 and 50 gal/min per sq ft). Typical mean pollutant removals obtained during storm events with first flush conditions were between 5 and 32 percent for suspended solids, 5 and 24 percent for BOD5, and 23 and 79 percent for settleable solids. In general, pollutant reductions were substantially less in dry weather. Operating costs were estimated to be between 0.13 and 4.2 cents per cubic metre (0.6 and 19 cents per 1000 gallons) treated depending on, among other factors, installed capacity, the number of hours of operation, and the device evaluated. It was concluded that screening had potential for the reduction of pollutants in combined sewer flows. (WATDOC)

MASS PRODUCTION OF FRESHWATER ROTIFERS ON LIQUID WASTES I. THE INFLUENCE OF SOME ENVIRONMENTAL FACTORS ON POPULATION GROWTH OF BRACHIONUS RUBENS EHRENBERG 1838,

Kernforschungsanlage, Juelich (Germany, F.R.) Inst. fuer Biotechnologie III.
M. Schluter, and J. Groeneweg.
Aquaculture, Vol 25, No 1, p 17-24, July, 1981. 4 Fig, 10 Ref.

Descriptors: *Rotifers, *Animal wastes, *Aquaculture, *Wastewater treatment, Ponds, Algae, Manure, *Farm wastes, Nitrites, Dissolved oxygen, Oxygen, Growth rates, Hydrogen ion concentration.

The effects of environmental factors on the rotifer Brachionus rubens were studied for two reasons: to control the undesirable growth of rotifers in an algal pond for treatment of pig manure and to test the possibility of continuous mass production of rotifers in algal pond effluents. Results indicate that rotifers tolerated oxygen concentrations as low as 1.5 mg per liter for long periods. Rotifers adapted to nitrites had population growth rates of 70-90% of controls at nitrite concentrations of 15 mg per liter or less. These growth rates declined steadily to 15% at 30 mg per liter. Addition of sodium chloride showed that some animals survived at levels of 4 g per liter. Growth was greater than 85% at 1 mg per liter NaCl or less. Rotifers did not survive at pH < 4.5 or > 9.5. Growth reached a peak at pH 7. Rotifer growth could be controlled by stopping the wastewater inflow to the pond on sunny summer days, when pH levels of 11 are possible. Conversely, pH must be maintained at 6-8 for optimum rotifer growth. (Cassar-FRC)

USE OF A FRACTIONAL DESIGN TO EVALUATE INTERACTIONS OF ENVIRONMENTAL FACTORS AFFECTING BIODEGRADATION RATES,

Wyoming Univ., Laramie. Dept. of Zoology and Physiology.
T. E. Fannin, M. D. Marcus, D. A. Anderson, and H. L. Bergman.
Applied and Environmental Microbiology, Vol 42, No 6, p 936-943, December, 1981. 4 Fig, 4 Tab, 19 Ref.

Descriptors: *Phenol, *Biodegradation, *Factor analysis, Degradation, *Wastewater treatment, Experimental design.

Fractional factorial design was used to evaluate the main and interactive effects of six environmental factors on biodegradation of phenol. This procedure reduced the number of shake-flask experiments to 81, compared with the 324 necessary with conventional factorial designs. The six factors investigated were: (1) amount of phenol substrate, (2) amount of bacterial inoculum, (3) filtration of inoculum, (4) type of basal salts medium, (5) initial pH of basal salts medium, and (6) flask closure. Factors (1), (2), and (4) had significant single effects on biodegradation. Increasing phenol concentrations in the substrate decreased the maximum degradation rate. Increasing the amount of bacterial inoculum increased the maximum degradation rate. The highest maximum degradation rates were observed in R and V medium, used for determining phenol-degradation bacteria. Interactive effects were found for factors (2) and (3) and for factors (2) and (5). (Cassar-FRC)

RECOVERY OF INDIGENOUS ENTEROVIRUSES FROM RAW AND DIGESTED SEWAGE SLUDGES,

Surrey Univ., Guildford (England). Dept. of Microbiology.
M. R. Goddard, J. Bates, and M. Butler.
Applied and Environmental Microbiology, Vol 42, No 6, p 1023-1028, December, 1981. 4 Fig, 2 Tab, 19 Ref.

Descriptors: *Viruses, *Sludge digestion, Digestion, Fate of pollutants, Sludge disposal, Mesophilic digestion, Thermophilic digestion, Anaerobic digestion, *Raw wastewater.

Removal of enteroviruses by three types of raw sewage sludge digestion was determined. Treatments were: (A) 30-35 days of anaerobic-mesophilic digestion, followed by 30 days consolidation; (B) 24 hours consolidation, 30-35 days anaerobic-mesophilic digestion, followed by 30-40 days of consolidation; (C) 25-30 days of anaerobic-mesophilic digestion followed by 3-4 years of drying in beds; and (D) a pilot plant thermophilic-aerobic digestion treatment. The pilot plant was most effective and fastest in reducing titers of infectious viruses. Reductions of viruses after consolidation (75th day) were (A), 88.5%, and (B), 84.2%. Little reduction in virus titer took place in Treatment (C) by the 35th day, when sludge was applied to land. Mesophilic digestion alone did not reliably reduce virus titers, possibly as a result of inadequate mixing during daily sludge additions. However, the consolidation process decreased viruses to a greater extent. (Cassar-FRC)

THE EFFECT OF NI(II) ON NITRIFICATION IN THE ACTIVATED SLUDGE PROCESS,

Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
P. G. Trahern, W. R. Knocke, and J. H. Sherrard.
AIChE Symposium Series, Vol 77, No 209, p 171-176, 1981. 5 Fig, 2 Tab, 12 Ref.

Descriptors: *Nitrification, Activated sludge, Sludge, *Activated sludge process, *Wastewater treatment, *Nickel, Heavy metals, Biological treatment.

The study was accomplished by operating continuous flow, laboratory scale activated sludge units over a wide range of process operating conditions. The units were fed a soluble, reproducible wastewater in which the COD:TKN ratio was varied and the concentration of Ni(II) was varied. Data were collected under steady state conditions and were analyzed to assess the effect of Ni(II) on the degree of nitrification, COD removal efficiency, microbial yield coefficient and microbial maintenance coefficient. Nitrification was inhibited at an influent Ni(II) of 1.0 mg/l, a COD:TKN ratio of 3.7:1 and influent COD of 400 mg/l. Efficiency of organic removal as measured by the COD test was not affected by the presence of an influent Ni(II) concentration of 1 mg/l. This indicates that the threshold toxicity concentration is higher than 1 mg/l. No effect on nitrification or COD removal efficiency was noted with an influent Ni(II) concentration of 0.5 mg/l for substrates containing COD:TKN ratios between 2.4:1 and 7.3:1 with an influent COD of 400 mg/l. This observation, coupled with that of the prior conclusion, indicates that the nitrification threshold toxicity concentration proceeded at a very high efficiency at pH values as low as 4.9. The presence of Ni(II) was found to influence the values of the biokinetic coefficients. (Baker-FRC)

TREATMENT OF METAL CONTAINING WASTEWATER WITH CALCIUM SULFIDE,

General Electric Co., Schenectady, NY.
B. M. Kim.
AIChE Symposium Series, Vol 77, No 209, p 39-48, 1981. 5 Fig, 5 Tab, 11 Ref.

Descriptors: *Wastewater treatment, *Heavy metals, Sulfides, Precipitation, Industrial wastes, *Calcium sulfide.

This paper discusses sulfide precipitation methods, process development, results of treatability studies using wastewater samples, and examples of process applications in wastewater treatment plants. Sulfide precipitation is very effective for the removal of heavy metals such as cadmium, copper, lead, silver and zinc. The method works in the presence of chelating agents and removes metals to extremely low concentrations. The calcium sulfide slurries, prepared by reacting lime with hydrogen sulfide or sodium hydrosulfide, are effective sulfide sources. The addition of calcium sulfide can be controlled simply in most cases by measuring the pH. The processes employing such techniques have been demonstrated in bench scale experiments using wastewater samples. The two stage process may be employed when the wastewater contains a large amount of iron and nontoxic suspended solids. The major advantage of the process is the significant reduction achieved in toxic sludge volume when a large amount of nontoxic materials is present in the wastewater. The two stage process requires a capital cost higher then the single stage process. Since the solid/liquid separation in the first stage is not as critical as the second stage, a less expensive clarification system may be employed in the first stage. (Baker-FRC)

TREATMENT OF COOLING TOWER BLOWDOWN,

Bechtel Corp., San Francisco, CA.
A. N. Rogers, M. C. Weekes, S. C. May, and E. H. Houle.
AIChE Symposium Series, Vol 77, No 209, p 239-248, 1981. 3 Fig, 5 Tab, 9 Ref.

Descriptors: *Cooling water, *Reverse osmosis, *Vapor compression distillation, *Wastewater treatment, Dissolved solids, Crystallization, Evaporation, Ponds, Scaling, *Powerplants, Distillation, Steam, Surfactants, Brines.

Three processes for treatment of powerplant cooling tower blowdown are described and compared: reverse osmosis, vapor compression, and vertical tube evaporation. Dissolved salts are concentrated and wasted to ponds. In reverse osmosis the feed must be pretreated to reduce the concentration of scale-formers. This involves addition of sodium carbonate-lime slurry for precipitation of salts, Cl for controlling bacterial growth, acid for pH adjustment, sodium bisulfite for dechlorination, and sodium hexametaphosphate to obstruct the growth of scale crystals. About 75% of the original feed is recovered as usable water, containing 6-7% of the initial salt concentration. Vapor compression evaporation uses a vertical tube evaporator in which the liquid descends as a thin film on the inside of tubes. Compressed steam in contact with the outside of these tubes evaporates the feed water. Brine is recycled to the top for further evaporation. A vapor compressor withdraws the vapor generated and condenses it on the outside of the evaporation tubes. The process is highly energy-effective. The vertical tube foaming evaporator, not yet in commercial operation, consists of a conventional vertical tube evaporator followed by a smaller evaporator to concentrate the brine to the crystallizing stage. The small amount of surfactant added to the feed reduces scale formation, lowers hydrostatic losses, and improves heat transfer. No process was superior to the other two in all respects--energy use, product water quality, operating costs, ponding requirements, sensitivity to upsets, or ease of construction. (Cassar-FRC)

TREATABILITY OF TOXIC WASTEWATER POLLUTANTS BY SOLVENT EXTRACTION,

Environmental Protection Agency, Washington, DC.
S. T. Hwang.
AIChE Symposium Series, Vol 77, No 209, p 304-315, 1981. 1 Tab, 14 Ref.

Descriptors: *Organic compounds, *Solvent extraction, *Distribution coefficients, *Wastewater treatment, Chlorinated hydrocarbons, Pesticides, Amines, Phthalates, Aromatic compounds, Phenols, Polynuclear aromatic hydrocarbons, Activated carbon, Reviews, Toxins.

A review of the literature on solvent extraction of organic priority pollutants from wastewater is presented. This method can remove up to 99.9% of some organic toxic pollutants which are difficult to remove by steam or inert gas stripping or activated carbon adsorption. Capital expenditures for a 400 gpm solvent extraction system are given as $2 million. Part of this cost may be offset by recovery of marketable organic compounds. Tables give distribution coefficients for 89 organic pollutants in the following solvents: tricresyl phosphate, undecane, methyl isobutyl ketone, tridecane, benzene, isobutylene, isobutane, n-butyl acetate, isobutyl acetate, diisopropyl ether, octanol, cumene, mesityl oxide, methyl ethyl ketone, ethyl acetate, ethyl ether, ethyl benzene, n-hexanol, EDC, toluene, xylene, and n-hexane. The pollutants include chlorinated hydrocarbons, phenols, aromatic compounds, polycyclic aromatic compounds, amines, phthalates, and pesticides. (Cassar-FRC)

FREEZE CRYSTALLIZATION APPLICATIONS FOR WASTEWATER RECYCLE AND REUSE,

Heist Engineering Corp., Wilmington, NC.
J. A. Heist.
AIChE Symposium Series, Vol 77, No 209, p 259-272, 1981. 4 Fig, 6 Tab, 29 Ref.

Descriptors: *Industrial wastewater, *Crystallization, *Water reuse, *Wastewater treatment, Freeze crystallization, Chemical wastewater, Solubility, Cooling water, Acids, Metal-finishing wastes, Organic compounds, Separation techniques.

Industrial wastewater treatment by freeze crystallization has many advantages: no pretreatment, minimal corrosion of equipment, high level of water recovery, enhanced byproduct recovery, small volume of final waste, and thermodynamics favorable to energy savings. The versatile process may be adapted to many conditions. The basic process steps are: crystallization by direct or indirect contact with the refrigerant, crystal separation (often in a wash column), melting for energy conservation, and heat recovery from the melted product for additional energy savings. Steps are described for adapting freeze crystallization to a new application: determining solid-liquid equilibria, developing flow diagrams and mass and energy balances, and analyzing economic feasibility. This planning process is illustrated for freeze crystallization treatment of wastewaters from three applications: cooling tower blowdown, pickle liquor for preparing metal surfaces, and wash waters from terephthalic acid manufacture. SLUDGE MANAGEMENT PROCESS INTEGRATION,

Cornell Univ., Ithaca, NY.
R. I. Dick.
AIChE Symposium Series, Vol 77, No 209, p 214-219, 1981. 5 Fig, 4 Ref.

Descriptors: *Sludge disposal, *Economic aspects, *Wastewater treatment, Sludge thickening, Sludge drying, Sludge, Activated sludge, Waste management.

Means for rationally integrating processes for sludge management are considered. Categories of processes include those for thickening, conditioning, dewatering, stabilizing, inactivating, combusting, reusing, storing, transporting, and disposing of sludge. A variety of different individual processes can be used within each category. Several advantages can be gained in designing a management scheme by considering important interactions between sludge management processes and designing and operating sludge management facilities to minimize adverse interactions and maximize favorable interactions to achieve overall least cost. The physical properties of sludges are principal factors influencing the cost of sludge management. Given the properties of sludge as they are currently produced, substantial attention to physical properties is warranted in process design, and research is needed on means for controlling and improving the physical properties of sludge at its source and for altering physical properties following sludge

production. Specific findings suggest that gravity thickeners should be built larger than is generally the practice, whereas the optimum size of anaerobic digesters is usually the minimum required for operational stability. Sludge irradiation results in improvement in sludge dewatering properties, and thus a reduction in the net costs. (Baker-FRC)

BIOLOGICAL NITROGEN CONTROL OF INDUSTRIAL WASTEWATER,

Dorr-Oliver Inc., Stamford, CT.
P. M. Sutton, and T. R. Bridle.
AIChE Symposium Series, Vol 77, No 209, p 177-185, 1981. 9 Fig, 3 Tab, 15 Ref.

Descriptors: *Wastewater treatment, *Denitrification, *Industrial wastewater, Nitrogen, Nitrification, Carbon, Sludge, Activated sludge process, Coke plant wastewater, Organic compounds, Steel industry, Plastics wastewater.

Results are presented from studies undertaken as part of the Canadian federal government regulation development activities for the organic chemical industry and the iron and steel industry involving the application of the pre-denitrification-nitrification process configuration. This configuration will be the most economical alternative for the biological treatment of industrial wastewaters such as nylon intermediates wastewater containing high concentrations of organic carbon and inorganic nitrogen. Organic carbon and nitrate reduction are accomplished in an anoxic first stage reactor, with the organics present in the wastewater providing the carbon and energy for denitrification. The conversion of ammonia to nitrate, or nitrification, and oxidation of any biodegradable organics not removed in the first stage, is accomplished in the aerobic second stage. In demonstration studies the single sludge pre-denitrification-nitrification system was able to achieve complete nitrification and denitrification of coke plant wastewater from Dominion Foundries and Steel Limited, provided dilution is practiced or powdered activated carbon is added at 33 to 50 mg/liter. The minimum aerobic solids retention time required to achieve complete nitrification of diluted wastewater at 22 to 24 degrees C was 22 days. In the treatment of high strength wastewater, Nitrobacter inhibition can be overcome by addition of 50 mg/liter of PAC to the feed. Dilution of the wastewater did not eliminate Nitrobacter inhibition. The organic carbon present in the wastewater can be used as the carbon and energy source for the denitrification reaction. No supplemental organic carbon is needed if the feed FOC/TN ratio is greater than 3.5. (Baker-FRC)

NITRIFICATION USING THE ROTATING BIOLOGICAL CONTACTOR,

Army Environmental Hygiene Agency, Aberdeen Proving Ground, MD.
R. D. Miller, J. A. Hitdlebaugh, C. I. Noss, and E. D. Smith.
AIChE Symposium Series, Vol 77, No 209, p 186-195, 1981. 7 Fig, 33 Ref.

Descriptors: *Nitrification, *Wastewater treatment, Acidity, Temperature effects, Biological oxygen demand, Oxidation, Rotating biological contactor.

This paper reports on nitrification using the rotating biological contactor (RBC) process based on both pilot and full scale experiences with domestic wastewaters. It offers a literature review and a discussion of the nitrification reaction. Selection of design criteria is detailed, and scale-up problems are outlined. The importance of environmental conditions such as pH and temperature as well as other variables is discussed for treatment plant design relative to any wastewater. A list of specific conclusions regarding the RBC process for nitrification is presented. The RBC process can be an effective design for combined secondary treatment and nitrification when the following facts are considered. First, pH levels influence the rate of nitrification and the location where it begins. Adjusting chemical feed to increase pH levels to at least 7.0 in all RBC stages increases the rate of nitrification and decreases RBC surface area requirements. This produces more effective design and consistent ammonia removal. Wastewater temperature affects both secondary treatment and nitrification within RBC stages. Nitrification rates are more sensitive to low temperatures than organic removal rates. Dissolved oxygen, which may be a limiting condition, can be easily corrected by supplemental aeration during organic removal. Filtration after the RBC process will be needed to meet total BOD limits of 10 mg/liter or less. (Baker-FRC)

PREDICTION OF THE FATE OF ORGANIC COMPOUNDS IN BIOLOGICAL WASTEWATER TREATMENT SYSTEMS,

Purdue Univ., Lafayette, IN. School of Civil Engineering.
R. F. Wukasch, C. P. L. Grady Jr., and E. J. Kirsch.
AIChE Symposium Series, Vol 77, No 209, p 137-143, 1981. 11 Fig, 4 Ref.

Descriptors: *Wastewater treatment, *Organic compounds, *Biological wastewater treatment, Model studies, Municipal wastewater, Degradation, Sludge, Toxicity, Testing procedures.

A testing protocol was developed and evaluated which would determine and predict the fate of specific organic compounds in conventional biological wastewater treatment systems. This protocol was designed to determine the toxicity to aerobic biological systems and anaerobic sludge digestion systems of the specific compound; to quantitate the adsorption and stripping losses of the compound; to develop kinetic information allowing prediction of effluent quality as a function of the solids retention time of the biological treatment system; and to estimate the extent of biodegradation of the compound. A description is offered of the protocol using pentachlorophenol as the test compound. The protocol focuses on the toxicity to activated sludge systems and anaerobic digestion, partitioning and intermediate transport including volatilization and sorption, and the biodegradability, including kinetics and effluent quality, as a function of solids retention time. If the organic compound being tested is biodegradable, the protocol can be used to develop kinetic data which are useful in predicting the effluent concentration of the specific compound from a given wastewater treatment plant as a function of the cell residence time. Also included in the protocol are methods for determining the amount of a compound which can be adsorbed onto biomass solids or air stripped, and methods for predicting losses of the compound from full-scale installations. FACTORS INFLUENCING BIOLOGICAL NITRIFICATION OF STEEL INDUSTRY WASTEWATERS,

Pittsburgh Univ., PA. Dept. of Civil Engineering.
R. D. Neufeld, A. J. Hill, and J. H. Greenfield.
AIChE Symposium Series, Vol 77, No 77, No 209, p 151-158, 1981. 7 Fig, 1 Tab, 12 Ref.

Descriptors: *Wastewater treatment, *Nitrification, *Biological wastewater treatment, Acidity, Temperature effects, Industrial wastes, *Steel industry, Industrial plants.

Basic studies were conducted into possible causes of biological nitrification process instability as currently observed in many industrial wastewater operations in order to eventually propose rational and pragmatic process operational alternatives for the biological oxidation of ammonia. It is noted that pH acts in conjunction with total ammonia levels to cause the free ammonia concentration in solution to act as a master variable influencing nitrification biokinetics. Free ammonia level acts as a substrate inhibitor to nitrification biokinetics, with a maximum in specific nitrification removal rates existing at free ammonia levels of about 10 mg/liter. Free ammonia begins to inhibit nitrification at 10 mg/1. Suggested sludge ages to maintain effective nitrification when free ammonia is neither limiting or inhibitory are 15-18 days for a pH of 7.0; 9-12 days for a pH of 8.0; and 12-15 days for a pH of 9.0. Nitrification biokinetics are very sensitive to elevated temperatures. Wastewater temperatures should be kept below 30 degrees C to assure stable nitrification, producing effluents of 10 mg/liter ammonia or less. Trace organics act as toxic inhibitors to nitrification biokinetics. Phenol, for example inhibited the maximum rate of specific ammonia utilization in a manner proportional to the square root of the phenol concentration. (Baker-FRC)

TROUBLESHOOTING AND CONTROL OF NITRIFICATION WASTEWATER TREATMENT SYSTEMS,

Engineering-Science, Inc., Austin, TX.
D. L. Ford.
AIChE Symposium Series, Vol 77, No 209, p 159-170, 1981. 10 Fig, 4 Tab, 14 Ref.

Descriptors: *Wastewater treatment, *Nitrification, *Design criteria, Operating policies, Management planning, *Biological wastewater treatment.

The concepts of biological nitrification are discussed, design aspects are considered, and operational techniques needed for troubleshooting and process control are outlined. Biological nitrification systems include both fluidized, activated sludge type reactors and fixed growth reactors, the latter including trickling filters and rotating biological contactors. Some of the more prevalent factors which influence nitrification include temperature, dissolved oxygen levels, pH, alkalinity, substrate loading, and sludge age and inhibition of nitrifiers. Many design concepts for nitrification systems have been developed over the years, but most have centered around some modification of fluidized activated sludge systems. Many approaches have been proposed in defining nitrification kinetics to establish basic criteria for design of fluidized nitrifying systems. Nitrification can be achieved in a single stage carbonaceous/nitrification system. The retention time or sludge age must be sufficient to enable the nitrification reactions to approach completion. The use of side stream aeration and two stage aeration has been shown to be nitrification-effective, with perhaps greater process reliability during cold weather periods and upset conditions. The most significant factors which relate to operational control and troubleshooting include defining and maintaining nitrifying population, dissolved oxygen control, alkalinity and pH control, influent transients, and the detection and control of inhibitory substances. It is important in any treatment system to detect process problems and offer remedies in the shortest time possible. (Baker-FRC)

THE REDUCTIVE TREATMENT OF INDUSTRIAL WASTEWATERS. I. PROCESS DESCRIPTION,

Envirogenics Systems Co., El Monte, CA.
K. H. Sweeny.
AIChE Symposium Series, Vol 77, No 209, p 67-71, 1981. 4 Fig, 2 Ref.

Descriptors: *Wastewater treatment, *Chemical reduction, Economic aspects, Management planning, Industrial wastes, Toxicity, Chemical reactions, Organic compounds, *Industrial wastewater.

Many toxicants found in waste streams from chemical industry plants can be successfully degraded by chemical reduction using a catalyzed metal powder as the reductant. In particular the process is useful for toxicants dissolved in water, which cannot be removed by physical means. It is common to achieve degradation to 1 microgram/liter or less. This level of contamination is safe for discharging the waters. The process is simple, effective and economical. Catalyzed iron, zinc, or aluminum powders have been effectively employed as reductants by such mechanisms as hydrogenolysis, hydroxylation, saturation of aromatic structure, condensation, ring opening, and rearrangement to change the toxicants to an innocuous form. Wastewater to be so treated may be trickled through a bed of the reductant which is diluted with an inert solid so as to give suitable retention

and flow properties, or preferably with a bed of the reductant fluidized by the aqueous waste solution. Retention times of about 5 minutes at ambient temperatures and flow rates as high as 0.9 cubic meters per minute per square meter have been achieved. The degradation of hexachlorocyclopentadiene and nitrophenol are cited as examples of the process. The process may be designed using a pump, flow control system and fluidized bed reactor. The treatment cost is estimated to be significantly lower than that of carbon sorption methods. (Baker-FRC)

THE REDUCTIVE TREATMENT OF INDUSTRIAL WASTEWATERS. II. PROCESS APPLICATIONS,

Envirogenics Systems Co., El Monte, CA.
K. H. Sweeny.
AIChE Symposium Series, Vol 77, No 209, p 72-78, 1981. 7 Tab, 6 Ref.

Descriptors: *Industrial wastes, *Chemical reduction, *Wastewater treatment, Chemical reactions, Toxicity, Organic compounds, *Industrial wastewater.

Several applications of chemical reduction in the treatment of chemical plant toxic waste streams are described. In general the toxicants are chemically changed to a form which is innocuous to the environment, rather than remaining in a concentrated solution or being discharged to the air. Trihalomethanes such as chloroform and bromoform and their intermediates were degraded in a 6 month program, from an average of 242 micrograms per liter to well below the control level set by the Environmental Protection Agency, with 75% of the tested samples reading below 5 micrograms per liter. Trichloroethylene reduction was accomplished, with a decrease in contaminant content from 280 to 3.9 micrograms/liter. Similar reductions were noted for trichloroethane and tetrachloroethane and tetrachloroethylene. Reductive tests with aqueous solutions of chlorobenzene appear to demonstrate both that the material is substantially degraded and that the product is mainly cyclohexanol. Successful degradation of a PCB waste to detection limits was shown, as well as degradation of chlordane. The chlorinated phenoxyacetic acid derivatives were substantially degraded, as was Kepone. The s-triazine derivative atrazine was 90% degraded. N-Nitrosodimethylamine was degraded to detection limits, and di- and trinitrophenols were substantially reduced. The wide range of applicability of the process, the low operating and capital costs, and its effectiveness suggest that reductive degradation may be a promising solution to many waste problems. OZONE FOR THE TREATMENT OF HAZARDOUS MATERIALS,

Jacobs Engineering Group, Washington, DC.
R. G. Rice.
AIChE Symposium Series, Vol 77, No 209, p 79-107, 1981. 7 Fig, 14 Tab, 83 Ref.

Descriptors: *Hazardous materials, *Ozonation, Disinfection, Water treatment, Industrial wastes, *Heavy metals, Oxidation, Cyanides, Sulfides, Industrial wastes, Wastewater treatment, Wastewater disposal.

The known aqueous reactions of ozone with both organic and inorganic chemicals listed on the hazardous materials list are discussed in terms of the ability of ozone to destroy the hazardous compound. Other reactions are considered in which ozone is known to simply convert one specific hazardous material into another. Ozone oxidations in aqueous media are usually dependent on pH. At higher pH ranges of 8 to 9 the ozone decomposes to form hydroxyl free radicals. At low pH, ozone reacts as the free ozone molecule, usually oxidizing at slower rates than at elevated pH. At low pH, amine-nitrogen atoms are protonated and stabilized to oxidation at this point in the molecular structure. Unsaturated aliphatics are generally readily reactive with ozone unless halogenated to high levels. Saturated aliphatics are unreactive. Benzene is slowly oxidized and other aromatics are generally easily oxidized by ozone except when electron-withdrawing substituents are present on the ring. Heavy metals can be oxidized to their highest state by ozone. Easily oxidized hazardous inorganic anions such as cyanide, sulfide, and thiocyanate can be destroyed by ozonation. Ozonation in the presence of UV radiation, ultrasound and/or hydrogen peroxide causes organic oxidations to proceed at significantly increased rates. Ozonation of organics rarely proceeds completely to carbon dioxide and water. Ozonation of some pesticides yields other hazardous products, some of which are stable to further ozonation. (Baker-FRC)

EVALUATION OF TEMPERATURE EFFECTS IN AERATED BIOTREATERS,

McKinsey and Co., Amsterdam, (Netherlands).
M. M. Friedman, and H. van Doesburg.
AIChE Symposium Series, Vol 77, No 209, p 112-121, 1981. 7 Fig, 4 Ref.

Descriptors: *Wastewater treatment, *Model studies, *Temperature effects, Aeration, Aerators, *Biological treatment, Biological wastewater treatment, Mathematical model.

To better quantify the temperature phenomenon in biotreating of wastewater, the factors that determine the temperature in the aeration basin have been studied, using a literature model. Testing of this model on data from eight different industrial biotreating systems gave evidence that the measured aerator temperatures could be adequately predicted by the model to within 1 to 3 degrees C. A subsequent parameter sensitivity analysis of the model led to a general, simplified correlation of the heat exchange characteristics of the eight treatment systems. Analysis of the non-steady-state version of the model showed that seven of the eight systems respond fairly quickly to changes in ambient or operating conditions, these changes being noted in less than one day's time. Such analysis can be used to determine various temperature control operating strategies as well as to provide guidance in the design of biotreatment systems. Seasonal changes in temperatures should be taken into account in setting up wastewater effluent quality standards. (Baker-FRC)

INTERMITTENT BIOLOGICAL WASTE TREATMENT SYSTEMS-PROCESS CONSIDERATIONS,

New South Wales Univ., Kensington (Australia).
M. C. Goronsky, D. Barnes, and R. L. Irvine.
AIChE Symposium Series, Vol 77, No 209, p 129-136, 1981. 10 Fig, 5 Tab, 16 Ref.

Descriptors: *Wastewater treatment, *Activated sludge process, Sludge, Design criteria, Operating policies, Maintenance, Management planning, Oxygen uptake, *Biological wastewater treatment.

This paper reports on full scale activated sludge systems which are operated over a range of loading conditions. Conventional activated sludge and continuously fed, sequentially aerated and decanted plants were studied under similar overall loading conditions. The performance of each system was measured in terms of oxygen utilization rate and effluent quality and was related to the short term loading on the plants as expressed by an instantaneous food to microorganisms ratio. Laboratory studies supplemented the full scale plant results. Continuously fed, intermittently aerated and decanted activated sludge systems provide an effective method of damping organic and hydraulic load transients. The biomass response of these completely mixed systems was significantly lower than that determined in the continuous conventional activated sludge plant. Single tank treatment systems contain a high mass of sludge available to adsorb and metabolize the influent organic loads. In a conventional continuous activated sludge plant the system is designed such that the capacity of the aerobic biological reactor corresponds to only 4 to 8 hr retention. Additionally, a proportion of the total sludge is contained in the secondary sedimentation tank, so that it can be removed from the wastewater. In the single tank systems retention, and sludge is not removed for separate clarification. Thus the response of these systems to increased organic loads will be well damped due to the capacity of the system. (Baker-FRC)

ENERGY MINIMIZATION AT METRO DENVER SEWAGE DISTRICT,

Metropolitan Denver Sewage Disposal District No. 1, CO.
W. E. Korbitz.
AIChE Symposium Series, Vol 77, No 209, p 21-24, 1981.

Descriptors: *Wastewater treatment, *Management planning, Economic aspects, *Energy conservation, Fuel, Design criteria, Planning, Water quality, Standards, Municipal wastewater, *Denver, Colorado.

Energy minimization efforts undertaken by the Metro Denver Sewage District are described. One of the major accomplishments lies in the secondary treatment process, where the original 370 million liters per day diffused air system was supplemented with a 272 million liters per day high purity oxygen system secondary treatment complex. The high oxygen transfer efficiency and lower total electrical power requirements have resulted in substantial savings. In the operation of the two secondary treatment complexes, flow has been sent to the high purity oxygen system at a rate such that it will be operated at capacity. The energy savings realized from close control over flow proportioning to the two secondary treatment complexes are considerable. Many cost savings as well as energy savings have also been made possible with the computer process control. Changes in operational procedures similar to the secondary treatment flow proportioning and consideration of electric motor retrofitting with capacitance equipment are methods of reducing demand. Other major successes are seen in the processing and disposal of sludge. Since 1971 sludge disposal has been in the form of land application. Anaerobic digestion of primary and waste activated sludge started in 1979 and is now part of the sludge processing line. There have also been revisions in water quality standards and treatment requirements so as to provide not only cost effective treatment but also energy effective treatment. (Baker-FRC)

RETROFIT CONSERVES ENERGY AT A WATER POLLUTION CONTROL FACILITY,

Velzy (Charles R.). Associates, Armonk, NY.
A. S. Haimes, and J. Dedyo.
AIChE Symposium Series, Vol 77, No 209, p 25-30, 1981. 2 Fig, 4 Tab.

Descriptors: *Wastewater treatment, *Phosphorus removal, Water pollution control, Activated sludge process, Lime, Microorganisms, *Energy conservation, Phosphorus, PhoStrip process.

In order to replace the existing chemical phosphorus removal process at a wastewater treatment plant in Amherst, New York, a major retrofit of process structures and incorporation of additional mechanical equipment was undertaken. Replacement was by a biological phosphorus removal process which will reduce energy use up to 81% and lime use up to 86% at thhe water pollution control facility. Such a major undertaking was an unusual step during the final stages of plant construction. The PhoStrip process will result in an operational cost savings of almost one million dollars annually. The removal of phosphorus is accomplished as follows. A portion of the phosphorus rich sludge from stage 1 clarifiers is diverted to a phosphorus stripper tank. The rest of the sludge either returns to the stage 1 oxygen transfer basins or is wasted. The sludge in the stripper tank is held in an anoxic environment, during which time the microorganisms release stored soluble phosphorus to the supernatant. The phosphorus stripped sludge is then returned to the stage 1 oxygen transfer basins. At this point, the microorganisms are returning to an aerobic environment and will take up

phosphorus in excess of that required for growth. Dilution of the influent sludge to the stripper is required to help maintain a proper sludge blanket depth and improve the stripping process. This stripper influent dilution flow is taken from the effluent of the stage 1 clarifiers. Phosphorus enriched supernatant is conveyed to the reactor clarifier, where it is limed. Reactor clarifier effluent is returned to stripper tank as an elutriation stream which is low in phosphorus concentration. (Baker-FRC)

BIOLOGICAL NITROGEN REMOVAL SYSTEM DESIGN,

Utah Univ., Salt Lake City.
H. D. Stensel.
AIChE Symposium Series, Vol 77, No 209, p 327-338, 1981. 8 Fig, 2 Tab, 15 Ref.

Descriptors: *Nitrogen removal, *Denitrification, *Respiration, *Wastewater treatment, Nitrification, Biological treatment, Design criteria, Nitrates.

Biological nitrogen removal systems which do not require an outside carbon source are discribed. Two types of nitrate reduction can occur: substrate nitrate respiration, where nitrate is reduced during the assimilation and oxidation of waste organic material (anoxic-aerobic system), and endogenous nitrate respiration, where nitrate is reduced during the respiration of the system biomass (channel flow system). There are also systems which alternate the anoxic and aerobic cells, ending with an aerobic zone. In substrate nitrate respiration the factors affecting nitrification rates are anoxic zone food to mass ratio, type of wastewater, nonbiodegradable solids present, and temperature. Endogenous respiration is affected by system mean cell residence time, specific carbonaceous oxygen uptake rate, net oxygen utilization coefficient, and net solids yield. Examples are given for design of an anoxic-aerobic system and an endogenous nitrate respiration system. (Cassar-FRC)

INHIBITION OF NITRIFYING ACTIVATED SLUDGE SYSTEMS BY ORGANIC SHOCK LOADS,

Oklahoma State Univ., Stillwater. School of Civil Engineering.
A. Esfandi, and D. F. Kincannon.
AIChE Symposium Series, Vol 77, No 209, p 339-344, 1981. 5 Fig, 1 Tab, 11 Ref.

Descriptors: *Shock loads, Nitrification, *Organic loading, *Wastewater treatment, Chemical oxygen demand, Ammonia, Pilot plants, *Activated sludge process.

The effect of organic shock loads on nitrification was investigated in a pilot plant on-stage activated sludge unit. A synthetic wastewater containing 500 mg per liter glucose and 250 mg per liter ammonium sulfate was treated at different COD and NH3 loadings: 2-, 3-, and 4- fold increases in both glucose and ammonia levels, 2-fold increase in glucose with constant ammonia concentration, and 2-fold increase in ammonia with constant glucose constant concentration. The 3- and 4-fold shock loads inhibited nitrification and caused slight increases in effluent COD. Nitrification activity recovered after 25-35 days, but effluent NH3 remained higher (60-120 mg per liter) than before the shock loads. Doubling COD, NH3, or both suppressed nitrification. NH3 levels returned to zero, except in the 2-fold NH3 shock load, where they remained slightly elevated (20 mg per liter). Effluent COD showed a slight, temporary increase in the 2-fold COD shock load experiment, but was constant in the other two 2-fold runs. (Cassar-FRC)

ICI BRIXHAM - ENVIRONMENTAL RESEARCH IN THE PRIVATE SECTOR.

Water Services, Vol 85, No 1026, p 403-405, 1981. 2 Fig, 9 Ref.

Descriptors: *Environmental protection, *Research facilities, Water treatment, Effluents, Water treatment facilities, *Wastewater treatment, Laboratories.

Brixham Laboratory is the major ICI environmental center serving the company by investigating the effects of chemical discharges in both liquid and gaseous form and in developing new ways of treating the problems and testing products for their effect on the environment. The company also has produced products helpful in treatment of different types of effluents. The Deep Shaft was originally developed as a highly efficient and space saving effluent treatment plant. The process involves the passing of raw but screened effluent through a U-shaped pipe some 120 meters long, set 60 meters into the ground. At a certain point on the down tube air is injected into the flow and the force of the effluent carries this down to the U of the pipe. As the pressure increases, the oxygen is given up from the air more easily and absorbed by the bacteria. The air also gives buoyancy to the effluent and encourages it to rise up the next part of the tube. Once at the surface, the effluent is passed through a bubble stripping device and passed to the final treatment. The company also produced Flocor plastic filtration media. Brixham Labs has been engaged in studies of site investigation for outfalls into estuarine and coastal waters, and has designed many successful plants for the treatment of effluents before discharge. Considerable effort has gone into developing analytical techniques to meet the needs of the water industry. (Baker-FRC)

REMOVAL OF TOXIC HEAVY METAL IONS FROM WASTEWATERS USING MODIFIED AGRICULTURAL WASTE MATERIALS,

Visvesvaraya Regional Coll. of Engineering, Nagpur (India). Dept. of Chemistry.
P. Kumar, and S. S. Dara.
Water Science and Technology, Vol 13, No 7, p 353-361, 1981. 2 Fig, 6 Tab, 17 Ref.

Descriptors: *Industrial wastes, *Heavy metals, *Wastewater treatment, *Food processing wastes, Industrial wastewater, Onions, Copper, Lead, Zinc, Cadmium, Farm wastes, Plant tissues, Sorption, Adsorption, Cations.

The toxic heavy metal binding capacities of agricultural byproducts such as bagasse, flour waste, paddy husk, paddy straw, onion skin and garlic skin were determined in equilibrium experiments. Onion skins were found to be the most efficient in binding heavy metal cations from solution. The onion skins were treated with sulfuric acid and formaldehyde to improve the physical characteristics of the substrate and minimize color leaching into the solution. The effect of contact time, temperature, pH and various anions on the uptake of metal ions by the modified onion skins was investigated in both equilibrium and column experiments. The residual metal ion concentration in the effluent was reduced to less than 0.1 ppm under steady state conditions using a column of the substrate. The scavenging capacity of the substrate for the cations was 1.6 meq/grams of substrate for Cu, 1.55 meq/gram for Cd, 1.35 meq/gram for Pb and 1.23 meq/gram for Zn. Methods for metal cation recovery and probable mechanisms of sorption are indicated. The implications of using modified onion skins for scavenging heavy metal ions from industrial wastes are discussed. (Geiger-FRC)

BIOENGINEERING ASPECTS OF AEROBIC MICROBIAL PIGGERY WASTE TREATMENT, PART II. EFFECT OF CONTROLLED CONDITIONS ON GROWTH OF MICROFLORA AND EFFICIENCY OF BIODEGRADATION,

Vysoka Skola Chemicko-Technologicka, Prague (Czechoslovakia).
J. Paca.
Process Biochemistry, Vol 15, No 2, p 7-10, February, 1980. 1 Tab, 8 Fig, 23 Ref.

Descriptors: *Biodegradation, *Aerobic bacteria, *Waste treatment, *Aerobic digestion, Agricultural wastes, Aerobic conditions, Aerobic treatment, Hogs, Biological treatment, Feedlot runoff, Manure, Farming, Agricultural watersheds, Microorganisms, Dilution, *Feedlot wastes.

Experiments were performed in batch and semicontinuous systems to determine the rate of biodegradation of piggery wastes. Based on these results and those obtained in a pilot plant, a plant capable of processing wastes of over 20,000 pigs was designed. Chemical analysis of fresh piggery wastes showed that this material contains high concentrations of copper salts which are added to commercial pig feed. Antibiotics are also added. These potentially toxic compounds for the metabolic activity of microorganisms decrease both the growth rate and the ability of microorganisms to degrade organic compounds. Longer times are necessary for biological treatment to overcome the chemical inhibitors. Aerobically treated wastes are preheated by vapor condensation. Volatile odor compounds are separated from the condensate, and the condensate is further treated in a multiple effect evaporator. (Titus-FRC)

TYPE A ZEOLITE IN THE ACTIVATED SLUDGE PROCESS--II: HEAVY METAL REMOVAL,

Plano-Empresa de Projectos, Lda., Lisboa (Portugal).
J. J. T. Carrondo, J. N. Lester, and R. Perry.
Journal of the Water Pollution Control Federation, Vol 53, No 3, p 344-351, March, 1981. 7 Fig, 5 Tab, 22 Ref.

Descriptors: *Heavy metals, *Activated sludge process, *Zeolites, *Wastewater treatment, Water softening, Hardness, Chemical properties.

Type A zeolite is an insoluble aluminosilicate capable of removing calcium hardness and, to a lesser extent, magnesium hardness from washing solutions and thus is used as a detergent builder. This study investigated the influence of type A zeolite on the removal of heavy metals in the activated sludge process using two pilot plants, one of which had no zeolite added to the influent wastewater. Primary settled wastewater fed to the treatment units contained nominal type A zeolite concentrations of 15 and 30 milligrams per liter, with two levels of calcium exchange for sodium in the zeolite (25 percent and 75 percent of maximum exchange capacity). The initial heavy metal concentrations in the wastewater in this hardwater area were low. No effect on heavy metal removals was noted for the metals tested at the 75 percent rate of calcium exchange, which is the normal exchange level expected to have been reached by the time the aeolite reaches a wastewater treatment plant. No effect was detected on cadmium, chromium, nickel, or lead removals in activated sludge at the lower rate of calcium exchange, which represents the level of exchange expected to have occurred after a washing program. Small but significant differences were noted for copper and zinc removals during two of the sampling periods, indicating a slight improvement in copper removal in the presence of zeolite. The removal of iron appeared to be unaffected by the presence of zeolite. No adverse effects were detected in the removal of heavy metals in the activated sludge process at either the normal or the high concentrations expected to occur in wastewaters when zeolite is used in detergents. (Carroll-FRC)

THE ACTIVATED SLUDGE PROCESS--3. SINGLE SLUDGE DENITRIFICATION,

Cape Town Univ. (South Africa). Dept. of Civil Engineering.
A. C. Van Haandel, G. A. Ekama, and G. V. R. Marais.
Water Research, Vol 15, No 10, p 1135-1152, October, 1981. 11 Fig, 1 Tab, 22 Ref.

Descriptors: *Activated sludge process, *Denitrification, Model studies, Mathematical studies, Nitrification, *Wastewater treatment, Wastewater facilities.

It is demonstrated that in the single sludge nitrification-denitrification process when the organisms are in the anoxic phase it is necessary to change the value of only one of the kinetic constants in order to model the nitrification-denitrification single

sludge system in terms of the bi-substrate active-site death-regeneration model of Dold. This change allows the Dold model to be extended so as to simulate very closely the response of the multi-reactor nitrification-denitrification process configurations under both constant and cyclic flow and load conditions. The denitrification response predicted under constant flow and load conditions can be reduced to that approximated by a zero order reaction with two rates in the primary and one in the secondary anoxic reactor respectively. The fundamental kinetic constants in the expressions for substrate utilization and nitrification are affected by the wastewater characteristics. The variability of the constants for nitrification is greater than that for substrate utilization. A single reactor system operated under sequential anoxic and aerobic periods constitutes a convenient experimental setup for determining the values of the kinetic constants of nitrification and substrate utilization and of denitrification in the anoxic phases. DEMONSTRATION OF ANAEROBIC BIOGAS DIGESTERS IN DEVELOPING COUNTRIES. PART III: THE PHILIPPINES,

Philippines Univ., Manila. Inst. of Public Health.
M. H. Simpson, and E. C. Morales.
Journal of Environmental Sciences, Vol 23, No 2, p 20-24, March, 1980. 8 Tab, 4 Fig, 6 Ref.

Descriptors: *Anaerobic digestion, *Biodegradation, *Biological treatment, *Wastewater treatment, *Energy sources, Technology, Anaerobic conditions, Dissolved oxygen, Waste management, Gasification, Farm wastes, Agricultural engineering, Manure, Agriculture, Sludge, *Philippines.

Waste management in the Phillippines also provides an energy source. Biogas plants, which have been widely established since 1977, turn waste products into energy sources. Effluent water is used for production of algae for livestock and poultry feed as well as production of fish and fertilizing-irrigating of pasture and vegetable plots. Because the Philippines is an agricultural country, there are large supplies of locally available raw materials for biogas production. The use of biogas digesters in sewage disposal systems in housing developments is now under consideration. However, the efficiency of biogas production from human waste is relatively low. (Titus-FRC)

THE TERTIARY TREATMENT OF SEWAGES. CONCLUSION,

Loughborough Univ. of Technology (England).
K. V. Ellis.
Effluent and Water Treatment Journal, Vol 20, No 11, p 527-529, 531-533, 535, 537, November, 1980. 1 Tab, 41 Ref.

Descriptors: *Sewage treatment, *Tertiary treatment, Filtration, Flotation, Reviews, *Great Britain.

The tertiary treatment of sewages is reviewed. Specific attention is given to the moving bed filter, microstrainers, maturation ponds, and other tertiary treatment methods, including nitrifying filters. Use of the moving-bed filter eliminates the necessity of periodically removing the filter from operation in order to clean it. Microstrainers are hollow cylinders, with the cylindrical surfaces covered with a fine stainless steel fabric. In general a microstrainer can be expected to remove between 50 and 60% of the suspended solids from a secondary effluent together with somewhat over 30% of the remaining BOD. Microstrainers have been used in the treatment of industrial wastewaters and to strain storm waters. Maturation ponds are widely used as the third stage in the progression through the stabilization pond process. The principal disadvantages are the area of land required and the possibility of discharging an effluent with a high algae content. Dissolved-air flotation can deal with periodic excessive loss of solids from secondary settlement tanks. (Baker-FRC)

SAND-FILTER TRENCHES FOR PURIFICATION OF SEPTIC TANK EFFLUENT: I. CLOGGING MECHANISM AND SOIL PHYSICAL ENVIRONMENT,

Norges Landbrukshoegskole, Vollebekk. Dept. of Microbiology.
R. Kristiansen.
Journal of Environmental Quality, Vol 10, No 3, p 353-357, July-September, 1981. 5 Fig, 2 Tab, 31 Ref.

Descriptors: *Sand filters, *Wastewater treatment, *Clogging, Filters, Sand, Physical properties, Soil physical properties, Soil chemistry, Ponding, Temperature effects, Soil water, Carbon, Nitrogen, Oxidation-reduction potential, *Septic wastewater, *Norway.

The Norwegian manual of septic tank practice prescribes a 20-meter artificial sand-filter trench per family-house for areas in which the soil is not suitable for direct disposal of septic tank effluent. Although the phenomenon of clogging in such disposal systems has been studied, the effects of clogging on purification efficiency have not been stressed. The relationship between clogging and soil physical and chemical environment in sand filter trenches was investigated over a 17-month period. Trenches were loaded with septic tank effluent at a rate of 4 to 6 cm/day (A and C) or 12 to 18 cm/day (B). Ambient temperatures of 4 to 16 C were maintained in trenches B and C, while the temperature in A was 12 to 15 C. Sand surface clogging and ponding occurred in the end of the filters where septic tank effluent concentrated. Ponding rates and crust resistances were highest for trench A, at 0.33 square meters per month and 35 days, respectively, and lowest for trench C, at 0.16 square meters per month and 4 days, respectively. The carbon/nitrogen ratio in the crust zone was similar to that in the rest of the sandfill. About 0.74 percent of the pore volume in the clogged layer of trench A was occupied by bacterial cells. Production of extracellular slimy material was probably dependent on temperature. Soil water content below the crust zone decreased with increasing clogging intensity. The increased clogging led to improved aeration, as shown by gas and redox measurements. Low redox potential values of less than 0 mV and oxygen contents below 2 percent were found mostly in the crusted zone of unit A, although they were also regularly found down to 30 centimeters in the clogged end of unit C. Nitrogen contents of up to 93 percent were found in sand filter zones containing less than 1 percent oxygen. N20 contents above the detection limit of 200 parts per million were not found in any of the filters. (Carroll-FRC)

SAND-FILTER TRENCHES FOR PURIFICATION OF SEPTIC TANK EFFLUENT: II. THE FATE OF NITROGEN,

Norway Agricultural Research Council, Aas.
R. Kristiansen.
Journal of Environmental Quality, Vol 10, No 3, p 358-361, July-Septmeber, 1981. 2 Fig, 1 Tab, 20 Ref.

Descriptors: *Nitrogen, *Sand filters, *Wastewater treatment, Filters, Sand, Oxidation-reduction potential, Soil properties, Nitrification, Temperature effects, Clogging, Biomass, *Septic wastewater, *Norway.

It has been suggested that septic systems in some areas contribute to the nitrogen content of groundwater. Nitrogen turnover in sand-filter trenches, important factors affecting nitrogen turnover, and the potentials of these filters for nitrogen removal were investigated as part of a 17-month study of sand-filter trenches. Trenches were loaded with septic tank effluent at a rate of 4 to 6 centimeters per day (A and C) or 12 to 18 centimeters per day (B). Ambient temperatures of 4 to 16 C were maintained in trenches B and C, while the temperature in A was 12 to 15 C. This study found that only insignificant amounts of nitrogen were removed from the effluent passing through the filters. During the cold seasons nitrification was significantly affected by the sand temperature. In trenches B and C, which had the lowest clogging intensities, nitrate was mostly found near the bottom air vent, while in A, which had the highest clogging intensity, nitrification occurred between 7.5 and 27 centimeters below the crust. Nitrogen bound in the microbial biomass, absorbed to the cation exchange complex, and bound in dead organic material could amount to about 3 months of nitrogen loading from a single-family home to a standard 20-meter sand filter trench. This nitrogen is only temporarily removed and will be subsequently nitrified and leached out. It appears that denitrification does not occur in continuously loaded sand filters. Potential means of improving denitrification in septic systems include intermittent loading or recycling of nitrified effluent. (Carrol-FRC)

MUNICIPAL WASTEWATER TREATMENT PLANT PIONEERS IN CONSERVATION APPROACH,

Pirnie (Malcolm) Inc., White Plains, NY.
R. F. Bonner, Jr.
Civil Engineering (New York), Vol 50, No 7, p 57-59, July, 1980. 3 Fig.

Descriptors: *Energy conservation, *Waste heat, Heat budget, Wastewater treatment facilities, Skimming, Fuel oil, Design criteria.

Energy conservation equipement has been incorporated into the expansion designs for the Southerly Wastewater Treatment Plant in the Northeast Regional Sewer District, Cleveland. Although the conservation technology used at this plant is not new, it is believed that this is the first municipal treatment plant to use this combination of features. Designs include 10 treated effluent water-to-water heat pumps and 6 exhaust air energy wheels to provide heat for 13 buildings, saving 450,000 gal of fuel oil annually. The skimmings recovery is expected to save 2.75 million gal of oil annually, and the waste heat recovery system, 1.18 million gal. (Cassar-FRC)

IMPROVED PERFORMANCE IN COMBINED NITRIFICATION/DENITRIFICATION OF TANNERY WASTE,

Science and Education Administration, Philadelphia, PA. Eastern Regional Research Center.
C. C. Panzer, M. Komanowsky, and G. E. Senske.
Journal of the Water Pollution Control Federation, Vol 53, No 9, p 1434-1439, September, 1981. 4 Fig, 3 Tab, 13 Ref.

Descriptors: *Tannery wastes, *Nitrification, *Denitrification, *Nitrogen removal, Industrial wastewater, Wastewater treatment, Biological treatment, Nitrates.

Over of 97% total Kjeldahl nitrogen (TKN) and 93% of soluble COD were removed from a lime sulfide unhairing effluent, which had been physically and chemically pretreated, in a laboratory scale combined nitrification/denitrification process. In six test runs, influent TKNs were 171-240 mg per liter; influent COD, 1039-1649 mg per liter. In the process the waste is nitrified in the aerobic zone and then returned to the anoxic zone for denitrification. The higher the rate at which the aeronic mixed liquor is returned to the anoxic zone, the greater the degree of nitrate removal, which in these runs ranged from 0.13 - 0.17 mg N per mg per day. A high influent COD produced better nitrate removal. The high rate and degree of nitrate removal in the first stage was enhanced in the laboratory system by limiting the rate of aeration in the last aerobic stage and sparging the anoxic zone with nitrogen gas. Although this would not be practical on a commercial scale, several possible alternatives are suggested. (Cassar-FRC)

MUNICIPAL SEWAGE: THREE COMMUNITIES TRY TO COPE,

A. Morrison.
Civil Engineering (New York), Vol 50, No 9, p 90-94, September, 1980. 3 Fig.

Descriptors: *Municipal wastewater, *Wastewater facilities, *Combined sewers, Milwaukee, Wisconsin, San Francisco, California, Winnipesaukee River, New Hampshire, Wastewater treatment, Sewer systems, Overflow, Legal aspects, Judicial decisions, Wastewater disposal, Effluent standards, Water pollution prevention, Water quality control, Cost-benefit analysis.

The City of Milwaukee is appealing to the Supreme Court for relief from the stringent antipollution requirements imposed by the Federal District Court. The decision ordered the city to upgrade its treatment system to the tertiary level and abate all combined sewer overflows by 1989, with all other overflows abated by 1986. The $1.6 billion master plan, which the city hopes will not have to be fully implemented, includes a collection, storage, and treatment plan to handle combined and separate sewer overflows. In addition to rehabilitating existing sewers and treatment plant, the plan calls for 460 miles of new storm sewers, 2 miles of new sanitary sewers, storage facilities, 2 major interceptor sewers, smaller interceptor and relief sewers, and a storage cavern built under the municipal stadium. San Francisco is working on a $2.3 billion three-stage plan for treatment and combination of primary and secondary effluents to discharge into the ocean. New Hampshire's Winnipesaukee River Basin project ($65 million) is designed to improve lakes for tourist and recreation purposes. At the project's completion in 1982, all secondary effluent will be discharged into the Merrimac River rather than into lakes where algal blooms have been troublesome. (Cassar-FRC)

EFFICIENCIES OF ADVANCED WASTE TREATMENT OBTAINED WITH UPGRADED TRICKLING FILTERS,

Brown and Caldwell, Eugene, OR.
D. P. Norris, D. S. Parker, M. L. Daniels, and E. L. Owens.
Civil Engineering (New York), Vol 50, No 9, p 96-101, September, 1980. 5 Fig, 3 Tab, 2 Ref.

Descriptors: *Trickling filters, *Solids contact processes, *Advanced wastewater treatment, Wastewater treatment, Corvallis, Oregon, Effluents, Biological oxygen demand, Suspended solids, Sludge, Clarification.

The trickling filter process, combined with solids contact clarification, can consistently produce an effluent quality meeting EPA's definition of secondary treatment. In plant-scale tests at Corvallis, Oregon, BOD5 and suspended solids of less than 10 mg per liter were obtained at filter loadings of 30 lb BOD5 per 1000 cu ft per day or less and 15 mg per liter at 40 lb BOD5 per 1000 cu ft per day. The waste secondary sludge is exceptionally dense and can be wasted directly to primary sedimentation, eliminating thickening. Optimum mixed liquor solids concentration is 1500 mg per liter. This low-cost, trouble-free, low-energy process may enable many existing trickling filter plants to upgrade their efficiency to meet today's standards with minimum capital outlay. (Cassar-FRC)

WATER COST ENCOURAGES REUSE AND CONSERVATION,

Pirnie (Malcolm) Inc., White Plains, NY.
G. P. Westerhoff.
Consulting Engineer (St. Joseph), Vol 57, No 3, p 87-90, September, 1981. 1 Fig.

Descriptors: *Water reuse, *Reclaimed water, *Water costs, Water management, Water conservation, Wastewater reuse, Water supply, Water shortage, Cooling water, Irrigation water, Steel industry, Prices, Industrial water, Legislation.

Water reuse is practiced extensively in the U.S. and other countries and can be expected to receive more attention as water supply problems and higher water prices occur. Water is directly reused in irrigation, recreation, groundwater recharge, and industry. Reclaimed wastewater is used in treatment plants for addition to potable supplies and for cooling water. Current industrial reusers are steel manufacturers, refineries, power plants, and chemical manufacturers. Water reuse projects are often difficult to implement because so many government agencies are involved. Computer models are helpful in formulating regional plans, which are more effective than local plans. Dual or plural water quality schemes offer economic advantages and stretch the supply. Water prices should more closely reflect actual costs of treatment, storage, and transmission to encourage reclamation and conservation. The Office of Water Recycling, created in 1977, sponsors research and development on major industrial reuse applications. However, funds for this office are expected to be reduced in future budgets. GAO FINDS MASSIVE FAILURE OF WASTEWATER TREATMENT PLANTS,

A. Morrison.
Civil Engineering (New York), Vol 51, No 4, p 74-76, April, 1981. 1 Tab.

Descriptors: *Effluents, *Discharge(Water), *Water pollution, *Design, *Wastewater treatment facilities, Wastewater treatment, Legislation, Regulations, Governments, Engineering.

A recent report from the General Accounting Office of Congress states that more than half of America's municipal waste water treatment plants are not functioning according to design. Effluents from 242 randomly selected plants were monitored. Between 1978 and 1979, 87% of these plants violated their discharge permits, 31% seriously. There are many reasons for plant failure: inferior equipment substituted under the federal procurement regulations 'or equal' clause, inadequately trained operations personnel, infiltration/inflow, and design failures. Accountability for these failures is difficult to fix, and the EPA has been reluctant to encourage legal action for several reasons. The final result is that Federal and State governments spend millions of dollars to bring treatment plants up to standard. (Cassar-FRC)

USE OF ADENOSINE TRIPHOSPHATE IN BIOLOGICAL PURIFICATION SYSTEMS (IN FRENCH),

Rennes Ecole Nationale Superieure de Chimie (France).
G. Martin, S. H. Nam, O. Vitrac, and M. Reinbold.
Water Research, Vol 14, No 4, p 379-387, April, 1980. 8 Fig, 1 Tab, 27 Ref.

Descriptors: *Wastewater treatment, *Adenosine triphosphate, *Activated sludge, Activated sludge process, Suspended solids, Biological wastewater treatment, Biomass, Organic loading.

The variation in adenosine triphosphate (ATP) of an activated, aerobic non-nitrifying sludge was determined as a function of the bulk loading under constant conditions. The study was intended to resolve the difficulty caused by different biological activity of microorganisms and the inactive particles included in determining biomass in purification units. Under steady state conditions the ATP content per unit of volatile suspended substances (VSS) of the sludges is a function of the bulk loading. The ATP amount is connected to the rate of active biomass, and is an indicator of the elimination of organic pollution. With organic supplementation the ATP level is relatively constant, but otherwise the variation is significant. A system functioning with a bulk loading of 0.5 based on COD can tolerate an organic or hydraulic overload of at least three-fold for a short time without difficulty. The ATP/VSS ratio was determined under a constant bulk loading and at a charge which varied from 0.44 to 9.4 kg COD/day/kg VSS. Measurements of ATP can be used to predict effects of biological accidents at a station, e.g., aeration interruption, a sudden load variation, or accidental arrival of contaminants. (Hertzoff-FRC)

DIRECT INFLUENCE OF WASTEWATER POLLUTANTS ON FLOCCULATION AND SEDIMENTATION BEHAVIOR IN BIOLOGICAL WASTEWATER TREATMENT-I. MODEL SYSTEM E. COLI B,

Swedish Inst. for Surface Chemistry, Stockholm.
L. Eriksson, and C. Axberg.
Water Research, Vol 15, No 4, p 421-431, April, 1981. 15 Fig, 2 Tab, 50 Ref.

Descriptors: *Sedimentation, *Escherichia coli, *Activated sludge, Flocculation, *Wastewater treatment, Colloids, Coagulation, Model studies, Pollutants, Biological treatment, Metabolism.

To obtain a high quality effluent when using the activated sludge process of waste water treatment, effective sedimentation is required. the rate of sedimentation depends upon the composition of pollutants in the waste water, the composition of the microbial flora, and the operational parameters of the treatment system. The metabolic activities, surface properties of the cells, and their release of polymeric materials should also be considered. A study was conducted on the effects of selected pollutants in waste water on the flocculation process to clarify the colloid chemical processes using the model system, Escherichia coli B. The amount of extracellular polymeric material present in the system affected the coagulation by neutral salts and the degree of influence of the model pollutants tested. For several of the pollutants tested, marked effects on sedimentation were noted when the cells were undergoing slow coagulation close to the critical coagulation concentration. These findings were attributed to the interactions between extracellular polymers and pollutants affecting the cellular bridging. (Geiger-FRC)

INDUSTRIAL WASTEWATER AUDIT,

Donohue and Associates, Inc., Sheboygan, WI.
M. L. Crosser, and J. Turk.
Industrial Wastes, Vol 26, No 3, p 22-24, 36, May/June, 1980. 1 Fig, 1 Tab, 9 Ref.

Descriptors: *Industrial wastes, *Steel industry, *Wastewater treatment, Aerated lagoons, Lagoons, Suspended solids, Heavy metals, Phosphorus, Evaluation, Wastewater analysis.

An industrial wastewater audit is an organized determination of the source, quantity, composition and chemistry of each wastewater stream at an industrial facility. The purpose of the audit is to develop the data base required to decide which combination of actions, including process changes, process water recycling and final treatment, will provide compliance with discharge standards at minimum cost and with minimum disruption of production. The requirements for such an audit and a case history of an audit are presented. The example cited is a stainless steel products manufacturing company. Five major steps compose an audit: understanding the processes and staff relationships, planning the flow monitoring sampling and analysis program, conducting the actual program, evaluating the data obtained, and writing the report. Wastewater treatment at this particular audit site was provided by an aerated lagoon, and waste loads were reduced by installing an evaporator to concentrate electropolishing rinsewater for chemical recovery. The audit results suggested that a program be devised to repair the plumbing, reduce process water usage, and divert clean water from the process wastewater sewer, resulting in a reduction of process wastewater from 80,000 to about 55,000 Gpd. An alternative to the phosphorus-containing alkali cleaning compound was selected. Methods for dealing with heavy metals

were reevaluated. A method to capture overflow from the alkaline washers was placed under study. (Baker-FRC)

OPERATION REPORTS–CITY OF PUEBLO, COLORADO DEPARTMENT OF PUBLIC WORKS,

Journal of the Water Pollution Control Federation, Vol 53, No 6, p 1149-1150, June, 1981. 4 Tab.

Descriptors: *Operating costs, *Wastewater treatment, *Pueblo, *Colorado, Anaerobic digestion, Municipal wastewater, Energy conservation, Methane, Sludge disposal, Stormwater.

The City of Pueblo, Colorado, treated 18.47 million cu meters (4.88 billion gallons) of wastewater at an average daily rate of 50,400 cu meters during 1980. An average of 2500 cu meters of methane was produced daily in the anaerobic digestion process. Effluent contained an average 21.8 mg per liter suspended solids, 32.5 mg per liter BOD, 6.74 mg per liter dissolved oxygen, 7.6 pH, 18.3 mg per liter ammonia, and 301.4 per 100 ml fecal coliforms. Cost per million gallons treated was $118. (Cassar-FRC)

ENGINEERS ASSESS AQUACULTURE SYSTEMS FOR WASTEWATER TREATMENT,

Cold Regions Research and Engineering Lab., Hanover, NH.
S. C. Reed, R. K. Bastian, and W. J. Jewell.
Civil Engineering (New York), Vol 51, No 7, p 64-67, July, 1981. 4 Fig.

Descriptors: *Aquaculture, *Wastewater treatment, Water treatment facilities, Water hyacinth, Duckweed, Wetlands.

An overview of wetland processes and aquatic plant systems is presented. Wetlands are defined as land where the water table is at or above the surface of the land long enough each year to maintain saturated soil conditions and growth of related vegetation. At present, wetland systems are generally limited to further treatment of secondary effluents. In a few cases primary effluent has been applied in constructed systems. Bacteria attached to plant stems and humic deposits are assumed to be the major factor for biological oxygen demand and nitrogen removal when plant harvesting is not practiced. Plant production plays a more significant role in nutrient removal when harvesting is included. For natural wetlands, major costs and energy requirements involved are significantly lower than if a wetland is constructed. One drawback of natural wetlands is that it is more difficult to control the process because of natural variability within the system. Health risks for wetland systems are probably not higher than for conventional treatments, assuming that insect vectors are controlled and harvested materials are not used for direct human consumption. Information on systems that use free floating aquatic plants for treating wastewater is limited to the use of either water hyacinths or duckweeds. Such systems are generally similar in concept to wastewater treatment-pond technology. Water hyacinth systems are able to remove high levels of BOD, suspended solids, metals and nitrogen, plus significant removal of refractory trace organics. The root systems support a very active mass of organisms that assist in treatment. (Baker-FRC)

THE FATE OF ORGANIC MICROPOLLUTANTS THROUGH AN INTEGRATED WASTEWATER TREATMENT WATER RECLAMATION SYSTEM,

National Inst. for Water Research, Pretoria (South Africa).
J. F. J. Van Rensburg, A. Hassett, S. Theron, and S. G. Wiechers.
Water Science and Technology, Vol 13, No 1, p 537-552, 1981. 3 Fig, 7 Tab, 20 Ref.

Descriptors: *Organic compounds, *Water reclamation, *Fate of pollutants, Wastewater treatment, Water treatment, Trihalomethanes, Pesticides, Insecticides, Trace levels, Polynuclear aromatic hydrocarbons, Phenols, Chlorinated hydrocarbons, Activated carbon, Adsorption, *South Africa.

An integrated wastewater treatment/water reclamation system (a modified lime flotation biological pilot plant), produced a final water superior in quality to water supplies in three South African cities as well as to the final effluent from a nonintegrated system. Potentially hazardous organic micropollutants were added to the feedwater at concentrations of 40 micrograms per cu dm for each compound. Effluents from each process step were analyzed to monitor the removal. The final effluent contained 0.8 micrograms per cu dm dibutyl phthalate (probably from the plastic pipe used in the pilot plant) and 2.6 micrograms per cu dm of total volatile halogenated hydrocarbons. Each step in the treatment process removed a percentage of the organic pollutants from the effluent of the preceding step as follows: dentrification, 37%; chemical clarification, 35%; nitrification pond and biological clarifier, 69%; prechlorination, 21%; roughing filter and dual media filter, 34%; activated carbon adsorption, 89%. Certain materials were removed selectively in certain steps of the process. Denitrification and chemical clarification removed a large percentage of most compounds. The biological clarifier reduced remaining naphthalene, dichlorvos, anthracene, m-cresol, chlorophenol, and beta-naphthol to nondetectable concentrations. Prechlorination removed the residual trichlorophenol; and filtration, the residual acenaphthene and hexadecane. Activated carbon served as a safety barrier to remove final traces of other organic compounds. Shock loads of 40 micrograms per cu dm of each of the 19 compounds for 30 hours resulted in complete removal of these compounds with no apparent ill effects on the plant. (Cassar-FRC)

THE DEEP-SHAFT PROCESS: BRIGHT FUTURE FOR TREATING HIGH-STRENGTH WASTEWATERS,

Civil Engineering (New York), Vol 51, No 5, p 74-76, May, 1981. 1 Fig.

Descriptors: *Wastewater treatment, Deep-shaft process, *Economic aspects, Primary treatment, Secondary treatment, Bacteria, Industrial wastes, Municipal wastes.

A new wastewater treatment process is described which makes use of a deep shaft, a process promising to cut land use 10-30% and power cost as well. Raw wastewater is injected into this deep shaft, where the high water pressure forces air bubbles into solution. The method is being tried at a New York wastewater treatment plant. In these underground aeration tanks air is added to the wastewater and bacteria break down the wastes. In the deep shaft process primary treatment is usually eliminated. Raw sewage is injected directly into the deep shaft, 40% of the way down, or at a depth of 200 feet. The wastewater travels down the inside of the downcomer pipe to the bottom of the shaft and then up through the annual space between pipe and shaft walls. The wastewater is moved round and round inside the shaft by compressed air bubbles injected about 40% of the way down the shaft. An individual slug of wastewater makes several cycles before being drawn off to the surface for clarification. Virtually all of the air that is injected into the wastewater column goes into solution, as dissolved oxygen, dissolved nitrogen, and other gases. Chief advantages are space saved, lack of need for primary treatment, production of a floated sludge that is much higher in solids concentrations than the sludge that settles out in a gravity clarifier, and apparent quick recovery from shock loadings. ANAEROBIC SLUDGE DIGESTION–NEED IT BE EXPENSIVE,

Severn Trent Water Authority (England).
C. E. Brade, and G. P. Noone.
Effluent and Water Treatment Journal, Vol 21, No 9, p 391-393, 395-397, 399-401, 403-406, September, 1981. 6 Fig, 5 Tab, 52 Ref.

Descriptors: *Sludge digestion, *Cost analysis, *Anaerobic digestion, Biodegradation, Digestion, Sludge, Anaerobic conditions, Biological treatment, *Wastewater treatment, Severn-Trent Waterway, United Kingdom.

Recent work carried out within the Severn-Trent Water Authority with the aim of improving and extending treatment processes while minimizing the resultant capital and revenue requirements is reported. The work resulted in several conclusions. It appeared that in the case of anaerobic digestion, failure to operate at maximum process efficiency was not due to biological overload, but rather to an inability within current operation to exploit the activities of the microorganisms. The approaches have been to uprate the processing input so that the biological process becomes rate limiting, rather than the physical factors of mixing, temperatures or seeding. Full scale plant investigations demonstrated that great scope exists to reduce the cost of anaerobic digestion by several methods. The first method calls for uprating the existing digestion plant, principally by improved mixing and heating, where examination shows the plant to be inadequate. Another method indicates that small to medium sized digestion centers can be cheaply acquired by changing the use of various available tanks, especially in semi-rural works. Finally, new green-field digestion plants should have much lower volumetric provisions, with more emphasis placed on process equipment and higher levels of standby equipment than is currently provided. Digestion improvement is not restricted to the primary reactor. Attention should also be given to the increase of input solids level and subsequent consolidation. One requirement for a more efficient process is closer plant control, involving more process analyses. (Baker-FRC)

CONTINUOUS ION EXCHANGE: A SURVEY OF RECENT APPLICATIONS,

M. J. Slater.
Effluent and Water Treatment Journal, Vol 21, No 9, p 416-418, 420-422, September, 1981. 8 Fig, 16 Ref.

Descriptors: *Ion exchange, *Wastewater treatment, Resins, Water treatment, Industrial wastes, Radioactive wastes, Design criteria, Wastewater facilities.

This article surveys the main types of apparatus and their important design features for continuous ion exchange systems. The major industrial types of moving packed bed and fluidized bed plants are described. While various industrial applications of moving packed bed plants have been planned, the impact on the water treatment industry is not marked. The chemical efficiency of fixed bed plants can be made to approach that of continuous plants by using counter-flow regeneration or the merry-go-round principle. Continous plants need to be made cheaper so that they can be used on a smaller scale, and the reliability, although high, perhaps needs to be demonstrated more clearly and improved further. Fluidized bed plants have a part to play in treating dirty waste streams or ore leach solutions and have become accepted, but further simplification is desired to make recovery of low value solutes economically worthwhile. KINETICS OF PHENOL OXIDATION BY WASHED CELLS,

University Coll. of Swansea (Wales). Dept. of Chemical Engineering.
W. Sokol, and J. A. Howell.
Biotechnology and Bioengineering, Vol 23, No 9, 2 fig, 6 Tab, 13 Ref.

Descriptors: *Phenol, *Oxidation, *Bacteria, Pseudomonas putida, *Fate of pollutants, *Wastewater treatment, Model studies, Microorganisms, Fermentation, Kinetics, Monod-Haldane equation.

A model was developed to predict the uptake of phenol by organisms growing in continuous culture on phenol in the high conversion range. Uptake rates of Pseudomonas putida per unit biomass per unit time were determined at phenol concentrations of 5 to 1000 mg per liter at intervals of 2.7 to 8 hours. The best fitting model was a 2-parameter simplification of the Monod-Haldane model. One parameter remained fairly constant with changes in growth conditions, while the other increased monotonically with phenol concentrations in the chemostat. The apparent threshold for induction was 0.1 mg per liter phenol. (Cassar-FRC)

DULUTH SANITARY DISTRICT FIRST IN U.S. TO TAKE CHARGE OF BOTH SEWAGE AND REFUSE.

Civil Engineering (New York), Vol 50, No 6, p 60-63, June, 1980. 2 Fig.

Descriptors: *Fluidized bed process, *Incineration, *Solid wastes, Wastewater treatment facilities, *Diluth, Minnesota, Activated sludge process, *Waste disposal, Advanced wastewater treatment, Oxygenation, Water quality, Wastewater disposal.

The Western Lake Superior Sanitary District, serving Duluth, Minnesota, is the first sanitary district in the U.S. to handle disposal of both wastewater and municipal refuse. A pure oxygen activated sludge process is used. Since the 45 mgd central advanced wastewater treatment plant went on stream in 1978, the water quality in the St. Louis River and St. Louis Bay has improved dramatically. Effluent from the plant has 10-12 mg per liter BOD and 10-12 mg per liter suspended solids, a higher quality than the state requires. Refuse is chopped to a final size of 1.5 in. and is air-separated into light and heavy fractions. The light, combustible fraction is coincinerated with sludge in a fluidized bed reactor, saving over $3 million in fuel costs alone. (Cassar-FRC)

GROUNDWATER CONTAMINATION BY CHLORINATED HYDROCARBONS: CAUSES AND PREVENTION,

Environmental Protection Agency, Philadelphia, PA.
H. G. Byer, W. Blankenship, and R. Allen.
Civil Engineering (New York), Vol 51, No 3, p 54-55, March, 1981. 3 Fig, 1 Tab.

Descriptors: *Chlorinated hydrocarbons, *Industrial wastes, *Water pollution control, Nitroglycerine trap, *Waste disposal, Ultimate disposal, Organic compounds, Aquifers, Path of pollutants, Soil contamination, Disposal, Waste storage, Landfills.

Chlorinated hydrocarbons, such as trichloroethylene, chloroform, and tetrachloroethane, have wide use in the U. S. in industry and in the home as solvents, degreasers, cleaning agents, etc. Waste treatment and disposal of these organic compounds, 4.6 million tons of which were produced in 1978, is difficult because of their high density and limited solubility in water. Unlike lighter oils, these dense compounds sink to the bottom of a stream, lake, pond, or landfill, thus becoming readily available for penetration into the underground aquifer. To prevent such contamination, industrial work places should have concrete floors, sloped to direct spills, and a 'nitroglycerine trap' to prevent material from escaping into sewers, streams, and the ground surface. Any wastewater holding pond or lagoon should be lined with impervious material to prevent groundwater contamination. Improper disposal or spills of chlorinated hydrocarbons may violate the Safe Drinking Water Act, the Toxic Substance and Control Act, the Solid Waste Management Act, the Resource Conservation and Recovery Act, and the Clean Water Act Amendment. (Cassar-FRC)

NOTE ON DESIGN OF DIFFUSERS FOR SEWAGE OUTFALLS BASED ON THE WORK OF RAWN ET AL.,

Waterloo Univ. (Ontario). Dept. of Man-Environment Studies.
E. J. Farkas.
Journal of Environmental Science and Health, Part A, Environmental Science and Engineering, Vol 16, No 2, p 251-257, 1981. 2 Tab, 11 Ref.

Descriptors: *Outfall sewers, *Wastewater disposal, *Design criteria, Lakes, Lake Ontario, Effluents, Sewage, Water currents.

A specific case is reviewed in which the design of a diffuser for a sewage outfall was based on the work of Rawn et al., in the hopes that future designers may benefit from certain questionable aspects of this design. The diffuser and sewer outfall in question were designed in 1974 and 1975. The outfall was intended to serve a new sewage treatment plant which was to accept sewage from a large area east and north of Toronto, Canada. The outfall takes sewage treatment plant effluent out into Lake Ontario via a 1000 meter tunnel bored in rock on the bed of Lake Ontario. Diffuser ports are arranged along the outer 150 meters of the tunnel. Vertical borings were made at even spacings along the tunnel, and the sewage effluent is released horizontally at the floor of the lake via nozzles, more than 6 meters below the lake surface. The first question which arises concerns the adaptability of the work of Rawn to fresh water, since the original work was designed for sea water. Another question pertains to the presence or absence of currents in the receiving water body. A very large margin of safety must be incorporated for cases in which there is any period of low- or no-current conditions in the receiving water. (Baker-FRC)

ENTRENCHMENT OF SEWAGE SLUDGE--A DISPOSAL-USE ALTERNATIVE,

Science and Education Administration, Washington, DC.
L. J. Sifora, and D. Colacicco.
Civil Engineering (New York), Vol 50, No 4, p 80-82, April, 1980. 2 Fig, 5 Tab, 6 Ref.

Descriptors: *Trenches, *Sludge disposal, *Land application, Metals, Food chains, Microorganisms, Crop production, Environmental effects, Bacteria, Fate of pollutants, *District of Columbia area.

An alternative disposal method for sewage sludge from the Washington, D.C., metropolitan area involves placing undigested sludge in trenches. The disposal rate is 1000-1300 wet tons per acre. Little odor and no surface runoff results. A sludge volume of 200-400 wet tons per day is handled using concrete mixer trucks, trenching machines, and pumping equipment. Sludge at 22% solids content is placed in a trench about 24 inches wide and 3 ft deep, on 3.9 ft centers. An interval of 4.9 ft or more between sludge and highest groundwater level is necessary. The trenching machine immediately follows the disposal trucks, covering the filled trench with soil dug from an adjacent trench. The surface is stabilized by leveling and applying lime, fertilizer, and grass seed. Corn grown on one of these sites 1 year after entrenchment had slightly higher Zn and Cu, but metal levels were within the range of levels found in corn grown with commercial fertilizers. However, sludges and crops vary, and no general statement on metal uptake or crop yield can be made. Trench plots monitored over a 5 year period showed little metal leaching. After 3 months fecal coliforms decreased by 5 to 7 log reduction and total coliforms by 2-3 log reduction. Salmonella and indicator virus (f2) were undetectable. Total coliforms remained elevated in the soil near the sludge-soil interface for 1 year. Estimated cost for the 400 ton per day operation in Washington is $24.40 per wet ton (1978 dollars). (Cassar-FRC)

COMPOSTING RESULTS IN LOS ANGELES,

R. T. Haug, and B. Davis.
BioCycle, Vol 22, No 6, p 19-24, November-December, 1981. 9 Fig, 7 Ref.

Descriptors: *Sludge, *Composting, Land disposal, Odors, *Sludge disposal, Organoleptic properties, *Wastewater treatment, Energy conservation, Municipal wastewater, Planning, Design criteria, Incineration, *Los Angeles, California.

The composting systems which will be a major part of the planned program for sludge management in the Los Angeles/Orange County Metropolitan area are discussed. When the LA/OMA project started, windrow composting was thought to offer many advantages, with the major disadvantage being the need for large land areas. Initial efforts were therefore directed at cutting back the needed land areas and reducing the dependence on other bulking agents or amendments. Four years later air drying of digested, dewatered sludge was tested on about 20 acres of land. Dewatered sludge was placed into long piles about 0.3 meters deep and turned periodically to enhance air drying and reduce the moisture content to less than 50% prior to landfill disposal. Actual operating experiences during wet weather confirmed the expected problems and emphasized the importance of wet weather operation. The LA/OMA operating agencies have substantial anaerobic digestion facilities and use the resultant digester gas to partially satisfy treatment plant power demands. Continued use of digester gas is a cost-effective approach to meeting treatment plant power demands. The feasibility of

composting digested sludge in rectangular bins about 3 meters deep was studied. A fully equipped, pilot scale, enclosed reactor composter was also studied. Composting and reuse was judged to have good prospects for inclusion in an overall sludge managment program. However, wet weather problems and odor and dust problems are still to be overcome. AN INTRODUCTION TO INDUSTRIAL WATER TREATMENT,

R. Hill.
Water Services, Vol 85, No 1026, p 399-402, 1981. 4 Fig.

Descriptors: *Water treatment, *Industrial water, Scale, Corrosion, Water quality, Quality control, Chemical reactions, Water hardness, Cooling towers, Sludge.

Water has a variety of uses in industry; for many of these uses it requires additional treatment beyond that received at the municipal water works. Problems arising out of the impurities remaining in the water after regular treatment fall mainly into the category of scale and corrosion. Scale occurs extensively in heating and steam raising plants and also in cooling towers. Scale is the result of the presence in the water of salts of calcium and magnesium, and hardness salts. Corrosion is the loss of metal from the structure containing the water and can happen through erosion, dissolving, and galvanic corrosion. The two distinct areas of water treatment are internal and external. Internal involves the addition of chemicals to a system to inhibit the reactions which cause scale and corrosion. External methods use specially designed items of equipment to remove the impurities which cause the problems. Scale inhibiting chemicals act by allowing hardness salts to precipitate as microcrystals and then adsorbing onto the surface of the crystals to prevent them growing into scale. Corrosion inhibitors work by preventing either or both of the half cell reactions from proceeding. For external processes which remove the impurities, the problem of disposing of them still remains. Sludge from settling tanks, backwash water from filters, and regenerant streams from ion exchange units all contain a high concentration of the impurities that the unit was removing. These effluents have to be disposed of, and this may well create a whole new field of problems to be considered. (Baker-FRC)

DESIGN AND FABRICATION OF A LOW COST PACKAGE WATER TREATMENT PLANT FOR RURAL AREAS IN INDIA,

Visvesvaraya Regional Coll. of Engineering, Nagpur (India). Dept. of Public Health Engineering.
A. G. Bhole.
Aqua, No 5, p 315-320, 1981. 10 Fig, 5 Tab, 18 Ref.

Descriptors: *Developing countries, Package plants, *Rural areas, *India, *Water treatment facilities, Design criteria, Pebble bed flocculators, Flocculation, Plate settlers, Settling tanks, Filtration, Chlorination.

A low cost package plant for treating surface waters is presented. Its operation requires no mechanical equipment or electric power except for a diesel pump. The plant does not need a skilled operator, because it is simple to operate and maintain. The design includes an alum dosing unit (large plastic bucket), a tapered pebble bed flocculator which subjects the water flow to decreasing velocity gradients, plate settlers (require one tenth the detention time of conventional clarifiers), a rapid sand filter unit, and a bleaching powder chlorination unit (plastic bucket). The plant, which costs about 1150 pounds sterling, may be easily transported to the desired site. Design for this plant was based on a population of 1000 using 90 liters per hour per day, raw water with average turbidity of 100 NTU, and operation for 8 hours a day initially. (Cassar-FRC)

NEW TECHNIQUES TO REMOVE RADON FROM GROUND WATER.

Water Well Journal, Vol 35, No 11, p 16, 18, November, 1981.

Descriptors: *Groundwater, *Water treatment, Activated carbon, Drinking water, *Well water, *Potable water, Carbon, Adsorbents, Aeration, *Radon removal, Radioactivity.

Two methods have been developed for removing the radioactive gas radon from well water. These methods are thought to be 95% or more effective. The two methods, granular activated carbon adsorption and diffused aeration, have been incorporated into commercial units that may be installed in homes at reasonable costs. The methods are augmented by a third process developed by the state, called spray aeration. The activated carbon unit is really nothing more than a commercially available home water softener unit in which the water softening resin is replaced with granular activated carbon. The carbon will remain effective over an indefinite period of time, a priod of years. The diffusion aeration method involves a 40-gallon pressure tank in which a ceramic diffuser creates fine air bubbles in the water. The clean air from the atmosphere in the bubbles will strip the radon from the water; the gas is then vented from the house and released harmlessly into the atmosphere. (Baker-FRC)

PHYSIOCHEMICAL SPECIATION OF LEAD IN DRINKING WATER,

Lancaster Univ. Bailrigg (England). Dept. of Envirnomental Sciences.
R. M. Harrison, and D. P. H. Laxen.
Nature (London), Vol 286, No 5775, p 791-793, August 21, 1980. 2 Tab, 16 Ref.

Descriptors: *Drinking water, *Lead, *Speciation, *Heavy metals, Metals, Physical properties, Chemical properties, Solubility, Plumbing, Water conveyance, Pipes, Flushing.

The speciation of lead was investigated in two tapwater samples consisting of morning first draw water and in one sample taken after thorough flushing of the pipes. The first two samples came from a house in Glasgow with a lead-lined tank and lead piping and a house in Bentham with internal copper piping but a lead service pipe; the sample after flushing came from the University of Lancaster, which had copper piping with high-lead soldered capillary joints. The University sample had a total lead concentration of only 3.3 nanograms per milliliter, most of which was filterable. The water supply for the University had a substantial organic content and showed considerable capacity to complex lead, which was lost following ultraviolet irradiation of the sample water. In the Bentham sample, where the water supply has a low organic content, 53 percent of the lead and 33 percent of the copper were associated with colloidal particles of between 0.015 and 1.0 micrometers, while 19 percent of the lead was in colloids between 1 and 12 micrometers. The Glasgow sample contained the highest concentrations of total lead, most of which was associated with colloidal size fractions between 0.015 and 0.08 micrometers. The three samples each appeared to have little or no free ionic lead. Lead in these samples did not appear to be the result of particles flaking off the basic lead carbonate lining of lead water pipes. Since the solubility of the plumbing depends on the adsorption and complexation capacity of the hydrous oxides and organic complexing agents in the water supply, techniques to control this solvency depend on increasing the pH of the water and its hardness/alkalinity. INACTIVATION OF ENTEROVIRUSES BY OZONE,

Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
D. Roy, R. S. Engelbrecht, P. K. Y. Wong, and E. S. K. Chian.
Water Science and Technology, Vol 13, No 2, p 819-836, 1981. 11 Fig, 44 Ref.

Descriptors: *Disinfection, *Viruses, *Ozone, Laboratory studies, Water treatment, Wastewater treatment, Kinetics, Microbiological studies, Temperature effects, Hydrogen ion concentration, Mass transfer, Poliovirus, *Enteroviruses.

The effects of pH, temperature, and residual ozone concentration on the inactivation of poliovirus 1 (Mahoney) were studied using a precisely controlled continuous flow reactor. With other parameters constant, the rate of viral inactivation increased as residual ozone increased between 0.1 and 0.2 mg/1 (O.1, 0.12, 0.15, and 0.21 mg/1 at pH 7.2 and 20 C). Inactivation at a given ozone level was rapid during the initial contact period (up to about 25 sec), then slower to the end of the experiment (140 sec). Viral inactivation was greater at high pH (7.2) than at low pH (4.3 or 5.9). The shape of the survival curve at pH 4.3 suggested that increased resistance to ozone at high pH was due to inherent properties of the virus and was not the result of increased aggregation of the viral particles. The percentage inactivation increased with temperature at the three levels tested (5, 10, and 20 C). Calculation of the activation energy for ozone disinfection (3.6 kcal) from the temperature experiments indicated that mass transfer of ozone into the viral particle, rather than the chemical reaction rate, was the rate-limiting element in viral inactivation. The all-or-none effect reported by previous researchers was notably absent in all the experiments, and thus has probably been a result of experimental error. (Carroll-FRC)

EMERGENCY WATER SUPPLY GENERAL REPORT NO. 2, CONCEPT FOR AN EMERGENCY WATER SUPPLY IN SWITZERLAND,

Waterworks, Zurich (Switzerland).
M. Schalekamp.
Aqua, No 4, p 8-14, April, 1980. 16 Fig.

Descriptors: *Disasters, *Water supply systems, *Protection, Nuclear explosions, Electromagnetic waves, Water scarcity, Water storage, Water distribution, *Switzerland.

Switzerland has plans for assuring a water supply in case of catastrophe such as sabotage, natural disaster, war, or nuclear destruction. Water requirements per person per day are three liters for Stage 1 (first three days), 5-15 liters for Stage Two (to the end of the third month), and 25-100 liters during Stage Three (the reconstruction period lasting another nine months). For Stage One supplies, water is being packaged in plastic containers, good for five years storage. For Stage Two, 110 emergency supply points are set up to draw groundwater and spring water. The third stage water supplies will come from three pumping stations built to withstand nuclear attack, electromagnetic pulse (EMP) from nuclear explosions, and other disasters. Protection against EMP is obtained by encasing the whole building in a Faraday's cage, a metal sheath at least three mm thick. RFI doors are used at entrances. Power cables are equipped with excess voltage conductors and must respond seven to ten times faster than normal lightning conductors. Undisclosed security measures to prevent unauthorized entry are also in force. (Cassar-FRC)

FLUORIDE DETERMINATION IN WATER: AN OPTIMUM BUFFER SYSTEM FOR USE WITH THE FLUORIDE-SELECTIVE ELECTRODE,

University of Strathclyde, Glasgow (Scotland). Dept. of Applied Geology.
K. Nicholson, and E. J. Duff.
Analytical Letters, Vol 14, No 7, p 493-517, 1981. 1 Fig, 7 Tab, 21 Ref.

Descriptors: *Fluoride, *Water analysis, *Ion-selective electrodes, Reproducibility, *Drinking water, Performance evaluation, Water quality.

Methods used for the determination of fluoride in water analysis were investigated to ensure that the methods were sufficiently sensitive and reproducible for routine use, as long as there is strict control of fluoride levels in fluoridated water supplies. Eleven buffered systems were examined, and maximum complexing ability with optimum reproducibility and sensitivity were determined. Tisab III M.-triammonium citrate was the best of the eleven systems in terms of masking ability. Only Al and Mg pose interference problems. For full decomplexing capacity of the buffer to be exploited, a minimum decomplexing time of 20 minutes, preferably 24 hr, after buffer addition is required. The masking ability and stability of the complex formed by the buffer deteriorates on storage. Buffers should be discarded after two weeks of storage. (Small-FRC)

UPDATING ANTIQUATED CITY WATER SYSTEMS,

Bogert (Clinton) Associates, Fort Lee, NJ.
W. Wheeler.
Consulting Engineer (St Joseph), Vol 57, No 3, p 101-105, September, 1981, 3 Fig.

Descriptors: *Water supply, *Utility extension, *Water shortage, Water distribution, *Water supply systems, Filtration, Water treatment, Lynn, Massachusetts, Newark, New Jersey, Pipes, Water mains, Pumping plants, Reservoirs, Planning, Maintenance.

The process of expanding old city water systems is illustrated by two examples. In Lynn, Massachusetts, the water supply for this 6800 acre city was insufficient and of poor quality after the droughts of the 1960's. The first phase improvements involved the high service distribution system: pipe cleaning and lining, redistribution of water by installation of valves, and installation of parallel pipes. Pilot plant studies indicated that rapid coagulation-direct filtration would be most suitable and cost effective for a proposed treatment plant. Two 3-million gal storage tanks were built. In the low service distribution system, 60-year old pipes were cleaned and relined with cement. Daily average demand was calculated at 15.5 mgd, but safe yield from existing facilities was only 12.5 mgd. Improvements in pumping capacity and impoundments increased the yield to 17 mgd. An eventual 30 mgd was accounted for in the design. A similar staged program is planned for Newark, New Jersey, to improve the water supply and distribtion system, which is awaiting construction. This consists of a rapid coagulation-direct filtration system with initial 94 mgd capacity and ultimate 136 mgd capacity. A major interconnection project will combine the supply systems of Jersey City, Newark, and the Passaic Valley. (Cassar-FRC)

AN INTEGRATED MESH-NODAL METHOD FOR STEADY-STATE WATER DISTRIBUTION NETWORK ANALYSIS,

Victoria Univ. of Manchester (England). Power Systems Lab.
K. R. Stimson, and A. Brameller.
Journal of the Institution of Water Engineers and Scientists, Vol 35, No 2, p 186-187, March, 1981.

Descriptors: *Water distribution, *Systems analysis, Computers, Networks, Computer programs, Algorithms, Mathematical studies, *Water supply systems.

An abstract was formulated of an algorithm and computer program for steady-state analysis of water distribution networks. The algorithm is designed as a mesh method, but is solved by techniques common to nodal methods to produce a fast, reliable, and efficient solution. The inclusion of pumps and control valves and the ability to determine the status of the control valves are also useful. Pumps are modeled as pseudo-pipes, using a given characteristic equation. Pressure reducing valves, pressure sustaining valves, and non-return valves are modeled according to their status. They are modeled in terms of nodes, fixed head nodes, and pseudo-pipes to ensure consistency with the basic formulation. In particular a sub-algorithm is used to determine the status of a control valve when that status is not initially known or is uncertain. The program has been tested on real and hypothetical networks of up to 1600 nodes/2500 pipes with good convergence in every case. This fast analysis method is applicable for interactive simulation and design of water distribution networks. (Baker-FRC)

A CENTURY OF WATER FOR ANTWERP,

Antwerpse Waterwerken (Belgium).
I. J. Dirickx.
Aqua, No 3, p 10-13, 1981. 1 Tab.

Descriptors: *Utilities, *History, Water treatment, *Antwerp, Belgium, Public utility districts, *Water supply, *Water distribution.

Although the City of Antwerp recognized a need for public water treatment works as early as the cholera epidemic of 1866, it was not successful in establishing a system until 1881, when 7,000 subscribers consuming 2.3 million cu meters a year were served. The distribution system slowly expanded to the 1980 level of 124 million cu meters of water per year and 142,000 subscribers. The water is abstracted from the Albert Canal or the Nete Canal and enters five large storage reservoirs with a total capacity of 2.7 million cu meters. Treatment plants include Notmeir-Walem (165,000 cu meters per day): alum treatment aeration, and sand filtration; Notmeir (220,000 cu meters per day): chlorination, alum and activated silica, dual bed filtration, ozonation, and activated carbon treatment; and Oelegem (135,000 cu meters per day): pumping and purification. 5G. Water Quality Control

THE AGRICULTURAL IMPACT OF WATER QUALITY STANDARDS: A MATHEMATICAL PROGRAMMING APPROACH,

R. A. Solove.
PhD Dissertation, 1980. 211 p, 2 Fig, 17 Tab, 83 Ref, 3 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-25397.

Descriptors: *Water quality control, *Agricultural runoff, *Mathematical models, Cost analysis, Nutrients, Water pollution, Economic aspects, Social values, Pollution taxes, *Florida, Everglades Agricultural Area.

High levels of nutrient pollutants enter water runoff into Lake Okeechobee and the Conservation Areas from the South Florida Everglades Agricultural Area. Lowering the level of nitrogen and phosphorus into these areas will result in both benefits and costs, with expected differential distributive effects across affected groups. Federal and State laws mandating a correction to this externality problem will be associated with varying costs of compliance to the agricultural sector, depending on the specific form of regulation implemented. An agricultural sector, multi-product, price equilibrium mode, which introduces risk into the decision process, was chosen as the tool of analysis. The model allowed achievement of a standard by readjusting crop growing seasons, readjusting water tables, changing relative cropping patterns, and/or readjusting the relative intensity of production in the different subregions. The effluent tax system gave the least reduction in the various social value measures. Compared to the direct regulation approach, the effluent tax yielded nearly $1 M more net farm income at low water quality standards increasing to $32 M at high restriction levels. Results indicate that the effluent tax system may be the least costly method for achieving water quality standards in the Everglades Agricultural Area, increasing in efficiency as standards are made more severe. The implementation, enforcement, monitoring, and transactions costs of various regulatory policies would have to be considered before a charge or tax policy is adopted. (Sinha-OEIS)

LINERS OF NATURAL POROUS MATERIALS TO MINIMIZE POLLUTANT MIGRATION,

Arizona Agricultural Experiment Station, Tucson.
W. H. Fuller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-221863, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-122, July, 1981. 5 p, 2 Fig, 2 Tab. R 803988.

Descriptors: *Water pollution prevention, *Linings, *Leachates, *Landfills, Metals, Total organic carbon, Groundwater pollution, Municipal wastes, Solid wastes.

When landfills are not completely impermeable, then underlying groundwater may be contaminated by leachate constituents if these are not adequately retained by soils between the landfill and groundwater. The relative effectiveness of natural low-cost liners, including crushed limestone, clayey soil, hydrous oxides of iron, and crushed pecan hulls, for minimizing the migration of beryllium, cadmium, chromium, iron, nickel, zinc, and total organic carbon constituents of municipal solid waste landfill leachates was investigated in the laboratory. Layers of crushed limestone retarded movement of contaminants through soil. Iron hydrous oxide applied as iron rust was an effective barrier, retarding movement of contaminants so that they appeared much later in effluents. Waste ferrous sulfate treated soils likewise retained metals from leachate, but increased levels of iron were noted in column effluents. There was a significant positive correlation between amounts of iron, manganese and aluminum hydrous oxides in soils and attenuation of metals by these soils. The composition of municipal solid waste leachate exercises a profound influence on retention of metals. Barriers of crushed pecan hulls do not cause retention of sufficient amounts of heavy metals to warrant the effort and expense involved in placement of such barriers. (Moore-SRC)

USING COHERENT WATER JETS TO CONTROL OIL SPILLS,

Mason and Hanger-Silas Mason Co., Inc., Leonardo, NJ.
M. K. Breslin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-232720, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-141. August, 1981. 6 p, 1 Tab. 68-03-2642.

Descriptors: *Oil spills, *Cleanup operations, *Water pollution control, *Jets, Wave action, Water currents, Entrainment, Oil pollution, Oil slicks, Water jets.

The ability of coherent water streams to induce a surface current in a body of water and thus control a floating oil slick was examined in a number of test programs. The objective of the tests was to determine whether coherent water streams could serve as an alternative to fabric booms and water sprays in concentrating, diverting, and containing oil slicks. The water jets were constructed from standard pipefittings and supplied with water from common centrifugal water pumps. The jets were mounted at one of three location; some on the main test tank towing bridge, others onto small floats, and others extending from the bow of a catamaran. Control of oil slicks in 6-knot currents, with water jets, was evaluated by towing the jets with the bridge system at 6 knots. Coherent jets could induce a significant surface current and move an oil slick with litle oil entrainment. Nonbreaking waves produced by a wave generator did not greatly affect performance, except where the jet nozzles were cantilevered off the front of the catamaran and the pitch of the vessel caused significant changes in the height and attitude of the jet outlet. The best position for an unmanned water jet of the sizes and at the pressures tested was determined to be vertically directed at the surface of the water with the outlet 0.4 to 1.0 m above the surface. The vertical component of the coherent water stream was as useful, if not more so, as the horizontal component. (Moore-SRC)

COMBINED SEWER OVERFLOW ABATEMENT PROGRAM, ROCHESTER, N.Y. - VOLUME I. ABATEMENT ANALYSIS,

O'Brien and Gere Engineers, Inc., Syracuse, NY.
F. J. Drehwing, C. B. Murphy, Jr., D. J. Carleo, and T. A. Jordan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-219602, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-113, July, 1981. 4 p. Y-005141.

Descriptors: *Water pollution control, *Combined sewer overflows, *Nonstructural alternatives, *Model studies, *Cost-benefit analysis, Storm water, Water quality management, Storm runoff, Wastewater treatment, *Rochester, New York.

In response to the transient water quality problems induced by periodic overflows from the Rochester Pure Waters District's combined sewer system, a project was undertaken to develop an abatement and management program necessary to achieve a cost effective solution to the combined sewer overflow (CSO) induced impairment of the Genessee River, Irondequoit Bay, and Lake Ontario. The USEPA Stormwater Management Model - Version II, Simplified Stormwater Model, and receiving water models were used to evaluate various CSO pollution abatement alternatives. Nonstructural, minimal structural, and structurally intensive alternatives were defined and evaluated by these models. The nonstructural approach applied Best Management Practices (BMP). Structural alternatives involved evaluation of conventional storage and treatment options. Cost benefit analyses of all structurally intensive alternatives were conducted using optimum treatment process train configurations developed from pilot plant evaluations. Preliminary analysis of BMP and minimal structural alternatives indicated that by addressing the major sources of pollution and by eliminating throttling constraints within the existing sewerage system, a substantial decrease in the total annual load of contaminants to the receiving waters from rainfall induced CSO can be achieved for relatively small capital expenditures. Those measures can be initiated within a short period of time, thereby immediately reducing pollution to the receiving waters, while long term design and construction of more structurally intensive alternatives are undertaken. (Moore-SRC)

THE DEVELOPMENT OF WATER QUALITY MANAGEMENT PLANS USING DATA FROM AUTOMATIC STORMWATER MONITORING NETWORKS,

Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
T. J. Grizzard, J. P. Hartigan, and C. W. Randall.
Water Science and Technology, Vol 13, No 8, p 95-102, 1981. 6 Fig, 11 Ref.

Descriptors: Data collections, *Mathematical models, *Water quality management, *Stormwater, *Nonpoint pollution sources, Network design, Networks, Multireservoir networks, Hydrologic data collections, Data processing, Model studies, Water pollution prevention, Water pollution control, Pollution load, *Occoquan Watershed, Virginia.

Data bases constructed at a micro- and macrowatershed in the Occoquan Watershed, Virginia, were used to develop a mathematical model for use as a water quality management aid. This nonpoint pollution source approach provides separate data sets for the necessary calibration and verification studies. Periodic testing of model predictions was carried out through on-going macro-basin data collection to expand the utility of the automatic stormwater monitoring network data base. Thus, the model is equipped to reflect pollution loadings from changing land use patterns. Based on model predictions for present and future land use impacts, the governmental divisions drained by the Occoquan River basin implemented a basinwide nonpoint pollution management program in 1978. This multijurisdictional advisory program depended upon annual reviews of monitoring data and model predictions to calculate cumulative water quality impacts and local reforms in the field of nonpoint water pollution control. (Geiger-FRC)

1981 REPORT ON GREAT LAKES WATER QUALITY, APPENDIX GREAT LAKES SURVEILLANCE.

International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Water Quality Board.
November, 1981. 174 p. 31 Fig, 77 Tab.

Descriptors: *Water quality, *Water quality management, *Water quality standards, Lake basins, *Eutrophication, Phosphorus, Fisheries, DDT, Toxicity, Degradation, Contamination, Biological oxygen demand, Effluents, Environmental protection, Trout, Alewife, *Toxins, Herring, *Great Lakes.

In this 1981 report the major issues are accelerated eutrophication of the Great Lakes and toxic materials in the ecosystem. Eutrophication impairs recreation, water supply, fishing, and destroys wildlife. Phosphorus was the primary nutrient considered and its control could significantly impede or reverse the eutrophication process. Some success in phosphorus control has been noted, and has resulted in improved drinking water quality, improved recreational use, and some changes in the composition and abundance of fish populations. Total phosphorus levels in Lake Erie's western basin have declined because of decreased loadings from the Detroit River. There has been a possible species change in the phytoplankton as oligotrophic indicator species are more abundant, while the eutrophic species (Scenedesmus spp.) have declined. Total phosphorus levels in Lake Ontario changed little between 1979 and 1980 but a general decline in the last decade is evident. Lake Michigan's total phosphorus levels have been correlated with ice cover vs. year-to-year changes in phosphorus loading. Monitoring programs and surveillance studies in 1980 also revealed the following: DDT and PCBs have declined in bloater chubs and herring gull eggs in Lake Michigan, while dieldrin levels in chubs have increased; the Lake Superior Basin area showed elevated levels of toxaphene in trout but declines in PCBs, DDT, and dieldrin; and dioxin levels in Lake Ontario have been decreasing (from over 1,000 ng/g to under 60 ng/g) over the past ten years. Coordination of surveillance activities needs to be improved and should include the application of resources to priority issues rather than to general basin monitoring. (Atkins-Omniplan)

1981 REPORT ON GREAT LAKES WATER QUALITY.

International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Water Quality Board.
1981. 74 p. 2 Fig, 3 Tab.

Descriptors: *Water quality, *Water quality management, *Water quality standards, Water pollution control, Effluent limitations, Phosphorus, Pulp and paper industry, Operating policies, Eutrophication, Degradation, Contamination, Biological oxygen demand, Effluents, Environmental protection, *Great Lakes, *Toxins.

The Great Lakes Water Quality Board annually reviews and evaluates the environmental quality of the lakes and the progress made in implementing programs required by the 1978 Great Lakes Water Quality Agreement. This report makes recommendations concerning toxic substances, control programs, phosphorus inputs, the pulp and paper industry, and resources commitments. There is no specific management strategy for directing toxic substances activities. The Board recommends sixteen specific measures to abate toxic health and environmental threats, including establishing inventories of toxic substances and their characteristics, establishing monitoring programs, planning hazard and risk assessment programs, and implementing control programs. Phosphorus removal at municipal treatment plants, in conjunction with limitations on the phosphorus content in detergents, has resulted in an average phosphorus effluent limitation of 1.0 mg/L at all Lower Lakes facilities—a goal not expected to have been met until 1986. The pulp and paper industry has also made progress in reducing its loading of BOD and suspended solids into the lakes. Environmental quality problems may be local, lakewide, or systemwide. The Board has identified 39 areas of concern divided into two categories: areas with significant degradation (Class A) and those with impaired use (Class B). There is a discussion of eutrophication and the contaminants in each lake. Progress has been made in implementing the Agreements's programs, but for continued progress resources must be committed in a cost-effective manner according to the priorities that the Board has established. (Atkins-Omniplan)

TOXIC SUBSTANCES CONTROL PROGRAMS IN THE GREAT LAKES BASIN.

International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Water Quality Board.
1981. 94 p. 1 Fig, 6 Tab, 1 Append.

Descriptors: *Lakes, *Water quality control, *Water quality standards, *Ecosystems, *Toxicity, Environmental policy, Policy making, International agreements, Chemical wastes, Hazards, Assessments, *Great Lakes basin.

Annex 12 of the 1978 Great Lakes Water Quality Agreement calls for programs to inventory toxic substances, to coordinate air, water and solid waste control programs, and for joint programs to manage hazardous materials. The Toxic Substances Committee established a framework of four basic components to evaluate the toxic substances program management. The first component, an information base, includes source inventories, characteristics of toxic substances, and environmental measurements on actual incidence and accumulation of specific chemical substances. The second element is hazard and risk assessment to decide which chemicals should be most closely monitored and which ones are most likely to cause adverse effects in humans and other environmental sectors. The third component is a set of programs to control the release of toxic substances into the environment, and the fourth is a methodology to evaluate the program's effectiveness and identify any changes or adjustments to the management program. The underlying problem identified by the Committee is the absence of an overall Great Lakes ecosystem strategy for toxic substances control activities that are carried out under various jurisdictions and various pieces of legislation. This fragmentation has caused duplication of effort in

some areas, no coverage in others, and an overall limited management capacity. The U.S. and Canada are working toward a more coordinated effort but since the programs are just developing, the extent to which they will be able to effectively coordinate the toxic substances programs remains to be seen. A full description of the programs, the agencies implementing them, and their objectives is in an appendix. (Atkins-Omniplan)
W82-03103

REPORT OF THE AQUATIC ECOSYSTEM OBJECTIVES COMMITTEE,

International Joint Commission-United States and Canada, Windsor (Ontario). Great Lakes Science Advisory Board.
November, 1981. 48 p, 7 Tab, 75 Ref, 1 Append.

Descriptors: *Lakes, *Water quality control, *Water quality standards, *Selenium, *Ecosystems, Toxicity, Fish populations, Drinking water, Water pollution effects, Lake sediments, Fish diets, International agreements, *Great Lakes.

The Aquatic Ecosystem Objectives Committee (AEOC) is responsible for keeping current Annex 1 of the 1978 Great Lakes Water Quality Agreement. In 1980, the Committee recommended that concentrations of total selenium in unfiltered water samples not exceed one microgram/liter to protect aquatic life, concentrations in sediments not exceed five micrograms/gram dry weight to protect aquatic life, and that concentrations in aquatic biota not exceed three micrograms/gram wet weight for predatory fish and mammal protection. Recent studies have confirmed the acute lethality of waterborne selenium to fish; however, dietary selenium may be even more toxic. Water consumed by humans rarely constitutes a health hazard. The AEOC also reconfirmed that mirex and its degradation products should be undetectable in water and aquatic organisms to protect aquatic organisms, fish-consuming birds and animals. The best detection levels for mirex are 0.005 micrograms/liter for water and 0.005 micrograms/gram for biological tissues. The Committee also made recommendations relative to limited use zones, mixing zones, problem areas and/or areas of concern. Mixing zones are the physical expression of water quality objectives and represent within the zone a loss of beneficial use, and, at the edge of the zone, the maximum limit of that loss. Merely identifying a problem area does not describe the extent, severity or significance of the problem and abdicates responsibility for actively limiting its impact. This report outlines the considerations required to formulate mixing zone objectives and the mechanics of establishing a mixing zone. Needs to be considered for 1981-82 are also listed. PARAMETRIC MODEL AND OPTIMAL PREDICTION OF THE AVERAGE SALINITY OF THE AZOV SEA,

Academiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
V. E. Prival'skii.
Water Resources, Vol 7, No 4, p 321-333, July/August, 1980. 4 Fig, 3 Tab, 13 Ref. Translated from Vodnye Resursy, No 4, p 40-54, July/August, 1980.

Descriptors: *Salinity, *Water consumption, *Water management, *Azov Sea, USSR, Model studies, Prediction, Monte Carlo method, Mathematical models, Planning, Ecological effects, *Water quality control.

Nonreturnable water consumption in the Azov Sea basin has increased salinity in the sea from the desired 9.5-11 parts per thousand to 13.9 parts per thousand in 1976. Effective implementation of water-management measures requires a model for predicting average salinity under application of the management variants. A model to predict the salinity on the basis of nonreturnable withdrawals and additional delivery of fresh water was developed and tested. For nonreturnable withdrawals of 25.5 km per year in 2000, salinity would be about 17 parts per thousand, increasing to 19 parts per thousand by 2010. (Cassar-FRC)
W82-03154

NEW THRUST IN THE 1980S FOR U.S. WATER-QUALITY PROGRAMS,

Civil Engineering (New York), Vol 50, No 9, p 78-81, September, 1980.

Descriptors: *Water quality, *Policy making, Administration, Standards, Regulations, Water quality standards, Human disease, *Water pollution control.

Changes expected in the water quality program of the United States for the 1980s are discussed. In the 1970s major concern was demonstrated for surface waters such as rivers and lakes. Groundwater and small lakes were for the most part neglected. Now concern over ground water contamination is causing a re-thinking in priorities for the 80s. Progress has been made in controlling point-source pollution. A major problem in this area, however, remains with the municipalities and their low rate of compliance with regulations. Non-point source pollution, however, has been more difficult than point source pollution to control. Controlling turbidity or chemicals entering river water that flows through an area of numerous farms has proven hard to handle in that the source cannot be so readily determined and in many cases is not a single source at all. An important change in thinking has occurred as the move was made away from ambient water quality standards to some kind of technology-based effluent standards. Public opinion is also shifting from the desire to have clean water in the lakes for the sake of healthy fish to the idea that clean water in lakes is healthy for humans. (Baker-FRC)

RIVER CLEAN-UP PLAN DEVELOPED WITH CITIZENS AND INDUSTRY,

Fox Valley Water Quality Planning Agency, Neenah, WI.
H. J. Day, W. Elman, D. Theiler, and R. Christianson.
Civil Engineering (New York), Vol 50, No 3, p 78-81, March, 1980. 2 Fig.

Descriptors: *Water quality management, *Public participation, *Industrial wastes, Planning, Alternative planning, *Fox River, *Wisconsin, Pulp and paper industry, Water pollution prevention, Water pollution control, Political aspects, Model studies, Dissolved oxygen, Waste treatment, Low-flow augmentation, Instream aeration, Rivers.

Citizens, state environmental planners, and paper industry representatives have worked together to plan pollution abatement for the lower Fox River, Wisconsin, formerly one of the ten most polluted rivers in the U.S. Organic wastes have been reduced by 90% and final cleanup to meet Clean Water Act standards is in the planning stage. The first step was formation of the Fox Valley Water Quality Planning Agency, comprising three citizens'groups. The second step identified point source pollution and provided for modeling of the river's dissolved oxygen profile. A daily average dissolved oxygen standard of 5.5-6.2 ppm was chosen. An allowable discharge was set for each municipal and industrial discharger. It was decided to use the full assimilative capacity of the river as long as the required water quality standard is maintained. This permits tailor-made discharges but requires more complex stream monitoring and management. Stream management alternatives under consideration are end-of-pipe treatment, low-flow augmentation, and instream aeration. Outfall relocation and instream alteration (removing dams) were rejected as alternatives. (Cassar-FRC)

DETOXIFICATION OF ZINC AND CADMIUM BY THE FRESHWATER PROTOZOAN TETRAHYMENA PYRIFORMIS. II. GROWTH EXPERIMENTS AND ULTRASTRUCTURAL STUDIES ON SEQUESTRATION OF HEAVY METALS,

Queen Elizabeth Coll., London (England). Dept. of Biology.
S. Dunlop, and G. Chapman.
Environmental Research, Vol 24, No 2, p 264-274, 1981. 4 Fig, 3 Tab, 22 Ref.

Descriptors: *Protozoa, *Heavy metals, Zinc, Cadmium, Industrial wastes, Aquatic animals, *Detoxification, Decontamination.

Cells of Tetrahymena pyriformis (strain W) were exposed to various concentrations of zinc and cadmium. While 120 ppm zinc or 4 ppm cadmium killed the cells, they survived in 60 ppm zinc or 2 ppm cadmium. The sublethal concentrations of zinc and cadmium limited the cumulative effect of growth as shown by reduced cell numbers. Zinc and cadmium suppressed cell division initially. Zinc-treated cultures recovered somewhat. Growth rates in the cadmium treated cultures were between only 18% and 58% of the controls, giving low cell densities at 40 hr. A slow recovery was noted hereafter. Low zinc (6 ppm) or low cadmium (2 ppm) concentrations did not greatly alter growth characteristics. Zinc at 6 ppm partly annulled the detrimental effect of 2 ppm cadmium. Ultrastructural observations and electron-probe analysis showed that zinc induced the formation of many cytoplasmic granules into which the metal was sequestered and thereby detoxicated. Cadmium was more widely distributed throughout the cells and therefore inflicted more damage. (Baker-FRC)

A LARGE INTERATIONAL RIVER: THE DANUBE,

Vizgazdalkodasi Tudomanyos Kutato Intezet, Budapest (Hungary). Inst. for Water Pollution Control.
P. Benedek, and F. Laszlo.
Water Science and Technology, Vol 13, No 3, p 61-76, 1981. 8 Fig, 2 Tab, 11 Ref.

Descriptors: *Water quality control, *River basins, *International agreements, Water pollution control, Water management, *Danube River, Rivers, Heavy metals, Self-purification, Bottom sediments, Wastewater disposal, Budapest, Hungary, Water policy, International waters.

The Danube, flowing through eight European countries, is a multipurpose use river of vital importance for 70 million inhabitants. The navigation aspect will increase in the 1980's with the opening of the Rhine-Maine-Danube navigational canal. The Danube, which is suitable for drinking water purposes with simple treatment over almost the entire 2800 km length, is used for hydropower, drinking water, and cooling water. It provides 70% of surface water sources in Hungary, which lies entirely within the Danube basin. Downstream of Budapest, water quality has shown deterioration with increasing levels of Hg, Cd, lubricating oil, and lignin-sulfonic acid. Fortunately, the bank-filtered wells are still of good quality, and bottom sediment analysis shows non-serious levels of heavy metals. Self-purification improves the water quality so that it enters Yugoslavia with a lighter pollutant load. Proposed sewage treatment plants at Budapest and Vienna are expected to improve the water futher. Rapid industrialization and population growth require a comprehensive monitoring and water quality control program on an international scale. (Cassar-FRC)

REMOVAL OF OIL POLLUTANTS FROM WATER BODIES BY MEANS OF HYDROPHOBIC SORBENTS,
Akademiya Nauk SSSR, Moscow. Inst. Okeanologii.
M. P. Nesterova, N. M. Anufrieva, A. B. Goritskii, L. M. Shuter, and R. M. Verlinskaya.
Water Resources (English Translation), Vol 7, No 4, p 375-379, July-August, 1980. 2 Tab, 19 Ref. Translated from Vodnye Resursy, No 4, p 156-160, July-August, 1980.

Descriptors: *Water pollution control, *Sorption, *Oil spills, Oil pollution, Water treatment, Sawdust, Perlite.

Hydrophobic sorbents for cleaning up oil spills in surface waters were prepared from perlite or sawdust mixed with dimethyl formaldehyde resin and a latex copolymer of divinyl and methyl methacrylate in a heated vessel, followed by filtration and drying at 100C. Field tests of the products in barriers floating in the Black Sea showed that hydrophobic expanded perlite and dry pine sawdust removed the oil from the water's surface to a degree of 98.5 and 98.2%, respectively, using a sorbent:oil ratio of 1:2. The same conditions, applied to diesel oil removal, produced similar results. Increasing the ratio of sorbent to fuel to 1:1 improved removal to 99.88%. (Cassar-FRC)

THE RIVER RHINE–TRANS-NATIONAL RIVER BASIN MANAGEMENT DEVELOPING PROGRAMME TO MEET NEW CHALLENGES,
Nordrhein-Westfalen Landesamt fur Wasser und Abfall, Dusseldorf (Germany, F.R.).
H. Massing.
Water Science and Technology, Vol 13, No 3, p 77-91, 1981. 2 Fig, 1 Tab, 24 Ref.

Descriptors: *Water quality control, *International agreements, River basins, Water pollution control, *Rhine River, Federal Republic of Germany, Water law, Oil pollution, Legal aspects, Water policy, Industrial wastes, Rivers, Self-purification, Water transport, *Industrial wastes.

The Rhine River and its tributaries, flowing through 10 European countries, have been used for centuries for navigation, drinking, and more recently for industry, cooling water, hydropower, irrigation, wastewater discharge, fishing, and recreation. The 1975 status map gives an indication of water quality. Upstream of Lake Constance, the Alp-Rhine water is moderately loaded, Class II. In the High Rhine and Upper Rhine, quality alternates between Class II and Class III, critically loaded. Recovery takes place in the mountains, and Class II-III again prevails until the beginning of the Lower Rhine. Heavy industry and municipal discharges produce heavily, very heavily, and excessively polluted water which exists until the border of Germany and the Netherlands, where it is again Class II-III. Although some improvement in water quality has occurred during the 1970's, further corrective steps are necessary. Control measures, based on the attitude that the drinking water supply is of first importance, are in operation, including treatment of combined sewage overflows, international agreements, and national regulations on discharge of wastewater and individual pollutants, closed cooling systems for power plants, regulation of pollution by ships, artificial aeration, and computerized emission information processing. IN-STREAM AERATION: A POSSIBLE ALTERNATIVE TO AWT,
Civil Engineering (New York), Vol 50, No 3, p 81-82, March, 1980. 1 Fig.

Descriptors: *Instream aeration, *Aeration, *Advanced wastewater treatment, Fish, Aquatic life, Wastewater treatment, Fox River, Wisconsin, Dissolved oxygen, Oxygenation, Water pollution control.

Instream aeration could achieve the required dissolved oxygen levels in the Fox River, Wisconsin, for an estimated annual cost of $120,000 compared with the $10 million anual cost of additional advanced wastewater treatment. Sidestream pressurization using liquid oxygen is being considered for this river. Advantages include a high transfer rate and an uncluttered surface that would not interfere with recreational boating. There are several unknowns in this field: the effects of aeration on fish and on fish spawning places and the effects of reduced buoyancy. One instream aeration station has been in operation in the Chicago Metropolitan Sanitary District. It pumps diffused air through carborundum plates at the waterway bottom. (Cassar-FRC)

VACUUM SEWERS–THE FUTURE FOR SEWAGE COLLECTION,
Willis, Cunliffe, Tait and Delcan, New Westminister (British Columbia).
F. R. King.
Civil Engineering (New York), Vol 51, No 12, p 54-55, December, 1981. 1 Fig.

Descriptors: *Wastewater collection, *Sewers, *Vacuum sewers, Bridgeview, *British Columbia, Sewage collection.

Vacuum sewage collection was the most feasible alternative for Bridgeview, near Vancouver, British Columbia. Located in a flood plain rich in peat, the town had serious sewage contamination from septic tanks and raw sewage leaks. The project, completed in 1980, was 30% cheaper than any other alternative. It included the vacuum collecting network, 2 collecting stations, drainage improvements, installation of ductile iron water mains in place of old wooden mains, and elimination of septic tanks. 6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

A 'RANDOM WALK' SOLUTE TRANSPORT MODEL FOR SELECTED GROUNDWATER QUALITY EVALUATIONS,
Illinois State Water Survey Div., Champaign.
T. A. Prickett, T. G. Naymik, and C. G. Lonnquist.
Bulletin 65, 1981. 103 p. 68 Fig, 3 Tab, 18 Ref.

Descriptors: Groundwater, *Groundwater movement, Groundwater quality, *Solute transport, *Model studies, *Computer programs, Case studies, Aquifers, Plumes, Groundwater contamination, Finite difference methods, Water pollution, Evaluation, *Surface-groundwater relations.

A generalized computer code is given that can simulate a large class of solute transport problems in groundwater. The effects of convection, dispersion, and chemical reactions are included. The solutions for groundwater flow include a finite difference formulation. The solute transport portion of the code is based on a particle-in-a-cell technique for the convective mechanisms, and a random-walk technique for the dispersion effects. The code can simulate one- or two-dimensional nonsteady/steady flow problems in heterogeneous aquifers under water table and/or artesian or leaky artesian conditions. The program covers time-varying pumpage or injection by wells, natural or artificial recharge, the flow relationships of water exchange between surface waters and groundwater, the process of groundwater evapotranspiration, the mechanism of possible conversion of storage coefficients from artesian to water table conditions, and the flow from springs. It also allows specification of chemical constituent concentrations of any segment of the model. Further features of the program include variable finite difference grid sizes and printouts of input data, time series of heads, sequential plots of solute concentration distributions, concentrations of water flowing into sinks, and the effects of dispersion and dilution or mixing of waters having various solute concentrations.

OPTIMAL OPERATING POLICIES FOR WATER SUPPLY AND DISTRIBUTION SYSTEMS,
California Univ., Los Angeles.
J. R. VanWinkle.
PhD Dissertation, 1980. 149 p, 27 Fig, 1 Tab, 34 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-16055.

Descriptors: *Water supply, *Water distribution, *Water management, Mathematical studies, Operating policies, Operating costs, Economic aspects, *Inglewood, California.

A method of optimizing the operating policy of a water supply and distribution system using mixed binary programming is presented. The operating policy consists of a set of specific control actions including water treatment levels, the selection of alternative water sources and the determination of pumping schedules which specify the pump flow rates and the timing of the pumping operations. Nonlinear relationships such as the pump characteristic curves and aquifer draw-down are modeled by a linearization technique. A second degree polynominal equation is derived for these nonlinear relationships, and a variable transformation yields a set of equations that are similar in structure to the linearized energy balance equations. These transformed variables are then determined iteratively, in the same manner as the flow rates in the water distribution network. The method was applied to the water supply and distribution system of the City of Inglewood, California. The optimal operating policy developed for this water system resulted in a 13% reduction in operating costs. The case study demonstrated the validity of the method and its rapid convergence towards a balanced solution. (Sinha-OEIS)

NODAL DOMAIN INTEGRATION MODEL OF UNSATURATED TWO-DIMENSIONAL SOIL-WATER FLOW: DEVELOPMENT,
California Univ., Irvine. Dept. of Civil Engineering.
T. V. Hromadka, G. L. Guymon, and G. C. Pardoen.
Water Resources Research, Vol 17, No 5, p 1425-1430, October, 1981. 7 Fig, 8 Ref.

Descriptors: *Soil water, *Model studies, Flow, Mathematical studies, Unsaturated flow, Soil moisture, *Flow characteristics, Computer programs, Numerical analysis, Comparison studies.

A basic description of the nodal domain integration procedure is provided, as applied to the class of partial differential equations generally encountered in the theory of unsaturated groundwater flow. Another objective was to develop a numerical statement which represents the finite element Galerkin statement, subdomain numerical statement, finite difference integrated control volume statement, and the nodal domain integration statement by specifying a single parameter in the resulting triangular element matrix system. The resulting statement involves the same computational requirements as does the Galerkin finite element procedure. Thus computer programs may be prepared based on the nodal domain integration procedure, which inherently contains the Galerkin finite element, subdomain, and finite difference techniques. A powerful method of comparing the accuracy of various numerical techniques is provided which eliminates uncertainty of effects between codes used for comparison. The so-called nodal domain integration method theoretically contains all numerical subsets in addition to those derived. For

example, the method would include linear basis function approximations of higher order basis functions. The method proposed in this paper can be extended to include the case where a single computational problem can be allowed to select a spatially and temporarily varying n function to achieve optimal spatial accuracy. RELIABILITY PROGRAMING IN RESERVOIR MANAGEMENT 1. SINGLE MULTIPURPOSE RESERVOIR,

California Univ., Davis. Dept. of Civil Engineering.
S. P. Simonovic, and M. A. Marino.
Water Resources Research, Vol 16, No 5, p 844-848, October, 1980. 3 Tab, 3 Fig, 5 Ref.

Descriptors: *Reservoir operation, *Reservoir construction, *Reservoirs, *Statistical analysis, *Mathematical models, Reservoir releases, Multipurpose reservoirs, Algorithms, Optimization, Systems analysis, Cost-benefit analysis.

Reliability programming was applied to a single multipurpose reservoir to determine the maximum difference between net benefits and yearly risk losses. Constraints include the probabilities of not exceeding specified limits of storage and inequalities which represent constraints on releases and reliability. The input data consist of sequences of monthly inflow, municipal and industrial water demands, and sequences of monthly irrigation demand. The frequency distribution functions of inflows and irrigation demands are obtained by fitting the data with a Pearson type 3 distribution function. A two-dimensional Fibonacci search procedure was developed as a solution algorithm. However, for a larger number of risk variable, this algorithm would not be economical. (Titus-FRC)

REGIONAL MULTIOBJECTIVE PLANNING OF WATER SUPPLY AND THE DISPOSAL OF RESIDUALS WITH DUE REGARD TO INTRAREGIONAL POPULATION DISTRIBUTION,

National Inst. for Environmental Studies, Ibaraki (Japan).
Y. Kitabatake, T. Miyazaki, and M. Takahashi.
Environment and Planning A, Vol 12, No 6, p 627-648, June, 1980. 9 Fig, 16 Tab, 18 Ref.

Descriptors: *Water supply, *Population density, *Regional planning, Model studies, Planning, Long-term planning, *Multiobjective planning, Urban planning, Waste disposal, Wastewater treatment, Water quality control, Economic aspects, *Tokyo, Japan, Land use, Costs, Water management.

A model is developed to determine the optimum intraregional population distribution for managing water supply and disposal of residuals. The resulting information is helpful in long-term planning for developing regions. The three objectives of the model are considered in hierarchical order: first, maximum water quality; then, maximum land quality; and finally, minimum economic cost. The three constraints are total population of the several subregions (to be distributed among the subregions), governmental resources (capital and labor), and water intake at the water supply plant necessary to provide a given water quality. The model is applied to the Tama River basin in the Tokyo Metropolitan area. The study region consists of 15 cities, 4 towns, and a 1976 population of 1,711,298. Results show that the most important objective, water quality, determines the spatial allocation of waste disposal activities and that the economic cost factor influences the spatial arrangement of the population. CALCULATOR PROGRAM AIDS LAGOON DESIGN,

Gutierrez-Palmenberg, Inc., Phoenix, AZ.
R. E. Palmenberg.
Water/Engineering and Management, Vol 128, No 10, p 49-52, 1981. 3 Fig, 2 Tab.

Descriptors: *Lagoons, *Design criteria, Computers, Planning, Decision making, Ponds, Construction.

A program has been developed which gives a trial and error solution to earthwork volumes for lagoons. The program was written for programmable calculators. The program provides the depth of cut, cut volume, fill volume, and net earthwork volume for the balanced cut and fill construction approach. A procedure was worked out for an actual case for two lagoons sharing a common center embankment. The single lagoon and multiple lagoon cases are easily derived from the two-lagoon case and have been left to the reader to develop. The balance cut and fill earthwork calculation represents a good starting point for estimating earthwork quantities for the construction of earthen lagoons. There are several assumptions in the method, including the existence of level ground on the site, that all material excavated in the cut is suitable for use in construction of embankments, and that the lagoons have a rectangular geometry without allowance for large radius curves in corners. It is possible to apply the balanced cut and fill method to obtain a rapid estimate of earthwork quantities and cut depths for the two-lagoon system. (Baker-FRC)

RELIABILITY PROGRAMMING IN RESERVOIR MANAGEMENT 2. RISK-LOSS FUNCTIONS,

Institut za Vodoprivredu Jaroslav Cerni, Belgrade (Yugoslavia).
S. P. Simonovic, and M. A. Marino.
Water Resources Research, Vol 17, No 4, p 822-826, August, 1981. 6 Fig, 4 Tab, 11 Ref.

Descriptors: *Reservoir operation, *Risks, *Flood damage, *Drought, Reservoir releases, Economic aspects, Water supply, Water shortage, Reliability programming, Blue Marsh Reservoir, Pennsylvania, Multipurpose reservoirs.

A method for deriving risk-loss functions associated with floods and droughts was determined from existing hydrologic, hydraulic, and economic data using a reliability programming approach. First, a relationship was established between the amount of water excess or shortage and its corresponding reliability level (risk-quantity relations). Second, the excesses or shortages were related to damages (quantity-loss relations). The results of these two steps are combined to form the risk-loss relation. Both flood and water supply risk-loss functions were determined for the Blue Marsh Reservoir, Schuylkill River basin, Pennsylvania, a multipurpose reservoir built for flood control and municipal water supply. This method, concerned only with economic efficiency, does not include loss of life during floods. Necessary input data for calculating the flood risk-loss function are initial reservoir storage, reservoir capacity, water demands from the reservoir pool, reservoir losses, distribution function of the reservoir inflows, convoluted sums of the cumulative distribution functions of reservoir inflows, and reservoir releases (target releases). Necessary input data for determining the water supply risk-loss functions are initial reservoir storage, reservoir capacity, water supply storage, water demands from the reservoir pool, reservoir losses, convoluted sums of the cumulative distribution functions of reservoir inflows, reservoir releases (target releases), average annual water demand for water supply, cumulative distribution functions of streamflow at the intake, and shortage-loss relationships. This approach can also be used in developing the risk-loss functions associated with other reservoir uses: recreation, navigation, and water quality enhancement. (Cassar-FRC)

THE COMPUTER: WATER MANAGEMENT TOOL,

Camp, Dresser and McKee, Inc., Clearwater, FL.
R. N. Armstrong, and R. S. Taylor.
Consulting Engineer (St. Joseph), Vol 57, No 3, p 97-100, September, 1981.

Descriptors: *Computer models, *Planning, *Water management, Model studies, Water supply, Water pollution effects, Water shortage, Wells, Combined sewer overflows, Cross Bar Ranch well field, Florida.

Computer models are being used effectively for water supply management. They are effective in prediction, planning, and monitoring supplies; in simulation of the water cycle; in predicting effects of drought, pollution, and salt water intrusion; and in evaluating the role of socioeconomic factors. Several examples of innovative computer modeling for water resources management are described. In Florida the Cross Bar Ranch well field near Tampa Bay was designed, developed, monitored, and managed by computer to ultimately yield 30 mgd for average demand and 45 mgd for peak demand without violating regulations or damaging the aquifer. Water demand and economic impacts of water restrictions were studied in the Metropolitan Washington, D.C. area. Computer analyses of many variables in population, employment, housing, user type, etc. allowed formulation of an effective water management program for this area. Computer models are also used in studying combined sewer overflows, river flows, flood control alternatives, and basic data on the Chesapeake Bay and its tributaries. (Cassar-FRC)

MODERN MANAGEMENT TECHNIQUES, PART II A: CASE HISTORY OF PRODUCTION IMPROVEMENT,

LWFW, Inc., Dallas, TX.
G. S. Thompson, and T. G. McCoy.
Water/Engineering and Management, Vol 128, No 3, p 88-89, 100, March, 1981. 8 Fig.

Descriptors: *Management planning, *Sewer systems, *Water conveyance, Performance evaluation, Economic aspects, Political aspects, Mechanical equipment, Needs assessment, Productivity, Wastewater managment.

An outside consultant was hired to conduct an operation audit of the field operations group of the water and sewer utilities department of a major Texas city in order to obtain an objective review of productive levels, to design and implement a management reporting system that would include productivity performance reporting, and to ensure that the best available management techniques were being used by the field operations group. Initial activities included interviews with key management and supervisory personnel and detailed field observations of the work crews. Later activities included review of planning, scheduling, and reporting functions. Detailed analyses of crew time in the water and sewer construction section revealed severe work imbalances, resulting in low job site productivity. The acquisition of larger back-hoe equipment was recommended and implemented, resulting in productivity improvements between 75 and 90 percent. Analysis and optimization of the size and number of dump trucks used at each site resulted in truck utilization of 83 percent and backhoe utilization of 100 percent, compared to 100 percent and 50 percent, respectively, prior to the evaluation. (Carroll-FRC)

MODERN MANAGEMENT TECHNIQUES, PART I: NEED FOR, AND IMPORTANCE OF, PRODUCTIVITY IMPROVEMENT,

LWFW, Inc., Dallas, TX.
G. S. Thompson, and T. G. McCoy.

Water/Engineering and Management, Vol 128, No 2, p 52-54, 64, February, 1981. 2 Ref.

Descriptors: *Water treatment facilities, *Management planning, *Productivity, Labor, Wastewater management, Sewer systems, Supervisory control, Operating policies, Decision making, Administration, Utilities.

Problems caused by declining productivity in the public sector become manifest through increased costs of service, declining service levels, and inability to adequately maintain and replace existing capital systems and equipment. When planning productivity improvements in the field operations area of water and sewer utilities, it is first necessary to define productivity and to determine who in the organization can implement its improvement. Labor productivity should be the major focus, since field operations activities are labor intensive and because labor productivity can be significantly influenced by management action. Major factors affecting field operations productivity include work methods, scheduling, materials availability, equipment, proper management information, tactical planning, and strategic planning. Because of the importance and complexity of productivity in this area, its improvement requires the best available management techniques, including productivity performance reporting as an integral part of a management information system, the use of the critical success factors approach to organizational design and management, and periodic operations audits. Productivity performance reporting is the reporting through all levels of supervision and management of the productivity of each segment of the operation. Critical success factors are those important factors requiring special management attention. Individuals should be charged with accountability for each of the identified factors. Operations audits provide a tool for focusing on the review of the operation as a whole, for evaluating the effects of management actions on productivity, and for early identification of problem areas. ALTERNATIVE COSTS AND TOTAL ECONOMIC BENEFITS: AN INPUT-OUTPUT STUDY OF THE ASWAN DAM (EGYPT),
Northeastern Univ., Boston, MA. Dept. of Economics.
M. E. S. Abdel Rahman.
PhD Dissertation, July, 1980. 163 p, 25 Tab, 62 Ref, 3 Append. University Microfilms International, Ann Arbor, MI; Order No GAZ81-07001.

Descriptors: *Economic aspects, *Model studies, *Cost-benefit analysis, *Dams, Electric power, Irrigation, *Aswan Dam, Egypt.

This study empirically assesses the alternative costs and total (direct and indirect) economic benefits of the Aswan Dam to the Egyptian economy. The chief analytical tool is a static version of Leontief's Input-Output model. The alternative costs are the net drain on the economy of using other methods to produce an amount equal in value to the electrical power and agricultural output made possible by the water supply of the Dam. The estimated alternative costs show the Dam to be a very efficient source of electric power and of water for irrigating additional land and hence to be economically justified in these terms alone. The total benefits encompass the expected increase in the demand for the Dam's extra electric power and agricultural production. The total benefits from the additional electricity can be analyzed in terms of the increases in domestic sector's output, employment, and contribution to the balance of payments position of the country. National policy implications of the study are that the Aswan Dam is the basis for future economic development in Egypt. If the maximum benefits of its electric power are to be realized, Egypt's development policy should emphasize the allocation of the country's limited investment funds to the creation and/or expansion of a 'growth industry' in each of the economy's key processing sectors with the strongest forward linkages. These sectors are found to be: chemicals; food processing; spinning and weaving; iron and steel. Two other key primary sectors should continue to be developed, namely transportation and agriculture. COST-BENEFIT ANALYSIS OF THE EUPHRATES DAM,
Norfolk State Univ., VA.
N. Samman.
Water Suply and Management, Vol 5, No 4/5, p 331-338, 1981. 1 Fig, 1 Tab, 29 Ref.

Descriptors: *Dams, *Decision making, Management, Planning, *Euphrates Dam, *Syria, *Euphrates river, Rivers, Dam construction, Construction, Irrigation, *Cost-benefit analysis, Economic aspects, Cost analysis, Multipurpose reservoirs.

In Syria, the economy is primarily agricultural. Agricultural production varies due to the annual rainfall, which at present is only 350 mm/year. However, an abundance of natural water resources are available for agricultural use. A dam was constructed across the Euphrates River in 1975 and has increased actual and potential irrigation in the river basin. With completion of the dam, irrigation objectives of 640,000 hectares can be developed over the next 20-30 years in the Euphrates Basin. Considering the costs and benefits of the project involves making certain assumptions. First, the project life is 35 years, even though the economic benefits extend to a century. Secondly the social infrastructure costs associated with farmer resettlement in the project area, including public buildings, roads and public utilities are not imputable to the project, as these facilities have to be provided by the government with or without the project. Third, the investment stream in the economic analysis comprises the following five items: initial fixed investment, investment imputable to the project, operation and maintenance costs, investment for removal of appropriate items which depreciate, and annual costs at the farm level. Fourth, the social opportunity cost of family labor was assumed to be zero. Analysis revealed that the project was economically sound and justified its priority consideration by the Syrian Government. However, it also seemed that the project will not transform the Syrian economy to the extent expected by the planners. (Baker-FRC)

ESTIMATING THE COSTS IN LOST POWER OF ALTERNATIVE SNAKE-COLUMBIA BASIN MANAGEMENT POLICIES,
Sandia National Labs., Albuquerque, NM.
R. J. Hanson, and C. B. Millham.
Water Resources Research, Vol 17, No 5, p 1293-1303, October, 1981. 3 Fig, 6 Ref.

Descriptors: *Cost analysis, *Model studies, Benefits, *Water management, Water use, Water resources development, Basins, Watersheds, Powerplants, Project planning, Alternative planning, *Snake River basin, *Columbia River basin.

Competition exists between optimal hydropower generation on the one hand, and recreation, fisheries, navigation and irrigation on the other. Specific questions resulting from this conflict deal with the costs of replacing hydropower lost under alternative basin management schemes designed to benefit uses other than power generation. A 51 dam, 56 time period long range simulation model of the hydropower system in the Snake-Columbia basin, including projects on those two rivers and on major tributaries thereof is presented. The model is then applied to study a series of alternative basin management scenarios, and the consequences in lost power of these scenarios are evaluated economically. Efficiency in this model was achieved using 'French Curve' cubic spline data fits together with fast pointers to carefully define data structures. Care was taken to couch the model in a setting making it accessible to use by nonprogramers. It was concluded that competition between power production and other uses of the basin's water can be expected to increase as energy shortages increase. Trade-offs between power production and the other uses and interests must be evaluated and decisions made as to which interests to favor. The results given herein are linear in terms of changes in costs for either base-load or peaking. For example, an error of two mills in peaking costs would result in a change of about $4,000,000, for a deficit of 3000 megawatt-months. The power deficits, in megawatt months, are felt to be reasonably good estimates. There is some room for discussion of the split between baseload and peaking. (Baker-FRC)

Descriptors: *Cost-benefit analysis, *Irrigation water, *Groundwater irrigation, *Irrigation operation, *Thailand, Water distribution, Feasibility studies, Pipes, Economic aspects, Water resources development, Development countries.

A cost-benefit analysis of a groundwater irrigation water development project in northern Thailand indicated that the project is economically feasible. It is designed to provide water for dry season cropping. Major products are soybeans, mung beans, maize, groundnuts, cotton, rice, vegetables, fruits, and sugar cane. Benefit-cost ratios for two cropping patterns were 1.42 and 1.35 (financial) and 1.94 and 2.07 (economic with selective shadow pricing). Underground PVC pipes are more economical than a lined open ditch system if the ditches must be redone four times over the project life. (Cassar-FRC)

AN ECONOMIC ANALYSIS OF WATER CONSERVATION POLICY,
Rutgers - The State Univ., New Brunswick, NJ.
W. Whipple, Jr.
Water Resources Bulletin, Vol 17, No 5, p 814-819, October, 1981. 2 Fig, 1 Tab, 14 Ref.

Descriptors: *Water conservation, *Drought, *Economic evaluation, Water demand, Water supply, Water resources, New Jersey, Water policy, Water reuse, Water prices, Groundwater management.

Disagreement is expressed with Federal policies which encourage water conservation as an end in itself. Although water conservation in drought situations is advantageous and often necessary, it is not a substitute for improved structural systems. Water conservation should be used only when the value of the water saved exceeds the cost of pro-

ducing the savings. A community can be caught unprepared for drought or growth in water demand if it relies on conservation measures during normal rainfall. This policy applies where water is a renewable resource, not where groundwater is mined, such as the Ogallala Aquifer, the Tucson basin, and the Libyan desert. New Jersey is used in an example of an economic analysis. (Cassar-FRC)

Water Resources Bulletin, Vol 17, No 5, p 844-850, October, 1981. 7 Fig, 5 Tab, 11 Ref.

Descriptors: *Water demand, Water price, *Agriculture, *Irrigation, Water consumption, *Water cost, Water conservation, Water use, Prices, Crop yield, Model studies, Elasticity of demand, Groundwater irrigation, Surface water, Land use.

The effects of varying prices of surface and groundwater on agricultural land use patterns were determined by normative analysis. Using four levels of prices for both surface water and groundwater and ignoring constraints such as subsidies and water rights, the model produced different amounts of water used and different mixes of crops, livestock, and production technology for each price level. At the highest water prices (4 times 1975 prices for both surface water and groundwater) total water demand is half that of the 1975 base level; irrigated acreage is reduced to 8.4 million from 19.6 million. In practice, marginal dryland regions would be added to the total dryland cropping area. Although irrigated crop yields are reduced and commodity shadow prices are increased by up to 15% at the high water prices, total agricultural production would remain somewhat constant. (Cassar-FRC)

WHO WILL PAY THE WORLD'S WATER BILL,
Earthscan, London (England).
J. Tinker.
Aqua, No 3, p 17-20, 1981.

Descriptors: *Developing countries, *Water supply development, International Drinking Water Supply and Sanitation Decade, Water policy, Costs, Planning, Financing, Public health, Rural areas.

A minimum of $300 billion total or $80 million a day is required to meet the goals of the International Drinking Water Supply and Sanitation Decade by 1990. Although agencies and governments are highly in favor of the project, money will apparently come from reducing expenditures in agriculture, health, education, etc. Progress varies according to the country and depends on motivation. For example, Bangladesh expects to reach its 100% coverage goal by 1985, having already sunk half a million tubewells and supplied 70% of the people with a hand pump within 200 meters of their homes. (Cassar-FRC)

THE GEZIRA SCHEME–A STUDY IN FAILURE,
N. Pollard.
Ecologist, Vol 11, No 1, p 21-31, January-February, 1981. 1 Fig, 117 Footnotes.

Descriptors: *Social impact, *Human diseases, *Irrigation, Water resources development, Gezira, *Sudan, Cotton, Water management, Agriculture, Developing countries, Environmental effects.

Water resources were developed for irrigation of cotton in the Gezira region, Sudan, starting with the construction of the Sennar dam and canals in 1914. The project has increased in incidence of waterborne disease and disrupted the cultural life of the population without producing much economic gain. Schistosomiasis, malaria, and yellow fever became major problems. Byssinosis affected many cotton gin workers. Simple irrigation has been in use here since 3000 B. C. Before British colonial intervention the population lived in balance with the environment. The family unit and the Muslim religion were the basis of cultural stability. Cotton had been grown, spun, and woven in family units. This practice declined as cotton was sent directly to gins. Land was divided into small plots of 12-16 hectares for working by tenant families. This was not successful because of burdensome government regulations on crop allocation and water management. Proceeds from the cotton crop rarely reach 100 pounds per tenant per year. Although the colonialists have left the area, the Gezira people have a legacy, a technology unsuitable for the cultural environment. (Cassar-FRC)

BETTER WAYS TO FINANCE STORMWATER MANAGEMENT,
Stormwater Consultants, Bolingbrook, IL.
H. G. Poertner.
Civil Engineering (New York), Vol 51, No 4, p 67-69, April, 1981. 2 Tab.

Descriptors: *User charges, *Storm water, *Urban runoff, Financing, Management, Utilities, Storm drains, Institutions, Storm runoff, Urban drainage, Runoff, Planning, Surface drainage, Surface runoff, Cities, Economics, Public utilities, Impervious soils, Legal aspects.

Annual losses and damages from surface runoff in the U.S. were estimated at $3 billion in 1978. Innovative financing methods are frequently needed for preventive and corrective programs. Some cities have adopted the user charge concept, which in Denver, Colorado, uses the ratio of impervious area to total area of a land parcel to determine the rate ($0.37 to $1.17) per 100 sq ft, billed annually, needed to raise $4.7 million a year. Other cities charge according to amount of impervious area or according to land use. The separate stormwater utility is popular in many western U.S. cities. Before establishing any of these systems, legal and public relations efforts should be initiated. (Cassar-FRC)

MAJOR CHANGES AHEAD IN THE NATION'S WATER CLEAN-UP PROGRAM,
G. Dallaire.
Civil Engineering (New York), Vol 51, No 12, p 50-53, December, 1981.

Descriptors: *Grants, *Wastewater treatment, *Water pollution control, Water policy, Regulations, Federal jurisdiction, Construction costs, Water quality standards, Effluent standards, Utilities, Standards, Municipal wastewater, Secondary wastewater treatment, Financing, Water quality control.

Changes in federal policies indicate that the construction grants program will be discontinued. The Water Pollution Control Federation urges an orderly phaseout over 10 years to allow municipalities time to adjust to self-reliance. The wastewater treatment plants will have to operate as utilities, charging rates high enough to cover operation and maintenance costs plus replacement costs. With less federal money available officials must concentrate on projects probably in urban areas, which give the most benefit for the least cost. Effluent standards and water quality standards must also become more flexible, perhaps allowing a limited mixing zone in a receiving stream where dissolved oxygen would be permitted to fall to 3 mg per liter instead of 5 mg per liter. Such policies would prevent spending large amounts of money for very small improvements in water quality. Since $120 billion is needed for municipalities to meet the goal of fishable, swimmable waters throughout the U.S., it may be advisable to set up a priority system to first clean up important rivers rather than inadequately deal with many rivers. Policies toward ocean dumping and secondary treatment for effluents disposed of into the ocean may be relaxed. (Cassar-FRC)

6D. Water Demand

WATER RESOURCES APPRAISAL FOR HYDROELECTRIC LICENSING; PIGEON RIVER BASIN; NORTH CAROLINA, TENNESSEE,
Federal Energy Regulatory Commission, Washington, DC. Office of Electric Power Regulation.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-003537, Price codes: A03 in paper copy, A01 in microfiche. Federal Energy Regulatory Commission Report FERC-0087, September, 1981. 45 p, 8 Fig, 11 Tab.

Descriptors: *Water resources development, *River basin development, *Water demand, *Hydroelectric plants, Water quality, Streamflow, Recreation, Water supply, Water storage, Reservoirs, *Pigeon River basin, North Carolina, Tennessee, Licensing.

The Pigeon River basin extends generally northward from the western slopes of the mountains in the Pisgah National Forest in Haywood County, North Carolina, into Cocke County, Tennessee, where the Pigeon River flows into the French Broad River. The Pigeon River drains an area of 666 sq mi. The average annual precipitation is about 45 inches, and the average streamflow of the Pigeon River at its mouth is approximately 1,250 cfs. The area is predominantly agricultural, and sparsely populated. The 108,600 kw Walters hydroelectric project is the only utility generating facility in the basin. Champion Papers, Inc., operates a 51,000 kw industrial steam-electric facility in the upper reaches of the basin. The water resources of the basin have been developed to provide a moderate amount of hydroelectric power with small incidental flood control, municipal and industrial water supplies, and limited fishing and recreation. There are no navigational facilities in the basin. The Walters project consists of a reservoir, dam, and powerplant connected to the reservoir by a 6.2 mi penstock tunnel. The 340-acre reservoir, Waterville Lake, has a total storage capacity of 25,000 acre-ft. Hydroelectric power development potential exists at two sites in the basin, but these projects have not been evaluated for economic feasibility. The Walters project, for which an application for a new license is pending, is in good condition and continued operation of the project appears to be economically justified and would have little impact on the environment. (Moore-SRC)
W82-03039

WATER RESOURCES APPRAISALS FOR HYDROELECTRIC LICENSING; CAPE FEAR RIVER BASIN; NORTH CAROLINA - SOUTH CAROLINA,
Federal Energy Regulatory Commission, Washington, DC. Office of Electric Power Regulation.
M. Maslia.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-003334, Price codes: A02 in paper copy, A01 in microfiche. Federal Energy Regulatory Commission Report FERC-0088, September, 1981. 14 p, 2 Fig, 7 Tab.

Descriptors: *Water resources development, *River basin development, *Water demand, *Hydroelectric plants, Cooling water, Powerplants, Flood control, Navigation, Nuclear powerplants, Thermal powerplants, *Cape Fear River basin, North Carolina, South Carolina, Licensing.

The Cape Fear River basin covers a drainage area of 8,570 sq mi, and this report also includes 1,814 sq mi of the coastal area between the Neuse and Pee-Dee River basins. The average annual rainfall over the basin is about 48 inches. The maximum flow at Lillington is 150,000 cfs, while the minimum flow is 11 cfs. There is one existing Federal flood control project in the basin, and 35 retired

hydroelectric projects. Navigation facilities consist of three channels and three locks and dams. There are two fossil-fueled steam-electric generating plants and one nuclear-fueled steam-electric generating plant operating in the basin; all three use the Cape Fear River as their source of cooling water. The estimated 1977 total cooling water withdrawn was 153 MGD and the estimated consumption was 6 MGD. There is substantial undeveloped hydroelectric power potential in the basin. Potential hydroelectric projects with an existing dam would provide 50,296 kw of additional hydroelectric capacity. Potential hydroelectric projects with no present development at the site would provide more than 144,372 kw of additional hydroelectric capacity. Hydroelectric power development potential also exists at the retired projects. (Moore-SRC)
W82-03040

WATER RESOURCES APPRAISALS FOR HYDROELECTRIC LICENSING; MERRIMACK RIVER BASIN; NEW HAMPSHIRE, MASSACHUSETTS,

Federal Energy Regulatory Commission, New York. New York Regional Office.
P. Valeri.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-00356, Price codes: A02 in paper copy, A01 in microfiche. Federal Energy Regulatory Commission Report FERC-0091, September, 1981. 21 p, 2 Fig, 7 Tab.

Descriptors: *Water resources development, *River basin development, *Hydroelectric plants, Licensing, *Water demand, Eutrophication, Water quality, Water storage, Flood control, *Merrimack River basin, New Hampshire, Massachusetts.

The Merrimack River basin is located in south-central New Hampshire and north-eastern Massachusetts, and drains 5,010 sq mi. The average annual precipitation in the basin is 43 inches. The average annual flow of the Merrimack River at Lowell, Massachusetts is 7,480 cfs. The economy of the basin is based largely on manufacturing and service industries. Many segments of the Merrimack River and its tributaries have been seriously polluted, and lake eutrophication is a basinwide problem. There are about 458,000 acre-ft of usable water storage capacity. Five major flood control reservoir projects with a total storage capacity of 370,000 acre-ft have been constructed in the New Hampshire portion of the basin. There are 22 existing hydroelectric plants operating in the basin, with a total installed capacity of 58,048 kw. There are also two steam-electric, three internal combustion, and two combustion turbine generating plants in the basin. There are 46 hydroelectric sites in the basin with a total potential capacity of 323,871 kw, and five existing developments having a potential of increasing their capacity by 51,900 kw. Construction of the new Lawrence powerplant and the proposed Lowell powerplant will provide a total of 29,800 kw. The development of 14 new sites would account for 212,544 kw. Rehabilitation of 25 retired sites currently under license or preliminary permit action accounts for 29,627 kw of potential capacity. There are 389 known retired plants. (Moore-SRC)
W82-03041

WATER RESOURCES APPRAISALS FOR HYDROELECTRIC LICENSING; YADKIN-PEE DEE RIVER BASIN; NORTH CAROLINA, SOUTH CAROLINA, AND VIRGINIA,

Federal Energy Regulatory Commission, Washington, DC. Office of Electric Power Regulation.
H. D. Patrick.
Federal Energy Regulatory Commission Report FERC-0090, September, 1981. 15 p, 2 Fig, 6 Tab.

Descriptors: *Water resources development, *River basin development, *Water demand, Licensing, *Hydroelectric plants, Recreation, Consumptive water use, Cooling water, Water supply, Powerplants, Wild rivers, Wildlife, *Yadkin River basin, *Pee Dee River basin, North Carolina, South Carolina, Virginia.

The Yadkin-Pee Dee River basin covers approximately 17,890 sq mi in Virginia, North Carolina, and South Carolina. Precipitation averages about 47 inches per year over the basin. There are eight existing hydroelectric projects with a combined total capacity of 311,329 kw. In addition, there are 16 retired small hydro plants located in the basin. The W. Kerr Scott reservoir on the upper portion of the Yadkin River is the only existing Federal reservoir project in the basin. At present, the project has no power facilities. Water supply for domestic purposes, industry, and agriculture is a major resource use. Over 200 water supply systems have been identified in the basin, of which 60 use surface water. Previous recreational use of the basin has been limited, but the use of the basin for recreational and wildlife is expanding. There are five steam-electric plants which withdraw 1,020.7 MGD for cooling water use, of which 23.7 MGD is consumed. There are 25 potential hydroelectric power developments in the basin, with a total installed capacity of 467,922 kw. Demand for water by public water systems, industrial plants, and for irrigation is expected to rise from approximately 287 MGD at present to 625 MGD by 2010. Potential water supply projects include two dams in North Carolina. Certain segments of rivers within the Yadkin-Pee Dee River basin have been selected as having potential for further consideration for the National Wild and Scenic Rivers System. (Moore-SRC)
W82-03042

WATER RESOURCES APPRAISAL FOR HYDROELECTRIC LICENSING; PAYETTE RIVER BASIN, IDAHO.

Federal Energy Regulatory Commission, San Francisco, CA. San Francisco Regional Office.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-003535, Price codes: A03 in paper copy, A01 in microfiche. Federal Energy Regulatory Commission Report FERC-0089, September, 1981. 52 p, 6 Fig, 10 Tab, 10 Ref.

Descriptors: *River basin development, *Water demand, *Water resources development, *Hydroelectric plants, *Irrigation, Water storage, Reservoirs, Dams, Flood control, Pumped storage, Licensing, *Payette River basin, Idaho.

The Payette River basin is a major tributary of the Snake River draining about 3,240 sq mi in west central Idaho. The average streamflow of the Payette River near Payette is 3,078 cu ft/sec. Annual precipitation varies from 13 inches at Emmett to 22 inches at Cascade and 33 inches at Deadwood Dam. The population in the basin is estimated to increase from 33,427 to 41,962 during the period 1980-2000. There are only two existing hydroelectric developments in the basin: the 8,000 kw Black Canyon plant located downstream of Black Canyon Dam and the unlicensed 300 kw Cascade plant located about 1,000 ft downstream of Cascade Dam. A license has been issued for a 12,800 kw hydroelectric project to be located downstream from the Cascade Dam and Reservoir, replacing the existing powerplant. There are five existing water storage reservoirs, with an aggregate usable storage capacity of 912,000 acre-ft. In 1976 there were about 152,000 acres of irrigated cropland. An additional 10,000 acres of new irrigation development and 23,000 acres requiring supplemental irrigation water supply are proposed by the year 2000. The total potential undeveloped conventional hydroelectric capacity in the basin is estimated to be 1,270 mw. There are two potential pumped storage developments in the basin with an estimated capacity of 1,000 to 3,000 mw and 1,000 to 9,000 mw, respectively. Structural development for the exclusive purpose of flood control cannot be justified under existing evaluation criteria. (Moore-SRC)
W82-03043

WATER RESOURCES APPARISALS FOR HYDROELECTRIC LICENSING; ST. JOSEPH - KALAMAZOO RIVER BASIN; INDIANA - MICHIGAN,

Federal Energy Regulatory Commission, Chicago, IL. Chicago Regional Office.
T. P. Mabini.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-003333, Price codes: A02 in paper copy, A01 in microfiche. Federal Energy Regulatory Commission Report FERC-0093, September, 1981. 18 p, 4 Fig, 6 Tab.

Descriptors: *Water resources development, *River basin development, *Hydroelectric plants, Licensing, *Water use, Flood control, Cooling water, Wild rivers, Powerplants, Streamflow, *St. Joseph River basin, *Kalamazoo River basin, Indiana, Michigan.

The basin includes the drainage areas of the St. Joseph and the Kalamazoo Rivers, with a total area of 6,665 sq mi. Springs and small lakes sustain the flow of the St. Joseph River, and therefore it is not subject to extremely low flows. The streamflow, about 45 mi above Niles, Michigan, averages about 3,100 cu ft/s. The flow of the Kalamazoo River near Fennville, Michigan averages about 1,400 cu ft/s. There are about 15 hydroelectric projects in the basin, with a total installed capacity of 32,478 kw. There are six authorized navigation projects and one local flood control project in the basin. There are five steam-electric plants which rely on surface waters for condenser cooling. One undeveloped hydroelectric site and five developed sites have potential for capacity additions. There are numerous sites within the basin where hydropower was generated but operations have been suspended and the powerhouse either abandoned or removed. A portion of the Paw Paw River, beginning 2 mi downstream of the Berrien-Van Buren County line was studied for inclusion in the National Wild and Scenic Rivers system. The retired Paw Paw hydroelectric projected may be affected by the proposed inclusion. Projected cooling water needs for steam-electric generation decreased due to reduction of plant capacities utilizing once-through cooling systems and an increase of plants utilizing cooling tower systems. (Moore-SRC)
W82-03044

WATER RESOURCES APPRAISAL FOR HYDROELECTRIC LICENSING; YAMPA RIVER BASIN; COLORADO, WYOMING.

Federal Energy Regulatory Commission, San Francisco, CA. San Francisco Regional Office.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-003538, Price codes: A03 in paper copy, A01 in microfiche. Federal Energy Regulatory Commission Report FERC-0086, September, 1981. 51 p, 4 Fig, 5 Tab, 8 Ref.

Descriptors: *Water resources development, *River basin development, *Water damand, *Hydroelectric plants, Dams, Irrigation, Water supply, Cooling water, Powerplants, Reservoirs, Wild rivers, Coal mining, Oil shale, Licensing, *Yampa River basin, Colorado, Wyoming.

The Yampa River basin, encompassing approximately 9,530 sq mi, lies in the northwest corner of Colorado and southcentral part of Wyoming. The major use of water in the basin is irrigation. The municipal systems derive their water from the nearby stream or, in one case, from a ground water reservoir. The only significant industrial water use is for steam-electric generation. As a part of the Colorado River system, flows are subject to requirements imposed by the Upper Colorado basin compact of 1948. The six major reservoirs in the basin are used for irrigation, fishery, domestic consumption, and recreation. The Yampa River basin is undergoing substantial economic development, spurred mainly by the mining, transport and conversion of coal resources. If the oil shale industry develops in the area, large amounts of water would be needed for industrial and domestic purposes. The proposed Juniper-Cross Mountain project would consist of two separate hydroelectric developments, each having a dam, reservoir, powerplant, and associated facilities. The Juniper unit would have an installed capacity of 98,000 kw, while the Cross Mountain unit would have an installed capacity of 50,000 kw. Four additional potential conventional hydroelectric powersites have been identified in the basin. The combined installed capacity potential for these sites is less than 50 megawatts. The reach of the Yampa River within Dinosaur National Monument is being stud-

ied for inclusion in the National Wild and Scenic Rivers System. (Moore-SRC)

THE INPUT-OUTPUT WATER TRANSACTIONS MODEL OF SUPPLY AND DEMAND,

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
D. W. Hendricks, and R. W. Dehaan.
Water Supply and Management, Vol 5, No 4/5, p 317-330, 1981. 6 Fig, 1 Tab, 7 Ref.

Descriptors: *Water supply, *Model studies, *Water demand, Planning, Decision making, *Input-ouput analysis, Water supply systems, Case studies, South Platte Basin, Colorado.

This paper focuses on the basic guidelines for input-output water planning and the general application of the model in basin-wide planning. The major purposes are to demonstrate how a simple tabular display, the input-output water transactions table, can be constructed to represent a complex water system, and to indicate the utility of the table in water planning. The 1970 input-output table of the South Platte Basin depicts the system structure for innumerable transfers of water. These transfers give the 'fits' between the sources of supply and the demand sectors shown. The structure, implicit in the matrix, is formed by the water rights priorities and the commensurate physical facilities for water storage, conveyance, and distribution. The input-output table ties together all of the diverse components of a water resource system such that the relationships between the parts and the whole can be discerned. Such a display provides a framework for making judgments about alternative water supply alternatives in the context of political, environmental, and legal questions, as well as physical ones. It is, at the same time, a planning methodology and a core of information. (Baker-FRC)

ON WATER AVAILABILITY AND DEMAND IN NIGERIA,

Ibadan Univ. (Nigeria). Dept. of Geography.
J. O. Ayoade.
Water Supply and Management, Vol 5, No 4/5, p 361-372, 1981. 2 Fig, 8 Tab, 3 Ref.

Descriptors: *Water resources development, *Management planning, Resources development, Water quality, *Water supply development, River basin development, Decision making, Planning, Water demand, Water supply, *Nigeria.

A broad assessment of water resources in Nigeria is presented along with strategies for developing and managing the country's water resources to avert the danger of a serious water crisis in the future. Rainfall represents the gross water income of the country, and it is the ultimate source of water found in rivers, streams, ponds, lakes or wells. Rainfall is seasonal in its incidence all over the country, but the duration of the rainy season varies from about 10 months to about three months in specific regions. The country has three major watersheds. In terms of quality, most Nigeria rivers are generally turbid; they carry a high sediment load in suspension, particularly during the wet season. Unpolluted water is generally acidic and moderately hard. It is good for drinking and irrigation, though it must be purged of the suspended sediment load to make it potable, particularly during the rainy season. The chemical quality of much of Nigeria's groundwater is relatively high. Traditional means of water exploitation include direct collection of rainwater from roofs of buildings and extraction of water from spring streams, ponds and hand dug wells. The major problem in meeting water demands is that of development and management rather than of water availability. Efficient management is beset with problems, including finance, equipment, personnel and the institutional framework for managing water resources. These problems can only be solved by planning and wise use of resources based on sound knowledge of the nature and distribution of the nation's water resources potential. (Baker-FRC)

POLICIES AND GOALS FOR CALIFORNIA WATER MANAGEMENT: THE NEXT 20 YEARS.

California State Dept. of Water Resources, Sacramento; and the California State Water Resources Control Board, Sacramento.
Public Review Draft, Bulletin 4, June, 1981. 54 p, 13 Fig, 4 Tab.

Descriptors: *Water management, *Long-term planning, *Resources management, Groundwater management, *Comprehensive planning, *Project planning, *Water policy, Public policy, Water quality control, Water quality management, Projections, Regional planning, Regional development, *California.

Annual net water use in California is now about 29 million acre-feet. Drops in runoff and increased water transport costs have reduced the total usable surface water runoff to 26 million acre-feet per year from 71 million acre-feet. The California Water Resources Management Policy has been drawn up to guide federal, state, and local agencies to ensure that enough water of proper quality is available to meet the state's reasonable needs until the year 2000. The nine policy components are: (1) use of existing water resources before developing new sources; (2) consideration of water quality objectives as an integral part of water resources management; (3) encouragement of conjunctive water use and avoidance of ground water overdraft; (4) encouragement of water conservation; (5) encouragement of water reclamation and reuse; (6) control of point and nonpoint pollution sources; (7) enhancement of instream beneficial use; (8) control of floods by construction of facilities and by flood plain zoning, flood proofing and flood warning systems; and (9) encouragement of energy considerations as part of water resources planning. Present water supplies, along with authorized and proposed additions to the Central Valley Project and the State Water Project, will satisfy water needs in California until 2000 during years of normal and above-normal runoff, but local and regional water management agencies need to accelerate their efforts for more effective water management. More attention must be given to planning for water-short years, managing ground water supply and quality, protection of instream use, and monitoring 13 significant conflict areas in the state. (Garrison-Omniplan)

WATER SUPPLY IN DENMARK,

Copenhagen Water Supply (Denmark).
J. A. Husen.
Aqua, No 2, p 25, 26, 28, 1981. 1 Fig, 1 Tab.

Descriptors: *Water supply, *Groundwater budget, *Denmark, Groundwater management, Groundwater reservoirs, Wells, Boreholes, Irrigation, Potable water, *Groundwater availability.

While Denmark does not have any large rivers or inflowing watercourses, easy access to groundwater is possible almost everywhere. Thus the main part of the water supply is based on groundwater abstraction. Surface water is used only as a supplement in the area of the Capital. The average annual precipitation is 760 mm, and the average actual transpiration is estimated at about 410 mm per year, leaving about 350 mm per year for infiltration and run-off. Public water supply delivers less than half of the total consumption figure for the country. About 90% of the population are supplied from public water supplies organized either as municipal waterworks or as private cooperative waterworks owned by the consumers. About 3 million inhabitants are supplied from 150-200 municipal waterworks, for a total production of about 360 million cubic meters per year. Total consumption breaks down to about 63% for households and small firms, 27% to industry and about 10% to institutions. During recent years a special demand has risen for abstraction of groundwater for irrigation by drilling on individual farms. This has resulted in a considerable exploitation of the groundwater resource. For the country in general the groundwater resources are still sufficient, but careful planning of resources has been established, as it is necessary to keep a balance between standards of quality and quantity required and the effect on the environment. WATER: TOO MUCH, TOO LITTLE, TOO BAD,

Johns Hopkins Univ., Baltimore, MD. Dept. of Sanitary Engineering and Water Resources.
A. Wolman.
Consulting Engineer (St. Joseph), Vol 57, No 3, p 83-86, September, 1981. 3 Ref.

Descriptors: *Water reuse, *Water supply, *Planning, *Water management, Water conservation, Water transfer, Water resources development, Water demand, Water policy, Water shortage, Irrigation, Drip irrigation, Agriculture, Hydroelectric power, Floods, Drought, Industrial water, Wastewater, Future planning, Long-term planning, Political aspects, Social aspects, Municipal water.

A bird's-eye view of water resources points out the $160 billion investment in 60,000 water systems in the U.S., the low price ($1 or $2 per 1000 gal, residential use), and the problems of sufficient water at the desired locations. Agriculture, the largest user of water in the U.S. is rapidly adopting drip irrigation, especially in drier regions. Industry has traditionally used water according to availability. For example, steel making uses 5000 gal per ton of steel produced where water is in short supply and up to 50,000 gal per ton where ample cheap water is available. New plants and process modifications are increasingly designed to conserve water. Cooling water continues to be a high-volume use, and further research is needed to develop a technology for conservation in this application. With higher oil costs, hydropower is regaining favor and many inactive dams are being considered for retrofitting to produce power. Floods and droughts continue to plague planners, zoning officials, and government officials. Efforts to prepare for or prevent these disasters are often ineffective and last only as long as a threat is perceived. Measures which may conserve water now and for the future are: water reuse, wastewater reuse, more effective irrigation, estuarine impoundments, and desalination. Systems analysis, operations research, computer intelligence data, and automation are among the tools available for confronting the problems of water management. (Cassar-FRC)

WILL SYNFUEL DEVELOPMENT DRAIN THE WEST DRY,

CH2M/Hill, Denver, CO.
M. R. Stansbury, and J. E. Patten.
Consulting Engineer (St. Joseph), Vol 57, No 3, p 91-96, September, 1981. 2 Fig, 1 Tab.

Descriptors: *Water requirements, *Synthetic fuels, *Coal gasification, *Oil shale, Water users, Water conservation, Water allocation, Water consumption, Water transfer, Water deficit, Water demand, Water law, Water management, Water policy, Water resources development, Water rights, Water scarcity, Water supply, Fuel, Coal mining, Slurries.

Large scale development of synthetic fuels in the water-short western U.S. would require large volumes of water. Oil shale production uses water for processing spent shale, cooling, dust control, and irrigation of revegetated areas. An average of 8500 acre feet of water per year is required for a 50,000 barrel per day facility. Water sources for this oil shale producing region are the Green, White, Yampa, and Colorado Rivers. With proper management and development of water a moderate level of oil shale development could be sustained. Synthetic fuels from coal also have large water requirements, depending on the extraction and pyrolysis methods used (4000-9000) acre feet per year for a standard size 15,000-30,000 tons per day high Btu coal gasification plant; 13,000-15,000 acre feet per year for a low Btu plant, standard size; and 4000-15000 acre feet per year for coal liquefaction plants). Transport of coal slurries would require 15,000-20,000 acre feet of Wyoming water to move 30-40 million tons of coal to Louisiana, and the water would be lost to the source state. Energy developments in the Upper Missouri Basin have and will continue to affect the agricultural community via declining water tables and the like. Possible solutions to the water deficit are: wastewater recycling, conjunctive use of groundwater and surface waters, conservation and reuse of irrigation return flow, and interstate and interbasin transfers. To prevent water supply crises the synthetic fuels industry should be limited to a moderate level of development over a long period. (Cassar-FRC)

JERSEY DROUGHT HASTENS WATER SUPFLY PROJECT,
American Society of Civil Engineers, New York.
H. N. Tuvel.
Civil Engineering (New York), Vol 51, No 2, p 51-52, February, 1981. 1 Fig.

Descriptors: *Water supply development, *Water shortage, *Regional planning, *Drought, Water resources development, Water conveyance, Potential water supply, Planning, *New Jersey, Municipal water, Drinking water.

One of the areas of the northeastern United States hardest hit by water supply shortages in early 1981 is northern New Jersey, where a water emergency has been declared. Water suppliers and municipalities may impose penalties and fines for excess water usage. The Round Valley Reservoir, which is owned by the State of New Jersey, has about 75 percent of its water capacity available but is unable to relieve water suppliers in northern New Jersey due to the lack of interconnecting distribution systems. A comprehensive study of new sources of water supplies in the northeast was conducted in the late 1960s by the Army Corps of Engineers. However, no major water supply project in the Delaware River area was undertaken at that time, partially due to heavy rainfall and abundant water supplies in the seventies. The suppliers of water to northern New Jersey consist primarily of six purveyors, whose combined yields leave the area about 25 percent short of what is considered a safe yield. The mix of State, city, andprivately-owned purveyors with no central water planning and development agency with the authority to make resources development decisions resulted in the failure of the region to respond to the known need for additional water supplies. Although the North Jersey district Water Supply Commission is planning to build a new reservoir which will provide water to other purveyors, much of the current shortfall could have been avoided with adequate water resources management and development. 6E. Water Law and Institutions

THE EVOLUTION OF TEXAS WATER LAW AND THE IMPACT OF ADJUDICATION,
Texas Tech Univ., Lubbock. Dept. of Geography.
O. W. Templer.
Water Resources Bulletin, Vol 17, No 5, p 789-798, October, 1981. 5 Fig, 38 Ref.

Descriptors: *Water rights, *Adjudication procedure, *Riparian rights, *Texas, Legal aspects, *Water law, Institutional constraints, Irrigation water, Claims, Permits, Planning, Appropriation, Surface water, Water allocation, Water policy, Water management.

Texas' water law was first influenced by Hispanic legal principles. Lands granted by Spain and Mexico carried comprehensive riparian rights, including the implied right to use streams for irrigation. During 1840-1889 English riparian doctrines were superimposed on the existing water law, resulting in the popular assumption that riparian land owners could use as much water as desired for any purpose. This doctrine, unsuitable for arid and semi-arid regions, prompted the Appropriation Acts of 1889 and 1895. Under these acts, newly acquired land carried no riparian rights; individuals had to obtain water rights through statutory procedures. Loose administration of these procedures led to a stricter permit system introduced in 1913. With the mixture of conflicting laws and the uncertain riparian element, efficient management of the state's water resources was impossible. Finally, the Water Rights Adjedication Act (1967) was passed to merge all surface water rights claims (riparian and appropriative) into the permit system and to finally adjudicate all surface water rights. Over 11,600 previously unrecorded claims (7 million acre-feet) were filed as of 1974. Some of the expected benefits of water rights adjudication are: (1) riparian rights are limited to a maximum quantity of water, (2) unclaimed surface water will be discovered and made available for appropriation, and (3) reduction of unused paper rights will reduce claims to the amount of water actually being used, preventing waste flow into the Gulf of Mexico. After several more years of expensive adjudication procedures, Texas surface water rights will be well established, making efficient administration and planning possible. (Cassar-FRC)

EPA'S APPROACH TO REGULATING NEW ENERGY TECHNOLOGIES,
Environmental Protection Agency, Cincinnati, OH.
D. G. Stephan.
AIChE Symposium Series, Vol 77, No 209, p 196-204, 1981. 4 Ref.

Descriptors: *Environmental policy, *Regulations, Environmental protection, Environmental effects, Administrative regulations, Standards, Water quality, Water management, Waste management, Fuel, Gasification, Coal gasification, *Energy technology.

The current approach of the EPA toward regulating new energy technologies is summarized, with the major emphasis being on water quality issues. EPA takes a great interest in the environmental implications of the manufacture of synthetic fuels, including coal liquefaction and gasification, retorting of oil shale, and the production of alcohol for fuel. Interest is also expressed in geothermal, solar, wind and tidal energy, combustion modification, coal and oil shale mining, energy conservation, fuel and energy transport and transmission, and new energy conversion systems such as ocean thermal gradients, magnetohydrodynamics, and fuel cells. In the area of pollution control guidance, the focal point of each regulation is intended to be a set of available control alternatives for each environmental discharge along with associated performance expectations and the basis for the alternatives presented. For most of the new energy technologies, exemplary full-scale and even pilot-scale waste treatment installations do not yet exist. A novel possibility now available is that of influencing in an environmentally productive way the choice by industry of the actual process technology to be commercialized and the overall designs of new plants, such that the most cost-effective environmental protection methods can be incorporated into the process design from the start. Specific energy technologies for which pollution control documents are now planned include low Btu coal gasification, indirect coal liquefaction, oil shale mining and processing, direct coal liquefaction, geothermal, medium Btu coal gasification, and high Btu coal gasification. Water-related environmental problems with synthetic fuels are also being studied, including the management of solid wastes from the production processes. (Baker-FRC)

DON'T DAMN THE STANISLAUS,
Lycoming County Planning Commission, Williamsport, PA.
T. Palmer.
National Parks, Vol 54, No 3, p 17-20, March, 1980. 4 Fig.

Descriptors: *Wild rivers, *Recreation, *Environmental effects, *Stanislaus River, *California, Legislation, White water, Rivers, Dams, *Reservoirs, Water resources development, Wildlife, Political aspects, Public opinion.

Construction of the New Melones Dam, completed in 1978 on the Stanislaus River, California, may drown the wildest remaining stretch of this popular white water stream. Already filled for 16 miles, the reservoir has not reached the white water stretch because a clear demonstration of public benefit and necessity has not been made and public pressure to stop filling at the present level has been great. Conservationists have disclosed many reasons for preserving this stretch of river. About 90,000 people annually use the area for rafting, hiking, fishing, and exploring the limestone caves. There are 600 identified archeological sites connected with the Miwok Indians and the Gold Rush era. A rare cave spider is among the 200 species of wildlife inhabiting the river environment. As of March 1980 a bill, HR 4223, to prevent further flooding of the valley was expected to reach the House floor. (Cassar-FRC)

THE RISK BUSINESS,
Thames Water Authority (England).
C. Sinnott.
Water, Vol 39, p 2-4, July, 1981. 4 Fig.

Descriptors: *Water policy, *Capital costs, *Budgeting, *Thames Water Authority, Planning, Institutional constraints, Expenditures, Utilities, Risks, Public utility districts, England.

When regional water authorities were formed in England in 1973-74, they inherited their predecessors' liberal capital spending aspirations. Government policy mandated a more restrained investment program, starting in 1979. In the Thames Water Authority these budget cuts caused increases in charges and decreased services. Four examples of water projects, now deferred to 1982, illustrate how this policy affects the consumers: insufficient water supplies in some areas, continued flooding of foul sewage during heavy rain, hazards of operating dilapidated sewage treatment plants which exceed pollution discharge standards, and disruption of navigation and irrigation from possible failure of a corroded and eroded weir. Sudden changes in investment levels, felt throughout the entire capital program, disturb long-term scheduling of construction, waste design effort, and may cause large fluctuations in work and expenditures. ENGINEERING U.S. WATER POLICY,
V. Fairweather.
Civil Engineering (New York), Vol 51, No 9, p 148, September, 1981.

Descriptors: *Water policy, *Administrative decisions, *Federal jurisdiction, Public policy, Administrative agencies, Administration, Administrative regulations, Regulations, Operating policies, Policy making, Decision making, United States.

The future of water policy in the United States is summarized. Programs which are proposed for action must have cost recovery built into them. Matters of national economic interest will play an increasingly strong role in obtaining project approval. Recommendations to the cabinet from the group working on water priorities will probably include rescission of the current 'Principles and Standards' which govern water project assessment. New guidelines will be proposed. These guidelines will emphasize national economic objectives. Cost sharing and user charges will definitely be part of the water projects that win approval in the future. Fifty-two water projects that have been languishing at the Water Resources Council will probably be returned to their originating agencies to be reprioritized. The water working group will also probably recommend elimination of the independent review that had been sought by the previous Administration. The Assistant Secretary of the Army forecasts greater power on the part of the states in selecting water projects. Even so, regional projects or those with national interest must not be overlooked. Port development projects should get underway in this decade. Flood control projects are not viewed as of highest priority. The Assistant Secretary also hopes to get the Army Corps of Engineers out of the business of regulating permits in wetlands. (Baker-FRC)

EPA MOVING TO CONTROL INDUSTRIAL TOXIC POLLUTANTS WITH NEW NPDES PERMITS,
Environmental Protection Agency, Boston, MA. Region I.
S. J. Silva.
Civil Engineering (New York), Vol 51, No 9, p 76-78, September, 1981. 2 Tab.

Descriptors: *Industrial wastes, *Permits, Hazardous materials, *Wastewater treatment, Legal aspects, Regulations, *Wastewater disposal, *Water pollution control.

NPDES permits are generally written for a specific period of time, 5 to 10 years, and contain effluent limitations and monitoring requirements for each discharge point. For the most part these permits limited the conventional pollutants: biochemical oxygen demand (BOD), total suspended solids (TSS), oil and grease, pH, as well as ammonia, metals, and phenols. In 1977 the Clean Water Act was passed to focus attention on controlling toxic pollutants. By July 1, 1984, industry is to meet minimum technology requirements, which means the best available technology economically achievable must be used for controlling toxic pollutants, and best conventional pollutant control technology used to control conventional pollutants. Permit issuance procedures have changed little since 1973. The law requires the EPA to consider more stringent limits for conventional pollutants in the second round permits, but such limits will only be imposed where additional required facilities meet a cost-reasonableness test. EPA will review the treatment facilities employed to meet present requirements and then determine what logical modifications or additions might further reduce conventional pollutant levels. Major emphases of new permits will be the control of toxic pollutants. Reductions in pollutants will most likely be achieved by: optimization of existing treatment systems most industries installed to meet current requirements; isolation at the source and separate treatment; process chemical substitution; or housekeeping improvements. Large scale application of advanced wastewater treatment techniques is not expected. (Baker-FRC)

CZ '80: COASTAL QUANDARIES PERSIST,
V. Fairweather.
Civil Engineering (New York), Vol 51, No 2, p 57-58, February, 1981.

Descriptors: *Coastal zone management, *Governmental interrelations, Environmental policy, Environmental protection, Barrier islands, Interagency cooperation, Planning, State jurisdiction, Economic aspects, Ocean dumping.

Coastal Zone '80, a specialty conference sponsored by the American Society of Civil Engineers (ASCE), was held in November, 1980, to provide a forum for the discussion of ideas about the conflicting interests and overlapping jurisdictions involved in coastal zone management in the United States. Major issues discussed at the conference included the future of environmental protection efforts with respect to coastal zones, expected changes in Federal government regulations with respect to coastal zone management and development under the Reagan administration, the conflicts between states' rights and national interest, ocean dumping, development of the outer continental shelf, port expansion efforts, and fishing interests. The debate over the stabilization of barrier reefs where shifting sands and erosion have taken their toll was particularly intense. Means of balancing state and Federal interests were discussed. DO WE NEED A NATIONAL WATER POLICY PROCESS. PRELIMINARY CRITERIA FOR DESIGNING A CONSTITUENCY-BASED WATER POLICY STRUCTURE,
National Academy of Public Administration. Washington, DC.
D. C. Harrison.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-172206. Price codes: A07 in paper copy, A01 in microfiche. Report to National Academy of Public Administration, Washington, DC 20036. December, 1981. 173 p, 1 Fig, 140 Ref. 3 Append. 14-34-0001-1414.

Descriptors: *Water policy, Public policy, Planning, River basin planning, Regional planning, Comprehensive planning, Long term planning, Future planning, Management planning, *Governmental interrelations, Interagency cooperation, Political aspects, Institutional constraints, Institutions, Organizations, Local governments, State jurisdiction, Federal jurisdiction-governmental interrelations, Public participation, Constituency development.

The nation appears to have neither an integrated water policy process nor an institutional support structure that can make it work. This paper addresses institutional barriers to national water policy. It concludes that we cannot govern integrated surface and groundwater systems that flow across political boundaries and affect a multitude of competing interests with a fragmented, inefficient policy guidance structure that encourages division rather than sharing of our water resources. This paper offers preliminary conceptual guidance on how to reexamine intergovernmental roles and relationships in the field of water policy. It describes a holistic conceptual model of the national water policy process and institutional support structure that will help to guide the design and evaluation of incremental improvements. Criteria for designing a 'constituency-based' water policy structure are taken from the interpretation and analysis of conflicts between management agencies and constituencies; between regions; and between other major institutional perspectives. The process that resolves these conflicts must provide lower levels of government with competence and with adequate representation in national water policy, and build the capacity to govern water resource systems. First priority must be given to the creation of a consitituency for an integrated water policy process. (Harrison-NAPA)

BARRIER ISLANDS: SHOULD ENGINEERS INTERFERE WITH NATURE,
V. Fairweather.
Civil Engineering (New York), Vol 51, No 5, p 64-67, May, 1981.

Descriptors: *Barrier islands, *Protection, Shores, Engineering, Regional development.

Questions concerning the construction of protection for barrier islands are presented. One major concern is with the cost of such protection and the question of who should pay for it. A second question deals with whether or not barrier islands can really be protected at all. Two environmentalist-backed bills in Congress call for an official no-development policy on undeveloped barrier islands and also for funds for government acquisition of undeveloped barrier islands. Currently, there appears to be a trend toward nonstructural approaches to coastal storm and erosion control. The most obvious nonstructural approach calls for no development whatsoever. Barrier island protection plans are discussed for Atlantic City, Cape May, San Francisco Bay area, North Carolina's Oregon Inlet, and others. Some engineers have suggested the use of dredging in certain situations, as opposed to other barrier island protective devices. It appears that barrier islands which have been developed will be protected, since they have economically viable communities. It is suggested that further development of barrier islands be stopped. (Baker-FRC)

6G. Ecologic Impact Of Water Development

FINAL ENVIRONMENTAL IMPACT STATEMENT; NORTH FORK PAYETTE RIVER PROJECT FERC NO. 2930-IDAHO.
Federal Energy Regulatory Commission, Washington, DC. Office of Electric Power Regulation.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-001984, Price codes: A12 in paper copy, A01 in microfiche. Report FERC/EIS-0027, October, 1981. 251 p, 18 Fig, 22 Tab, 58 Ref, 6 Append.

Descriptors: *Hydroelectric plants, *Environmental effects, *Recreation, *Dam effects, Alternative planning, Wild rivers, Boating, Scenery, Aesthetics, *Environmental impact statement, *North Fork Payette River Project, Idaho.

Idaho Power Company proposes to construct a 273-MW hydroelectric development that would be located on the North Fork Payette River, approximately 45 mi north of Boise, Idaho. The development would encompass a 15-mile reach of the river, and would include: two diversion dams, each

155 ft wide and 30 ft high, with a radial gate and flap gate; two pools, 600 to 700 in length; two 16-ft underground power tunnels; two surge tanks; two penstocks; two underground powerhouses; two tailrace tunnels, 3,600 and 760 ft long, returning water from the power houses to the North Fork Payette River, just upstream of the confluence with the South Fork; two switchyards; and a 230-kV transmission line. The energy generated by the proposed North Fork Payette River Project would make a significant contribution after 1986 to meeting projected energy requirements. An analysis of the feasibility of two hydroelectric and seven non-hydroelectric alternatives indicates that there are no reasonable hydroelectric alternatives, and that coal-fired steam-electric generation is the only reasonable non-hydroelectric alternative. Development of the proposed North Fork Payette Project would result in the following unmitigated environmental impacts: the loss of the recreational experiences, including boating opportunities, dependent on continuous whitewater for 15 miles of the river; a lessening of visual quality in the 15-mile reach of the river; the possible disqualification of the river as a potential candidate for inclusion in the National Wild and Scenic River System; and the removal of approximately 90 acres of timberland from production. VERTICAL MIGRATION AND MORTALITY OF BENTHOS IN DREDGED MATERIAL. PART I: MOLLUSCA,
Delaware Univ., Lewes. Coll. of Marine Studies.
D. Maurer, R. T. Keck, J. C. Tinsman, and W. A. Leathem.
Marine Environmental Research, Vol 4, No 4, p 299-319, 1981. 6 Tab, 36 Ref.

Descriptors: *Mollusks, *Migration, *Mortality, Dredging, *Spoil banks, Benthic fauna, Benthos, Invertebrates, Aquatic animals, Sediments, Estuaries, Temperature effects.

Benthic invertebrates have many characteristics which make them prime candidates for burial studies in dredged material. A major concern in dredging and disposal projects is the effect of burial on the survival of benthic invertebrates. The purpose of this study was to determine the ability of estuarine benthos, and in particular three species of mollusks (Mercenaria mercenaria, Nucula proxima, and Illyanassa obsoleta), to migrate vertically in natural and exotic sediments and to determine the survival of benthos when exposed to particular amounts of simulated dredged material. Mortalities generally increased with increased sediment depth, with increased burial time, and with overlying sediments whose particle size distribution differed from that of the species' native sediment. Temperature affected mortalities and vertical migration, with both being greater in summer temperatures than in winter temperatures. It was concluded that vertical migration is a viable process which can significantly affect rehabilitation of a dredged disposal area. Under certain conditions, vertical migration should be considered, together with larval settling and immigration from outside impacted areas, as a mechanism of recruiting a dredge-dump site. RAINFALL PREDICTION-MEASUREMENT SYSTEMS AND RAINFALL DESIGN INFORMATION FOR URBAN AREAS,
Illinois State Water Survey Div., Champaign.
S. A. Changnon Jr., F. A. Huff, J. L. Vogel, D. A. Brunkow, and D. W. Staggs.
Circular 146, 1980. 63 p. 9 Fig, 14 Tab, 87 Ref, Append.

Descriptors: *Weather forecasting, Rain gages, Monitoring, *Rainfall, *Prediction, Precipitation, Computers, *Radar, Flood forecasting, Net rainfall, Weather data collections, Rainstorms, Site selection, *Remote sensing, Climatology,*Urban areas.

This report examines various systems for rainfall forecasting in urban areas and developes guidelines for their use by water management authorities. Most of the data were gathered from the Chicago Hydrometeorological Area Project (CHAP), which began in 1976 and concluded in 1979 with a 2 1/2-month demonstration program. Key elements in rain prediction systems are a radar system, recording raingages, a computer system, and a communication system to connect the components. A radar system provides a more accurate portrayal of storm rainfall than dense raingage networks and also yields data on approaching short-term (30-180 minute) forecasts. However, radar signals can make large errors, particularly with 5-cm equipment, so data in real-time from telemetered recording raingages are needed to adjust the radar-indicated rainfall. The types of gages and their optimal siting and installation are reviewed. A computer system translates digital radar data into rainfall estimates by integrating the raingage-indicated rainfall with the radar signal. It also calculates motion and rain change fields needed to predict urban rainfall. These data can be converted to a cartesian grid for analysis. Several types of communication links may be required, such as radar-raingage communication and radar system to user. A final section of the report covers the possible range of data analysis and interpretation needs that are available and applicable today as well as some future capabilities. A further discussion outlines the time constraints of objective forecasting techniques using radar observational data, and the role people and objective techniques play in rain forecasting for time frames over 3 hours. REMOTE SYNOPTIC SURFACE FLOW MEASUREMENTS IN SMALL BODIES OF WATER,
Scripps Institution of Oceanography, La Jolla, CA.
D. Sheres.
PhD Dissertation, 1980. 110 p, 25 Fig, 5 Tab, 25 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-00037.

Descriptors: *Flow measurement, *Remote sensing, *Surface water, Aerial photography, Flow profiles, Wavelengths, Wave-Current interactions, Surface circulation.

A new approach to remote and synoptic surface flow measurements in small bodies of water is described and the investigation to determine the practicality of this technique is included. The approach is based on imaging monochromatic wavetrains, of known frequency, propagating over surface flows. It is shown that the wavelength and direction of two monochromatic wave trains of known frequency, at a region of interest, carry all the necessary information to determine the surface flow in that region. Experimental tests, conducted both in a wavetank and in a lagoon, utilizing inexpensive and readily available equipment, are described as well. These tests have shown the viability of this remote and synoptic surface flow measurement. Practical aspects of the measurements, such as vertically nonhomogeneous flow profiles, data processing of the aerial photos via 2D Fourier transforms, and the measurement of wavelength by photography of specular reflection of sun light from waves, are discussed. The extension of this measurement to coastal regions in the open ocean is briefly explored together with a preliminary experiment that tests the possibility of obtaining quantitative flow data from boat wave measurements. Such utilization of boat waves may enable surface flow measurements in areas otherwise inaccessible. (Sinha-OEIS)
W82-03012

AN AERIAL TECHNIQUE FOR ASSESSING THE IMPACT OF COOLING WATER DISCHARGES ON RECEIVING WATER,
State Univ. of New York Coll. of Environmental Science and Forestry, Syracuse.
J. R. Schott.
PhD Thesis, January, 1980. 142 p, 35 Fig, 10 Tab, 25 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-19081.

Descriptors: *Remote sensing, Aerial photography, *Water temperature, Thermal pollution, *Temperature effects, Thermal plumes, *Cooling water, *Ecosystems, Environmental effects, Powerplants, Water quality.

This research demonstrated that aerial remote sensing could be a useful tool in studying the effect of power plant cooling water discharges on certain aspects of aquatic systems. Thermal infrared imagery, aerial color photography and laboratory models were combined to study the effects of cooling water discharges on aquatic ecosystems. A new technique for wholly airborne calibration of aerial infrared data was utilized permitting remote measurement of water surface temperatures to within 0.4 C plus or minus 0.3 C of actual values. In addition, color photography was used to monitor chlorophyll, lignin and yellowing organic concentrations in the vicinity of the power plant. This was accomplished using models developed in the laboratory relating the optical properties of water to the concentration values of various parameters in the water. The theory, testing and evaluation of the approach at a particular site are discussed. (Sinha-OEIS)

USE OF ENVIRONMENTAL SATELLITE DATA FOR INPUT TO ENERGY BALANCE SNOWMELT MODELS,
California Univ., Santa Barbara. Computer Systems Lab.
J. Dozier.
National Oceanic and Atmospheric Administration, National Earth Satellite Service, Washington, DC, December, 1980. 118 p, 24 Fig, 2 Tab, 73 Ref. 04-8-MO.

Descriptors: *Snowmelt, *Remote sensing, *Satellite technology, *Energy, Model studies, Canopy, Forests, Runoff rates, Temperature, Meteorological data collection, Snowmelt runoff.

Mapping snow surface temperature over a large alpine area is a useful tool for snowmelt runoff investigations. Tiros-N satellite data used to measure snow surface temperature over a large area have been calibrated with micrometeorological data from two remote stations in the southern Sierra Nevada, and from active field measurement of snow surface temperature using a radiant thermometer. Performance of the system under isolated alpine conditions has been satisfactory. Models for clear sky solar and longwave radiation have been developed and tested. The clear sky solar radiation model has been extended to calculate the necessary corrections for radiometric data over rugged terrain. A procedure for deriving an estimate of the spectral albedo of an extensive alpine snow cover from satellite spectral radiance measurements was demonstrated with Landsat digital imagery of the southern Sierra Nevada. The resultant spectral albedo measurements are adequate for input to an areally extensive energy-balance snowmelt model. Extensive point measurements of forest canopy densities were made during both winter and summer conditions. These will be extended over the area by correlation to satellite

brightness data. This information will then be used to model the effect of canopy cover on the snow surface radiation budget. (Moore-SRC)

METHODS OF DISCHARGE COMPENSATION AS AN AID TO THE EVALUATION OF WATER QUALITY TRENDS,

Geological Survey, Raleigh, NC.
D. A. Harned, C. C. Daniel, III, and J. K. Crawford.
Water Resources Research, Vol 17, No 5, p 1389-1400, October, 1981. 17 Fig, 1 Tab, 23 Ref.

Descriptors: *Water quality, *Discharge measurement, Flow rates, Water quality management, *Solute transport, Data acquisition, Lakes, Streams, Water analysis, *Streamflow-water quality relations.

This paper presents two new approaches to evaluating trends in stream water quality and tests the performance of the new methods against existing methods. One method, discharge normalization, adjusts daily discharges using a central value calculated for the period of record and recalculates daily specific conductance from the adjusted discharges and discharge versus specific conductance regressions. Normalized concentrations for many constituents can then be calculated from linear relationships between specific conductance and constituent concentrations. The second method, discharge-frequency weighting, weights each observed concentration by a fraction of the total area underneath the discharge-frequency distribution of the period of record. The weighted concentrations are summed for each year. Both normalized values and weighted values can be plotted against time to produce trends essentially independent from discharge effects. Results from the methods are statistically similar to each other and to results from other trend detection techniques. However, each method also has limitations. Both are limited to use of water quality data collected in conjunction with a continuous record of streamflow. Normalization also requires daily specific conductance records. (Baker-FRC)

LARGE RAIN DROPS IN THE BRIGHT BAND,

Rome Air Development Center, Hanscom AFB, MA. Electromagnetic Sciences Div.
E. E. Altshuler.
Nature, Vol 288, No 5790, p 464-465, December 4, 1980. 2 Fig, 6 Ref.

Descriptors: *Measuring instruments, *Fluid drops, Rain, Ice, Precipitation, Radar, Remote sensing, Rainfall rate, Rain drops, *Rain-drop size analysis, Distribution patterns.

A technique is described for inferring rain-drop sizes which produces results in support of the bright band model. Slant-path attenuation measurements at frequencies of 15 and 35 GHz were made in the Boston area during 8 storms of various intensities. A dual-frequency radiometer was the detector. Antenna beamwidths were about 9 and 4 arc min, respectively, and the center of the Sun was tracked with an accuracy of at least 0.5 arc min. Over 10,000 simultaneous measurements of attenauations at 15 and 35 GHz were made, and the ratios of these attenuations were plotted against the 15-GHz attenuations. If the rain drop size distributions along the slant path were similar to those measured on the ground, the attenuation ratios would have been of the order of 6 or 7 for low rain rates and decrease to about 4 or 5 for the higher rain rates, corresponding to higher 15-GHz attenuations. However, the bulk of the points plotted had ratios between 2 and 4 and occur for low 15-GHz attenuations. These results are thus not consistent with ground level rain drop size distributions. Instead they suggest that somewhere along the slant path there is a significant contribution to the attenuation which results from precipitation with characteristics of rain drops having very large effective drop diameters. Since most of the rain along the path occurs below the bright band, the attenuation contribution from the bright band would be expected to be relatively small. However, drop diameters of the order of 10-200 mm are certainly possible. It may be helpful to conduct both dual frequency attenuation and dual polarized reflectivity measurements to differentiate between rain and ice. The attenuation measurement easily distinguishes rain and ice, but this is not always the case with radar. (Baker-FRC)

F. Valentin.
Water Science and Technology, Vol 13, No 8, p 95-102, 1981. 3 Fig, 2 Ref.

Descriptors: *Sewer hydraulics, *Flow discharge, *Flow measurement, *Pressure measuring instruments, *Flowmeters, Sewers, *Sewer systems, Flow profiles, Flow rates, Discharge measurement, Conduits, Measuring instruments, Venturi meters, Gages.

Conventional sewerage discharge measurement devices often are inadequate for control measurements in the sewerage system itself and may reduce channel width lowering upstream capacity. To improve upon this situation, hydraulic events occurring during the changeover from free flow to pressurized flow conditions and the possibility of continuous flow measurements under such circumstances were studied in simulated unsteady flow conditions. Maximum propagation velocities of over 200 m/sec during self priming were used while paying special attention to the self priming of the pipe in relation to sewage flow. Various commercially available instruments were tested with free surface flow and pressurized flow in the experimental pipe. During transient flow conditions, the Venturi flume was found to be inadequate. However, an electromagnetic flowmeter gave sufficiently accurate discharge measurements while allowing better knowledge of the transient flow itself. Improvement in the field of discharge measuring devices for the management of sewerage systems is still needed. (Geiger-FRC)

REMOTE SENSING FROM SPACE-II.

Civil Engineering (New York), Vol 50, No 4, p 63-65, April 1980. 2 Fig.

Descriptors: *Remote sensing, *Irrigation efficiency, *Aquifer management, Agriculture, Landsat, Ogallala Aquifer, *Satellite technology.

Landsat data are being used to improve estimations of irrigated crop acreage. The data can be used to regulate drawdown of the Ogallala Aquifer, which extends over north Texas and states north. To date the irrigated areas in two countries have been mapped by Landsat, and the procedure was found only 3-4% less accurate than higher-resolution 'classified' military imagery. In process is a study of using Landsat data for more efficient irrigation by detecting crop stress or soil dryness. (Cassar-FRC)

EVALUATION OF INFILTRATION MEASUREMENTS FOR BORDER IRRIGATION,

Science and Education Administration, Phoenix, AZ. Conservation Lab.
A. J. Clemmens.
Agricultural Water Management, Vol 3, No 4, p 251-267, 1981. 4 Fig, 8 Tab, 12 Ref.

Descriptors: *Infiltration, *Irrigation, *Border irrigation, Data collections, Soil moisture, Surface irrigation, Bouwer's method, Model studies, Ring infiltrometers, Agriculture.

Several methods for measuring infiltration in irrigation borders were evaluated--the ring infiltration method, Bouwer's method, and the zero-inertia border irrigation model. Ring infiltrometers, in use for many years, give good results if the ring is properly installed and operated, if measurements are made during an irrigation, and if a volume balance is maintained in the border. Data from ring infiltrometers are fitted to power functions for infiltration rate and cumulative infiltration rate vs. time and to a branch function where the infiltration rate is not allowed to drop below a minimum (final infiltration rate). Cumulative infiltration data are not reliable in sandy soils, but in general are less subject to error and fluctuation. Bouwer's method, using a series of borders as infiltrometers, is good in borders with uniform infiltration and within a large number of borders, but not when infiltration varies spatially. The zero-inertia border irrigation model, useful when good infiltration information is available, was used to study two cases of surface irrigation. (Cassar-FRC)

REMOTE SENSING APPLICATIONS FOR RESOURCE MANAGEMENT,

California Univ., Davis. Dept. of Land, Air and Water Resources.
C. J. Johannsen, and T. W. Barney.
Journal of Soil and Water Conservation, Vol 26, No 3, p 128-131, May-June, 1981. 8 Ref.

Descriptors: *Water management, *Remote sensing, *Data collection, Resources management, *Satellite technology, Aerial photography, Infrared imagery, Telemetry, Land management, Data interpretation, Erosion control, Watershed management, Data storage and retrieval, Data processing.

Remote sensing is the science and art of acquiring information about material objects from measurements made at a distance without coming into physical contact with the objects. Some applications of remote sensing devices to land and water management are described. Data bases can be used to analyze remotely sensed information. Geographic information systems are useful in gathering, storing, analyzing and disseminating data on natural resources and socioeconomic data. The use of remote sensing devices in the study of agriculture, rangelands, forestry, hydrology, geology, cartography, land use, thermography, environmental protection, oceanography, disaster warning, and human and animal health is examined. Remotely sensed data from satellites can provide a continuous flow of information about land cover and land use conditions to aid in soil erosion control in watersheds. Transfer of technology in remote sensing must increase to be of more value to resource managers. (Geiger-FRC)

7C. Evaluation, Processing and Publication

CANADA WATER YEAR BOOK 1979-1980, WATER RESEARCH DIVISION.

Department of the Environment, Ottawa (Ontario).
Available from Canadian Government Publishing Centre, Hull Quebec, 132 p, 1981. Photos, Charts.
ISBN 0-660-10878-X.

Descriptors: *Canada, *Water resources development, *Research, *Aquatic environment, Physical analysis, Wastewater treatment, Water quality, *Water management, Chemical properties, Biological properties, Wastewater disposal.

This is the fourth in the series of the Canada Water Year Book and reviews the principal activities in water research across Canada. Other years covered: water resources, water management, and water data. Water Research is explored through the nature and goals, research and development, and hydrological research. Major topics include: physical properties; chemical and biological processes in the aquatic environment; water quality; wastewater treatment and ultimate disposal; and water quality and water resources planning. (WATDOC)
W82-03096

THE CANADA WATER ACT, ANNUAL REPORT 1980-1981.
Department of the Environment, Ottawa (Ontario).
Available from Ministry of Supply and Services, Hull, Quebec, 1981, 44 p. ISBN 0-662-51561-7.

Descriptors: *Water resources management, *Water quality, *Nutrients, Public information program, Management, Regulations, Research, *Canada Water Act, Projects.

The report highlights the provisions of the Canada Water Act and briefly discusses the individual programs which have been or will be undertaken to meet these provisions. (WATDOC)

CANADA WATER YEAR BOOK 1977-1978.
Available from Canadian Government Publishing Center, Hull, Quebec, 120 p, 1978, Photos, Tab, Maps. ISBN 0-660-10142-4.

Descriptors: *Canada, *Hydrologic data, *Water resources development, *Data collections, Snow, Ice, Rivers, Streams, Lakes, Reservoirs, Groundwater, Navigable waters, Charting, Pollutants, Water uses, Information systems, WATDOC, Programs, *Water management.

This edition of the Canada Water Year Book provides a brief report on the numerous water data monitoring programs. It provides some background on most programs, explains when and why the programs were initiated, how they are conducted, what types of data are available and where the data can be obtained. The edition is presented under the following main topics: (1) Water Data Fills an Important Roll in Society; (2) Canada's Water Resources Range Between Wide Extremes; (3) Basic Programs for Collecting Water Data, ie. Water in the Atmosphere, Snow and Ice, Rivers and Streams, Lakes and Reservoirs, Ground Water, Charting Navigable Waters, Inventory of Water Pollutants and Information Systems, WATDOC; (5) Water Data of General Interest, ie. The Flood Damage Reduction Program, Water Power Development, Large Water Diversions in Canada and International Programs. Shore Damage Survey of the Great Lakes and Hydrological Atlas of Canada; and, (6) Water Resources Data Research. (WATDOC)

HYDRAULIC MODEL STUDIES OF THEODORE ROOSEVELT DAM - SOUTH SPILLWAY,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
M. F. Young.
Report GR-81-10, May, 1981. 41 p, 24 Fig, 1 Append.

Descriptors: *Hydraulic models, *Spillways, *Overflow, *Flood damage, Erosion, Flood discharge, Flood protection, Dams, Spillway capacity, Model studies, Radial gates, *Theodore Roosevelt Dam, Salt River, Arizona.

Roosevelt Dam originally had two uncontrolled overflow spillways. During the 1930's, radial gates were installed on both spillways to provide extra reservoir storage. The spillways were cut into each abutment with each spillway crest oriented to continue the arch shape of the dam. This alinement creates many problems because the south spillway channels its flow directly toward the upper right training wall instead of downstream. During a flood in February 1980, the spillways operated with a combined discharge of approximately 73,500 cu ft/s. The south spillway overtopped the right training wall, cascaded down the slope, and entered the powerhouse. A downstream training wall that protected the highly jointed canyon walls from erosion was damaged, and a converted warehouse was also damaged by mud and water entering the lower floors. A 1:36 scale model was used to develop protective measures for this powerplant, the highly jointed downstream canyon wall, and other structures. Also determined from the model study were spillway and radial gate discharge capacity curves. The model showed that a 15-ft high extension to the right training wall would provide full protection for the powerhouse. A 200-ft long wall was found necessary to provide adequate protection for the lower canyon wall. An extension to this wall, angled toward the river channel, was also recommended to protect the warehouse. (Moore-SRC)

AIRY HOLM DAM - KIELDER WATER SCHEME,
Babtie, Shaw and Morton, Glasgow (Scotland).
H. G. Perfect.
Water Services, Vol 85, No 1026, p 389-392, August, 1981. 7 Fig, 2 Tab, 1 Ref.

Descriptors: *Dams, *Water supply, Water demand, *Scotland, Planning, Decision making, Water resources development, Water supply development, *Airy Holm Dam.

The Kielder Water Scheme has been devised to enable the Northumbrian Water Authority to meet expected increases in water demands in that section of Scotland well into the next century. The scheme will increase river abstractions on the Rivers Tyne, Wear and Tees by up to 900 tcmd. Water flow in the River North Tyne will be regulated by releases from Kielder Water. Nearly 60 km downstream on the River Tyne, water will be abstracted at Riding Mill Pumping Station. Total pumping capacity at Riding Mill Station will be 1092 tcmd, including standby. Transfer of water to the Rivers Wear and Tees will be through a 6 km long steel pipeline, 2 m in diameter, to a surge tank at Letch House. From here, water will flow by gravity through a 32 km long aqueduct, 2.9 m in diameter, constructed mainly in tunnel and capable of carrying up to 1180 tcmd. Airy Holm Dam will form a 250,000 cubic centimeter capacity reservoir to provide balancing storage for the operation of the transfer works. Construction is nearing completion, and it is anticipated that full commissioning will take place during 1981. Information is provided on the actual construction of the dam, including concrete mixes, grouting, embankment flanks, and instrumentation. (Baker-FRC)

A NEW SEDIMENT TRAP EFFICIENCY CURVE FOR SMALL RESERVOIRS,
Science and Education Administration, Beltsville, MD.
H. G. Heinemann.
Water Resources Bulletin, Vol 17, No 5, p 825-830, October, 1981. 6 Fig, 1 Tab, 11 Ref.

Descriptors: Reservoir deposition, *Trap efficiency, *Sedimentation, Design criteria, Reservoir design, Reservoir storage, Small watersheds, *Agricultural watersheds, Ponds, Reservoir capacity, *Reservoir silting, Agricultural reservoirs.

A new sediment trap efficiency curve was developed by analyzing data on 20 small agricultural reservoirs of 3,000 to 4 million cu m capacity. Only reservoirs with drainage areas of 15 sq miles or less were considered. Reservoirs of this type are built for flood control, small water supply, recreation, sediment control, or a combination of these. The new curve, which plots % sediment trap efficiency vs. capacity:inflow ratio, is slightly different from the Brune (1953) curve in common use. The volume allotted in reservoir storage for trapped sediment could be reduced by 4-10% according to the new curve, saving construction costs. (Cassar-FRC)

PROVISION OF ENERGY REQUIREMENTS FOR REMOTE COMMUNITIES BY SMALL-SCALE HYDRO DEVELOPMENT,
R. A. Everdell, and F. M. Near.
Canadian Water Resources Journal, Vol 6, No 3, p 143-162, 1981. 7 Fig.

Descriptors: *Hydroelectric plants, *Environmental effects, Water resources development, Dams, Powerplants, *Ontario, Small-scale hydroelectric plants, *Remote communities.

Small prefabricated hydroelectric generating stations have been installed at two sites in Ontario. The Mini Hydel stations are designed to operate at heads from 3 to 8 meters. Water is delivered to turbines via open flumes at lower heads and pressure casings at higher heads. Plant outputs are 100-400 kw. Francis turbines are used with a speed increaser gearbox and a standard generator. Generally, small hydro projects are compatible with the environment. Air quality and noise effects are negligible. Water quality is affected considerably during construction but minimally in the long term. The projects produce little impact on fish, wildlife, society, or esthetics. The Wasdell Falls Project and the Sultan plant are described in detail. Future developers of small hydro plants are advised to select sites needing minimal civil work, bypass excess flows, conduct thorough preconstruction surveys, seek permits a year before planned construction, schedule construction for a single summer season, choose easy-to-build designs, minimize custom modifications, and accurately estimate required resources and work schedules. (Cassar-FRC)

WARMING UP TO GEOTHERMAL,
P. A. Robbibaro, and A. O. Watson.
Drilling, Vol 41, No 13, p 180. 183, 186, 188, October, 1981.

Descriptors: *Geothermal resources, *Drilling equipment, *Well drilling, Hot brines, Heat, Corrosion, Wells, Steam, Geohydrology, Deep wells, Water circulation, Water resources development, Energy sources, Exploration, *Energy conversion, Hydraulic systems, *Design criteria, Materials, Engineering.

Exploration in geothermal resources imposes great demands on conventional drilling equipment. Four problems are high temperatures, abrasive formations, lost circulation, and highly corrosive fluids. Hydrothermal systems, the most abundant geothermal resources, produce high temperatures, 350-700 F, and high mineral concentrations, up to 300,000 ppm. These extreme conditions are responsible for collapsed or parted casings, cementing, metal fatigue, severe corrosion, and scale buildup. Mud heat exchange towers can lower temperatures in drilling fluids. An example of a vapor-dominated

system is the Geysers, north of San Francisco. Problems in this steam-producing field are disintegration of serpentine and well collapse, loss of circulation, low reservoir pressure, erosion, and corrosion. Methods for combating these difficulties include sealing compounds for fractures, air drilling (dust, mist, aerated mud, and stiff foam), and use of corrosion resistant materials. A major problem in hot dry rock exploration is the 300-400 F temperature range. This type of drilling is in the development stage. Conventional drilling, improved with more durable bits and more efficient techniques, and unconventional methods (pressurized water jet drilling and percussion drilling) are useful in development of wells in hot rock. Geopressured resources, also in initial development stages, range from 250 to 450 F. Scaling and corrosion of metal equipment and deterioration of rubber materials result from the heat and high mineral concentrations. (Cassar-FRC)

EVALUATION OF THE EFFECTIVENESS AND RELIABILITY OF DRAINS OF THE TAILRACE OF THE PLYAVINYAS HYDROELECTRIC STATION,

M. F. Rogal.
Hydrotechnical Construction, No 1, p 50-58, January, 1980. 6 Fig, 1 Tab, 5 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 1, p 28-34, January, 1980.

Descriptors: *Drainage engineering, *Well function, *Seepage, Hydroelectric plants, Drainage wells, Drainage systems, Drains, Wells, Well seepage, Soil engineering, Soil mechanics, Corrosion, Soil stability, Tailrace, Dams, Reservoir design, Plyavinyas Hydroelectric Station, USSR.

The drainage system of the Plyavinyas hydroelectric station was evaluated. The geology of the site is complex, consisting of stratified inhomogeneous soils with interconnecting artesian horizons. This paper concerns the drains in the right wall of the tailrace. It was necessary to drain this area because 30-40 m of soil, a natural surcharge, had been removed. A series of drain wells was constructed to prevent expansion of the sand foundation soils upon reservoir filling. Monitoring and inspection indicated that the seepage regime changed considerably after filling the reservoir. Some former discharge areas became recharge areas. Two cones of depression formed in connection with the drain wells. The capacities of most of the drain wells were 5-10 times lower than maximum design specifications. Sand filling and severe pipe corrosion in wells draining one wall created a flooding threat. Pumping of relief wells did not substantially lower the head in the malfunctioning wells because of seepage inhomogeneity. Evaluation of several variant drain schemes showed that 7 of the 17 wells in the problem area could be closed without danger of upward movement of the soil. (Cassar-FRC)

GROUTING WORKS IN THE DIVERSION TUNNEL OF THE INGURI HYDROELECTRIC STATION,

N. V. Dmitriev, E. S. Baranos, and V. A. Ashikhmen.
Hydrotechnical Construction, No 9, p 879-884, September, 1980. 3 Fig. Translated from Gidrotekhnicheskoe Stroitel'stvo, p 3-6, September, 1980.

Descriptors: *Tunnel construction, *Grouting, *Concrete technology, Productivity, Water transport, Hydroelectric plants, *Inguri hydroelectric plant, Hydraulic structures, Diversion structures, USSR.

Consolidation grouting in the 15 km diversion tunnel of the Inguri hydroelectric station amounted to 617,000 cu m using 113,000 holes. Fill-in grouting of 158,000 sq m was done in the tunnel crown. It was necessary to increase the monthly grouting output from 2000-3000 m to 20,000-25,000 m during the later phase of the project. Drilling-grouting frames and semiautomatic central grout plants in combination with concrete placing units coordinated the general construction with grouting so that the tunnel was completed on schedule. The record grouting output was 55,500 m in the month of September 1978. (Cassar-FRC)

INFLUENCE OF GEOLOGY ON TUNNELLING CONDITIONS AND DEFORMATIONAL BEHAVIOR OF SUPPORTS IN FAULTED ZONES A CASE HISTORY OF THE CHHOBRO-KHODRI TUNNEL IN INDIA,

Central Mining Research Station, Dhanbad (India).
J. L. Jethwas, B. Singh, B. Singh, and R. S. Mithal.
Engineering Geology, Vol 16, No 3/4, p 291-319, November, 1980. 16 Fig, 6 Tab, 29 Ref.

Descriptors: *Tunnel construction, *Tunnel linings, *Tunnel failure, Tunneling, Geologic fractures, Rocks, *India, Hydroelectric plants, Dam construction, Chhibro-Khodri Tunnel.

Problems associated with highly squeezing rock masses found in recurring faulted zones have delayed the construction of the Chhibro-Khodri Tunnel, part of the Yamuna Hydroelectric Scheme near Dehradun in the lower Himalayan region of India. Attempts were made to measure the tectonic slip along a fault zone running across the tunnel, and the suitability of a flexible lining for this region was evaluated. Inadequate surface and subsurface geological investigations contributed to inappropriate site selection for the tunnel. The elasto-plastic theory was used to provide an assessment of rock pressure, and a flexible support system consisting of steel arches with loose backfill caused significant load shedding. The heading supports underwent severe buckling and bending under the influence of side pressure in squeezing rock conditions when invert struts were not provided. This contributed to delays in the project. The monthly rate of tunnel radial closure at the time of stabilization ranged from 0.05 to 0.10% of the radium of the opening. (Small-FRC)

RECENT WATER TOWERS IN NORFOLK,

Anglian Water Authority, Norwich (England). Norwich Sewage Div.
K. Rowe.
Water Services, Vol 85, No 1023, p 236, 241, 242, May, 1981. 1 Tab.

Descriptors: *Hydraulic structures, *Water tanks, *Storage tanks, Design criteria, Economic aspects, Concrete construction, Norfolk, *United Kingdom.

A review is presented of the design of modern water towers in Norfolk, United Kingdom. There is a lack of standardization in the water industry in the design process and efforts are sometimes lacking to be economical in construction methods or to reduce required maintenance costs. Five towers are described which vary in size from 220 cu m to 2200 cu m. Three were constructed of reinforced concrete, one of reinforced stressed concrete, and one of steel. Total costs ranged from 38,000 British Pounds Sterling to 367,093 British Pounds Sterling. In a tower, the depth of water should be less than 20 m, and it is better to use a rubber water bar at critical joints. Watertightness is of fundamental importance, and no corners should be cut in this regard. Future designs should consider other potential development on the site such as office space. Radio towers can be located on roofs, which will provide additional income. If public access is necessary at the site, the security of the water must be considered. (Small-FRC)

TVA'S PUMPED-STORAGE PLANT.

Civil Engineering (New York), Vol 50, No 6, p 84-87, June, 1980. 1 Fig.

Descriptors: *Pumped storage, *Rockfill dams, *Hydroelectric plants, Dams, Hydroelectric power, Powerplants, *Tennessee Valley Authority, Raccoon Mountain, Tennessee.

The Raccoon Mountain pumped storage plant near Chattanooga, Tennessee, is capable of generating 1530 MW of electricity for 20 hours before the upper reservoir needs to be refilled. The 230 ft high compacted rockfill dam, using 10 million cu yards of material, is TVA's largest rockfill dam. The silo-like intake structure is designed to eliminate vortex action during generation. The pump/turbines are the most powerful in operation--525,000 hp as turbines and 3850 cfs at 1000 ft as pumps. The generator motors are the highest capacity reversibles in the world--425,000 kVA as generators and 547,000 hp as motors. The 35,000 acre-ft storage capacity of the upper reservoir gives the plant flexibilty in operation. (Cassar-FRC)
W82-03250

RESEARCH NEEDS: HYDRAULICS, COASTAL ENGINEERING AND IRRIGATION,

Civil Engineering (New York), Vol 50, No 4, p 83-87, April, 1980. 1 Fig.

Descriptors: *Civil engineering, *Research priorities, Erosion control, Dam failure, Risks, Benthic fauna, Water pollution effects, High flow, *Irrigation, Shore protection, Water use, Wastewater treatment, *Coastal engineering.

The hydraulics-coastal irrigation-engineering subgroup of the American Society of Civil Engineers-National Science Foundation held a workshop on research needs in civil engineering. At the workshop a number of research priorities were determined: processes involved in scour and deposition in rivers, predicting dam failures, design criteria for high velocity flows, risk analysis for dams, impact of sediments in waste plumes on benthic fauna, physical modeling of shore protection structures, conflicts between irigation and western energy projects, necessary treatment level of municipal wastewater for ocean disposal, irrigation methods in humid areas, and irrigation energy efficiency. (Cassar-FRC)

DON'T ALWAYS PUT DAM IN NARROWEST PART OF VALLEY,

Laboratorio Nacional de Engenharia Civil Lisbon (Portugal). Dept. of Hydraulics.
F. Abecasis.
Civil Engineering (New York), Vol 50, No 6, p 93-94, June, 1980. 2 Fig.

Descriptors: *Dams, *Erosion, *Hydroelectric plants, Structural engineering, Spillways, Design criteria, Sediment deposition, Energy dissipation.

The hydraulic problems encountered in high arch dams built in narrow valleys may offset the cost savings in construction. Potential difficulties are: river bed erosion in the jet-impingement zone, eroded material in the tailrace tunnels, and bar formation downstream of tunnels. A hydropower project on the Douro River between Spain and Portugal is an example. The 330 ft Picote Dam, put into operation in 1958, is a double curvature arch with a 456 ft long crest. The water discharges along the spillway surface and passes over a ski jump energy dissipator. A pit 65 ft deep and a bar 50 ft high have formed downstream, causing the upstream water level to rise and reduce the head at the turbines. Repair and maintenance work required a $1 million tunnel to divert flow from the work area. Bar removal and river bed repair is difficult and has interfered with power production. The five-year old Cabora-Bassa project, 490 ft high, 755 ft crest dam, has shown no serious problems as yet, but modeling studies indicate potential erosion and bar formation. These problems might have been avoided by building the dam in a wider reach of the valley or using gravity or buttress construction. (Cassar-FRC)

VALUE ENGINEERING SAVES DAM PROJECT,

Field 8—ENGINEERING WORKS

Group 8A—Structures

Converse Ward Davis Dixon, Inc., San Francisco, CA.
E. A. Miller, and G. S. Salzman.
Civil Engineering (New York), Vol 50, No 8, p 51-55, August, 1980. 1 Fig, 1 Tab.

Descriptors: *Construction costs, *Dams, *Seepage control, Engineering, Rockfill dams, Spillways, Bentonite, *Elgo Dam, Dam sites, Slurries, Water resources development, *Arizona.

The Elgo Dam, east of Phoenix, Arizona, was built after value engineering reduced the projected costs by 25% or $1 million. Revised plans required relocation of the dam site 750 ft upstream to take advantage of a natural rock ridge for the spillway site and using local materials for the 71 ft high, 1000 ft long earth and rockfill dam. The new design also provided for a central impervious core with a wider cross sectional area and flatter upstream and downstream slopes. Although the volume of embankment materials was double that of the original design, transportation costs were greatly reduced. Water seepage under the embankment was controlled by a cement-bentonite cutoff wall (Cassar-FRC)

THE EL CAJON HYDRO PROJECT IN HONDURAS, PART TWO,
Empresa Nacional de Energia Electrica, Tegucigalpa (Honduras).
A. Diaz Arriviallaga, and H. Kreuzer.
International Water Power and Dam Construction, Vol 33, No 3, p 37-39, March, 1981. 7 Fig, 5 Tab.

Descriptors: *Dam design, *Spillways, *Diversion, *Financing, El Cajon Project, *Honduras, Rivers, Hydroelectric plants, Powerplants, Construction.

This paper, a continuation of a description of the El Cajon hydroelectric project, Honduras, concentrates on spillway facilities, river diversion, and financing. The spillway has a design inflow of 14,300 cu meters per sec into the reservoir. Spillway facilities include three components: a tunnel spillway, a crest spillway, and bottom outlets. During the 2.5 years of construction, the Humuya River will be diverted by an arrangement of two cofferdams and one diversion tunnel. An underground power station will be located next to the canyon wall. Systematic rock supporting, impermeabilization treatment, and leakage drainage are planned. A 600 meter tunnel will provide access from the road to the power station. Financing for the $582.7 million project will be provided by international financial institutions, the Honduras government, suppliers, and commercial banks. (Cassar-FRC)

PUMPED-STORAGE DEVELOPMENT IN BRAZIL, PART III,
Centrais Eletricas Basilieras S. A., Rio de Janeiro (Brazil).
R. M. Ciarlini, and W. Jordao.
International Water Power and Dam Construction, Vol 33, No 3, p 40-42, March, 1981. 2 Fig, 3 Tab.

Descriptors: *Pumped storage, *Hydroelectric plants, *Peak loads, Powerplants, *Brazil, Planning, Electric powerplants, Dam design, Reservoir design.

In the final part of a three-part series, four sites for proposed pumped storage plants for peak power supply in Brazil are described. These projects, Pacatuba (near Fortaleza), Amaraji (near Recife), Pedra do Cavalo (near Salvador), and Primavera, vary from 500 to 1000 MW. Some plan to use existing upper or lower reservoirs and spillways to reduce capital costs. Since all available heads in existing hydroelectric plants are under 100 meters, it is not economical to convert from base load to peak load plants. The excellent pumped-storage potential in Southeastern Brazil ensures a good selection of inexpensive projects with investment costs in the range of $200-260/kw. At some of the proposed sites, slow reservoir filling or pumping of water from nearby rivers may be necessary in order to avoid depleting local stream and groundwater. Pumped storage facilities can provide low cost energy for peak consumption periods, reducing the needed capacity of future hydroelectric plants. (Cassar-FRC)

WHY BOTHER WITH HISTORIC PRESERVATION,
National Trust for Historic Preservation, Washington, DC.
R. Wilson, and D. C. Jackson.
Civil Engineering (New York), Vol 51, No 2, p 66-67, February, 1981.

Descriptors: *Construction, *Archaeology, *History, Preservation, Civil engineering, Engineering, *Dams, Earthquakes, Check structures.

Just as the excavation of prehistoric remains has been thought to delay construction projects, it has also been argued that the avoidance of historical engineering structures or their removal to safety is a waste of time and money. Archeological resources within a construction project area will almost always be adversely affected by the construction activity. Once they are destroyed, they cannot be replaced or reconstructed. If there is no alternative to destruction of an important archeological site, time and access should be provided for scientific study before the site is destroyed. The Archeological and Historic Preservation Act of 1974 incorporates specific language which ensures that future archeological study will not unduly delay construction without recompense. Two examples of historical dams are used to illustrate how an understanding of and appreciation for engineering history helped to resolve a modern problem. In one case, a contractor exposed a large wooden structure during excavation for a sewer line. After the Advisory Council on Historic Preservation halted construction, it was discovered that the structure was part of a timber dam built to impound the waters of a lake only 25 feet from the sewer trench. The trench was realigned to avoid any direct impact on the dam. The Littlerock Dam is a reinforced concrete, multiple arch dam constructed in 1923-1924. The California Department of Water Resources attempted to force drainage of the dam in 1977 on the basis of earlier studies suggesting the dam was unsafe. An independent in-depth study of the design employed showed that the engineering characteristic of the dam, when considered as a whole, made it safe in withstanding earthquakes and capable of handling heavy rains. Court action has resulted in the continued operation of the dam, which operated successfully during heavy floods in 1978. (Carroll-FRC)

POWER CHARACTERISTIC CURVE OF HYDRAULIC TURBINE SET,
Yu. U. Edel, L. P. Mikhailov, A. M. Chistyakov, and Yu. A. Kharlamov.
Hydrotechnical Construction, No 9, p 941-944, September, 1980. 3 Fig, 4 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 9, p 38-40, September, 1980.

Descriptors: *Turbines, *Head loss, *Design criteria, Hydraulic design, Hydraulic structures, Hydraulic turbines, Penstocks, Corrosion, Nozzles, Operating policies, Power characteristic curves.

The power characteristic curve of a hydraulic turbine, furnished by the manufacturer, reflects the relation among turbine efficiency, allowable draft head, capacity, and head acting on the turbine. This curve does not consider the head losses in the head and tailrace conduits (turbine set). The operating characteristic curves for a 3-turbine high head plant are shown as follows: (1) turbine efficiency for 1 turbine, (2) turbine efficiency for 3 turbines, (3) turbine set efficiency for 1 turbine with new penstock, (4) the same, with a corroded penstock, (5) turbine set efficiency for 3 turbines with new penstock, (6) the same, with a corroded penstock, and (7) efficiency of turbine and turbine set for turbines operating on 3 out of 6 nozzles. The first 4 curves were close, differing by no more than 1.5% at full capacity (54.6 MW each turbine), and less at partial capacity. There was a 5% difference in efficiency at full capacity between curves (2) and 85) and 10% between curves (2) and (6). Maximum efficiencies for each turbine were about 91% at 26-40 MW for the first 4 curves, 90% at 24-30 MW for (5), 89% at 20-28 MW for (6), and 91% at 20 MW for (7). At low heads, differences between optimal regimes of the turbine and turbine set are small enough to ignore. The operating curve of the turbine set should be included in the design procedure. It may show that the turbine dimensions and/or specific speeds should be increased. (Cassar-FRC)

ABSOLUTE ROUGHNESS OF CONCRETE-LINED CHANNELS,
Department of Water Affairs, Pretoria (South Africa).
J. P. Pansegrouw.
Civil Engineer in South Africa, Vol 23, No 7, p 307, 309, 311, 313, 316, July, 1981. 8 fig, 3 Tab, 10 Ref.

Descriptors: *Roughness coefficient, *Channels, Mannings equation, *Linings, Concrete technology, *Concretes, Hydraulics, *South Africa, Concrete lined channels.

Observations were made at four major schemes of the South African Department of Water Affairs, Forestry and Environmental Conservation on absolute roughness and Manning n values in concrete-lined canals. During the study a number of important advantages of the method using roughness measurements to determine friction coefficients such as Manning n values were observed on site. When compared with the method of estimating Manning n values from the general appearance of cross-sections or from illustrations in textbooks, the roughness method has the advantage of minimizing errors due to faulty or subjective misinterpretations. This is particularly the case when friction coefficients are to be appraised for complex sections with composite roughness characteristics. No major disadvantages of the roughness method could be reported, except that roughness measurements can only be taken during dry or virtually dry periods. This could not be considered to be a real obstacle, however, as it is always advisable to inspect the wetted perimeter of any conveyor on site and to take actual measurements of the cross-sections to establish the hydraulic radius, regardless of the method used to determine friction coefficients in practice. INFLOW PREDICTION AND COOPERATIVE OPERATION OF PUMPS, VALVES AND GATES IN STORM WATER DRAINAGE SYSTEM,
Hitachi Ltd. Kawasaki (Japan). Systems Development Lab.
M. Shioya, S. Shimauchi, H. Ogasawara, and T. Ohto.
Water Science and Technology, Vol 13, No 8, p 61-67, 1981. 6 Fig, 3 Tab, 2 Ref.

Descriptors: Regression analysis, *Drainage systems, Prediction, *Control systems, Pumps, Valves, Combined sewer overflows, Storm drains, *Storm sewers, Storm water, Storm runoff, Mathematical studies, Forecasting, Intake gates, Sewer systems, Combined sewers, Overflow control.

The possibility of inflow prediction using data from an actual pump station and the simultaneous operation of control pumps, valves and gates to prevent overflows during storm conditions are examined. A multiple regression analysis was used to

assess the potential accuracies of short time range inflow predictions. For time ranges of 10, 20 and 30 min, the means of the absolute values of the relative prediction errors were 0.24, 0.35 and 0.36, respectively, corresponding to 43.0, 52.5 and 53.3% of the discharge quantity of a pump handling 200 cu m/min. Short time range predictions were deemed adequate for pump operation control when a stand-by pump was provided. To handle excess stormwater, a control system of gates, pumps and valves was devised which determines the opening angle of gates or valves and the number of pumps required to prevent overflow. This control scheme may also function during partial failure of routine drainage operations. The present technology is recommended for future total control systems for entire combined storm drainage-sewer systems. (Geiger-FRC)

8D. Soil Mechanics

CRACKING, LEAKAGE, AND EROSION OF EARTH DAM MATERIALS,

Trondheim Univ. (Norway).
E. I. Hjeldnes, and B. V. K. Lavania.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No GT2, p 113-135, February, 1980. 1 Tab, 13 Fig, 15 Ref.

Descriptors: *Erosion, *Construction methods, *Dams, *Earth dams, *Rockfill dams, Tension, Finite element analysis, Soil properties, Soil tests, Soil types, Soil stability, Hydraulics, Fluid mechanics, Flow characteristics, Experimental design, Design criteria, Dam stability.

A laboratory approach to determining the cracking, leakage, and erosion properties of soil simultaneously is described. This approach is intended for use in studies of the stability of earth dams and for selection of suitable core materials. With this method, a soil sample is encased in a hollow cylindrical apparatus. It is given a vertical pull, at a predicted rate of tensile deformation, to develop cracking in a horizontal plane at the center height. The desired hydraulic gradient is applied through it at the fracture plane; the leak discharge and the soil contents in the discharge are measured during the tests. The observations are then plotted to characterize the properties. The applicability of the approach has been demonstrated by testing two soil types, a silty-gravelly sand and a silty-clayey fine sand. Results showed that the silty-gravelly sand is superior to the silty-clayey fine sand for use in an earth dam because it has self-healing response to erosion and is more leak and crack resistant. METHOD OF DETERMINING MECHANICAL CHARACTERISTICS OF COARSE SOILS,

O. A. Pakhomov.
Hydrotechnical Construction, No 4, p 370-374, April, 1980. 5 Fig, 5 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 4, p 26-29, April, 1980.

Descriptors: *Soil physical properties, *Cohesionless soils, Soil mechanics, Soil physics, Model studies, Particle size, Shear tests, Compressibility, Dam construction, Earth dams, Rockfill dams, *Hydraulic structures.

A successive approximation method was developed to determine the mechanical characteristics of coarse soils used in constructing foundations for hydraulic structures. The new method does not have the limitations of commonly used procedures, which can only be used for soils with small differences in grain size. Five or six prototype mixtures of coarse soil are analyzed for particle size distribution and curves are prepared. Laboratory tests on specimens are conducted using consolidometer, stabilometer, shear apparatus, etc. A graphic relation between the investigated characteristics and the uniformity coefficient is plotted and an empirical equation selected. Extrapolation of the investigated relation produces the desired characteristic of the soil from the prototype particle size distribution for various load increments. Increases in modeling scale increase the error, but an accuracy of 5% may be attained with proper selection of the test unit dimensions. The method is illustrated by determination of compressibility and shear strength of a gravel-pebble soil. Specimens were 620 mm in diameter; the maximum size of prototype material was 200-500 mm. Five model mixtures were prepared by successive screening of fractions larger than 80, 40, 20, 10, and 5 mm. (Cassar-FRC)

CALCULATION OF EARTH DAMS BEING UNDERMINED,

A. K. Bugrov, and V. F. Markevich.
Hydrotechnical Construction, No 4, p 366-369, April, 1980. 3 Fig, 9 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 4, p 24-26, April, 1980.

Descriptors: *Subsidence, *Dam stability, *Stress analysis, *Soil mechanics, *Earth dams, Soil dynamics, Mining engineering, Deformation, Strain, Elastic properties, Plasticity, Dam foundations.

The mixed problem of plane strain is solved for a 30 meter high earth dam located within the marginal part of a subsidence trough caused by mining of a potassium mineral deposit. Spreading of the ground surface is the characteristic form of deformation in the marginal areas. The stress and strain of earth fills can be calculated by considering elasticity and plasticity. A figure shows the plastic regions for various values of spreading (horizontal extension strains). The mixed problem gives a more realistic picture of strains than a linear solution. The mixed problem is also applied to calculating the parameters of a subsidence trough. (Cassar-FRC)

EARTH-FILLED SLURRY WALLS PROVIDE ECONOMICAL SEEPAGE CONTROL,

R. A. Antonino.
Civil Engineering (New York), Vol 50, No 4, p 72-74, April, 1980. 3 Fig.

Descriptors: *Trenches, *Slurries, *Seepage control, Bentonite, Cofferdams, Backfill, Dewatering, Tombigbee River, Dam construction, Construction, Locks, Earth dams, Soil mechanics, Excavation, Waterways.

Slurry trench cutoff walls have been efficient, effective, and economical at two sites under construction at the Tennessee-Tombigbee Waterway for excluding groundwater during excavation and subsequent concrete construction. Although this technique is often used for seepage control after construction, it is unusual to use it during both excavation and construction. In addition, the slurry is unusual--a mixture of graded, select fill material and bentonite. At the Aliceville Lock and Dam site a cofferdam 2 km in circumference encircling 64 acres has an earth slurry wall 3 ft wide and 30 ft long extending from inside the cofferdam to an impervious underlying clay stratum. After building the cofferdam 6 ft high, the slurry trench was dug down to the impervious layer and filled with the mixture. The trench was then backfilled with slurry and soil until the wall extended along the perimeter of the circumferential trench. The remainder of the cofferdam fill was added to the working surface to bring the embankment to full height. The earth-slurry walls, in place for two years, have shown excellent seepage control. Costs are limited to the installation cost. There are no operating costs as in dewatering systems using pumps and wells. (Cassar-FRC)

RESPONSE OF BURIED STRUCTURES TO TRAVELING WAVES,

California Univ., Berkeley. Dept. of Civil Engineering.
R. N. Hwang, and J. Lysmer.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No GT2, p 183-200, 1981. 9 Fig, 2 Tab, 14 Ref.

Descriptors: *Seismic waves, *Pipelines, *Underground structures, Waves, Construction, Strain, Strain measurement.

The response of underground structures such as pipelines to traveling seismic waves is discussed. A new approach is presented for computing the response of these structures using the finite element method. Soil structure systems are represented by three-dimensional finite elements. Using a special type of wave-transmitting element, a three-dimensional system can be reduced to a plane of finite elements with three degrees of freedom at each node while the traveling effects of waves are retained. Large structures were found to significantly reduce computed strains, probably because the rigidity of the structures provides resistance to deformation. Thus, large structures should not necessarily be designed based on strains developed in the free field. Also, the assumption of vertically propagating waves was found inadequate for predicting stresses and strains induced in underground structures. Proper consideration must be given to the traveling effects of waves in the design. (Small-FRC)

NEW TECHNICAL SOLUTIONS USED FOR CONCRETING TUNNELS OF THE NUREK HYDROELECTRIC PLANT,

G. P. Kopyshev, S. V. Shutenkov, A. S. Efimov, V. A. Serebryakov, and I. I. Mel'nikov.
Hydrotechnical Construction, No 9, p 885-891, September, 1980. 5 Fig. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 9, p 7-10, September, 1980.

Descriptors: *Underground structures, *Hydroelectric plants, *Tunnel linings, Water transport, Concrete technology, *Hydraulic structures, Linings, *Nurek Hydroelectric plant, USSR, Diversion structures.

New concrete technology was developed for constructing the reinforced concrete linings of three 10 m diameter headrace tunnels and the troughs of the horseshoe-section diversion tunnels in the Nurek hydroelectric plant, U.S.S.R. A OKSh-10 circular walking formwork increased productivity because a railway track was not necessary and because placing and replacing of the formwork was mechanized. A special trough concreting UBL installation permitted mechanized railway track placement. These technical solutions increased the quality and efficiency of the construction. (Cassar-FRC)

CONCRETE OF THE DAM OF THE KIROVSKOE RESERVOIR,
L. M. Gerkan, T. S. Vorotovova, E. S. Zhirkov, and T. E. Nikitina.
Hydrotechnical Construction, No 2, p 153-157, February, 1980. 3 Fig, 4 Tab. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 2, p 27-29, February, 1980.

Descriptors: *Dam construction, *Concrete technology, *Kirovskoe Reservoir, *Buttress dams, Companion studies, Design, Construction materials, Technology, USSR.

Kirovskoe, the concrete buttress dam constructed in 1971-75 on the Talas River, U.S.S.R., used 2 grades of concrete: 279,000 cu meters of 25 MPa and 50,000 cu meters of 20 MPa. The latter was used in buttresses and downstream heads of the sections. Tests of the concrete after construction showed that it conformed to design specifications with respect to compressive strength and cleavage tensile strength. Laboratory tests showed that concrete homogeneity improved as the project progressed because of improvements in preparing the aggregates and in manufacturing and installing the concrete mix. (Cassar-FRC)
W82-03159

CAVITATION RESISTANCE OF CONCRETE,
Y. P. Inozemtsev.
Hydrotechnical Construction, No 2, p 158-160, February, 1980. 1 Fig, 11 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 2, p 30-31, February, 1980.

Descriptors: *Cavitation, *Concrete mixes, *Aggregates, Erosion, Gravel, *Hydraulic structures, Design criteria.

Comments on a paper by Moskin (1978) on cavitation erosion of concrete hydraulic structures are given. Moskin advocated use of broken stone instead of gravel to improve cavitation resistance. This is criticized on 3 grounds: (1) broken stone in place of gravel does not improve cavitation resistance, (2) more cement is required and the resulting higher heat produced increases the likelihood of thermal cracking, and (3) broken stone is scarce in remote regions. Descriptors: *Linings, *Channel improvement, Polymers, Plastics, Canal linings, Canals, *Seepage control, Materials, *India, Punjab area.

Seepage losses have been observed from various distributaries and watercourses in different areas of Punjab, India. The losses observed after lining showed that considerable savings in seepage losses were effected due to the application of the lining. A combination type of lining was developed which is quite suitable for lining the existing distributaries and minors. The time needed to line pipes with this method is short, and lining can be executed during short closures of the channel. The combination lining fulfills the requirements of durability, impermeability and hydraulic efficiency. The lining is not affected by animal traffic nor by weathering conditions. The cost of the lining is low compared with other types of linings. The lining is a 400 garge polythene film under 30.0 cm thick soil cover for lining at the bed. In the case of channels which are not in regime, polythene film at the bed is also overlaid with brick masonry. To improve the bond between the PE film and the brick masonry, bitumen emulsion was applied cold on the PE film and sand was sprayed before laying the brick masonry. (Baker-FRC)

EVALUATION OF THE MECHANICAL PROPERTIES OF THE MASS OF A CONCRETE DAM WITH INTERBLOCK JOINTS,
K. A. Abadzhyan, E. S. Argal, and V. M. Korolev.
Hydrotechnical Construction, No 9, p 901-909, September, 1980. 5 Fig, 7 Tab, 5 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 9, p 15-20, September, 1980.

Descriptors: *Concrete testing, *Deformation, *Grouting, Dam stability, Physical properties, Stress analysis, Strain measurement, Compressibility, Materials engineering, Strength, Cracks, *Hydraulic structures.

The deformability and character of fracture of interblock (nongrouted) and grouted joints were investigated on plaster-sand and concrete specimens using resistance strain gages. A mass with undisturbed joints in compression across the joints is as strong as or stronger than a monolith. Cracks in monolithic specimens develop parallel to the direction of action of the compressive forces. When cracks form in a jointed mass, they develop in the same direction but usually end at a joint, promoting better redistribution of stresses. Masonry with joints, either grouted or nongrouted, has increased deformability, but the average modulus of deformation under compression can be assumed equal to the modulus of deformation of the concrete. UNDERGROUND AND OFFSHORE: WHEN TO CONSIDER CATHODIC PROTECTION,
Hinchman Corp., Detroit, MI.
A. L. Claes.
Consulting Engineer, Vol 54, No 3, p 89-92, March, 1980. 9 Fig.

Descriptors: *Corrosion control, *Cathodes, *Underground structures, Conveyance structures, *Pipelines, Water mains, Storage tanks, Coatings, Protective coatings, Anodes, Electrodes, Inspection, Maintenance.

Cathodic protection is an effective corrosion control method for structures immersed in water or buried in earth, such as pipelines, water lines and tanks, and sewage lines and outfalls. Direct current discharged through anodes travels through soil or water to the structure (the cathode) to be protected. Corrosion occurs only at the anode, which is periodically replaced, sparing the structure. The battery operated, low amperage and voltage galvanic anode system is used for structures with small current requirements--small coated pipes, sewage lift stations, etc. The impressed current system, externally powered and more flexible, can handle several hundred amperes and is used for structures with large current requirements, bare pipes and large cast iron water lines. Cathodic protection works most efficiently when coordinated with protective coatings and other corrosion control methods. Proper maintenance includes anode replacements and regular inspections, especially after any structural changes. (Cassar-FRC)

WASTEWATER TREATMENT: CORROSION SOLUTION ARE AS VARIED AS PROBLEMS,
Engineering Science, Inc., Atlanta, GA.
D. Burstein, and T. Franklin.
Consulting Engineer, Vol 54, No 3, p 83-88, March, 1980. 2 Tab.

Descriptors: *Corrosion control, *Hydrogen sulfide, *Industrial wastes, Wastewater treatment, Sulfuric acid, Cavitation, Aeration, Metals, Maintenance, Coatings, Plastics, *Wastewater treatment facilities.

A major maintenance problem in industrial wastewater treatment facilities is corrosion, caused by three basic mechanisms: erosion and cavitation, chemical attack, and galvanic and electrochemical attack. Corrosion attacks not only metal equipment, but also concrete, especially in material alternately wet and dry. Factors promoting corrosion are: low pH, high temperature, dissolved oxygen, dissolved salts, and high fluid velocity. A common corrosive material in the treatment process is sulfuric acid, formed from hydrogen sulfide in contact with wet equipment, Four basic methods are used in corrosion control in wastewater facilities: elimination of the corrosive agent or environment, use of protective liners and coatings, use of galvanic and impressed current protection devices, and use of corrosion resistant materials. H2S formation may be prevented by maintaining sufficient oxygen in the sewers entering the plant by injecting air into the wastewater or by adding chlorine. Corrosive vapors may be exhausted. Many specialized coatings are available for corrosion protection--painting, epoxy coatings, and plastic base liners and coatings. Corrosion resistant materials which may be used are: plastics (lowest cost), nonferrous metals, stainless steel (usually AISI Types 302, 304, and 316), and acid-resistant concrete. (Cassar-FRC)

CORROSION ROUNDTABLE--OPPORTUNITIES/PITFALLS FOR NEW MATERIALS,
M. Garbrecht.
Consulting Engineer (St. Joseph), Vol 54, No 3, p 70-80, March, 1980.

Descriptors: *Resins, *Corrosion control, *Materials engineering, Standards, Quality control, Wastewater treatment facilities, Engineering, Research priorities, Design standards, Legal aspects.

A panel discussion on new materials for corrosion prevention centered on fiberglass reinforced polyester resins (FRP) and included several points relevant to the water and wastewater industry. One problem in selecting materials for water plants is that the users often resist the idea of spending extra money for long term corrosion prevention. The uncertainty in the performance of unproven materials and the lack of sophistication of many clients causes engineers to use tried and true materials, rather than the innovative alternatives. There are many similar FRP plastic materials available, and as yet no standards and codes to give confidence to the users. Quality assurance is difficult. Newer wastewater process and complex industrial sludges present more exotic corrosion problems than in the past. In some cases, historically used materials are not applicable and FRP appears promising. Nevertheless, the tendency toward litigation in the case of failure makes engineers very cautious in specifying polyester resins. The record of FRP has been mixed to date. In one instance it was found that a piping system with 23,000 feet of pipe, many turns and bends, and thousands of fittings had only three leaks. In another case, a chemical waste storage tank failed because the designers did not consider the fact that benzene in the waste would destroy the resins. The panel urged more education and information dissemination, codes and standards, and more innovative applications of FRP. (Cassar-FRC)

STOPPING WATER WITH CHEMICAL GROUT,
Avanti International, Houston, TX.
W. B. Jaques.
Civil Engineering (New York), Vol 51, No 12, p 59-62, December, 1981. 1 Fig, 1 Tab.

Descriptors: *Waterproofing, *Oil sealants, *Grouting, Tunnels, Acrylamide grouts, Urethane grouts.

Chemical grouts are available to control water movement in soils, to repair sewer leaks, for waterproofing structures, and to stabilize incompetent soils. Unlike cements or epoxy resins applied to the inside of tunnels or foundations, the chemical grouts treat the water problem on the wet side of the structure. Several basic families are available. The most common is acrylamide grout, which requires three chemicals mixed at the time of use to form a solid material after a predetermined gel period. Although acrylamide grouts are not currently manufactured in the U.S., they are legal to use and may be imported. Urethanes may form stiff gels or foams. These materials have a wide range of applications, including one approved for potable water applications. Polyacrylamides include Injectite-80, a sewer sealing grout. AC-400, an acrylate, is specifically designed for controlling infiltration in sewer joints, but has also been used in tunnel sealing. Chemical grouts start as thin solutions which flow like water into very fine spaces between soil particles. Zones of any desired shape may be constructed--vertical walls, horizontal layers, and surrounding tunnels. (Cassar-FRC)

Evaluation of the Mechanical Properties of the Mass of a Concrete Dam with Interblock Joints,
W82-03158 8G

DENITRIFICATION
Biological Nitrogen Control of Industrial Wastewater,
W82-03131 5D

Biological Nitrogen Removal System Design,
W82-03145 5D

The Activated Sludge Process--3. Single Sludge Denitrification,
W82-03223 5D

Improved Performance in Combined Nitrification/Denitrification of Tannery Waste,
W82-03277 5D

DENMARK
Water Supply in Denmark,
W82-03274 6D

Diversion of the River Neva,
W82-03304 4A

DENVER
Energy Minimization at Metro Denver Sewage District,
W82-03142 5D

DEPOSITION
Major Evaporite Deposition from Groundwater Remobilized Salts,
W82-03339 5B

DESALINATION
Health Aspects of Water Desalination,
W82-03116 3A

Artificial Particulate Fouling of Hyperfiltration Membranes IV. Dynamic Protection from Fouling,
W82-03288 3A

DESERT PLANTS
Patterns of Water Potential and Photosynthesis of Desert Sand Dune Plants, Eureka Valley, California,
W82-03271 2I

DESERTS
Patterns of Water Potential and Photosynthesis of Desert Sand Dune Plants, Eureka Valley, California,
W82-03271 2I

DESIGN
GAO Finds Massive Failure of Wastewater Treatment Plants,
W82-03299 5D

DESIGN CRITERIA
Troubleshooting and Control of Nitrification Wastewater Treatment Systems,
W82-03135 5D

Warming Up to Geothermal,
W82-03156 8A

Power Characteristic Curve of Hydraulic Turbine Set,
W82-03163 8B

Calculator Program Aids Lagoon Design,
W82-03211 6A

Note on Design of Diffusers for Sewage Outfalls Based on the Work of Rawn Et Al,
W82-03347 5E

DETENTION RESERVOIRS
A Planning Method for Evaluating Downstream Effects of Detention Basins,
W82-03089 4A

Stormwater Detention in Developing Watersheds,
W82-03363 4A

DETERGENTS
Detergent Builders and Water Quality - A Changing Scene,
W82-03093 5C

DETOXIFICATION
Detoxification of Zinc and Cadmium by the Freshwater Protozoan Tetrahymena Pyriformis. II. Growth Experiments and Ultrastructural Studies on Sequestration of Heavy Metals,
W82-03334 5G

DEVELOPING COUNTRIES
Design and Fabrication of a Low Cost Package Water Treatment Plant for Rural Areas in India,
W82-03115 5F

Who Will Pay the World's Water Bill,
W82-03280 6B

DEW
Dew Fall in the Dry Climatic Zones of India,
W82-03278 2B

DEWATERING
Fine Coal-Refuse Slurry Dewatering,
W82-03049 5D

DEWPOINT
The Relationship Between Total Precipitable Water and Surface Dew Point,
W82-03257 2B

DIATOMS
Response of Phytoplankton to Acidification in Experimental Streams,
W82-03036 5C

DIFFUSION COEFFICIENT
Molecular Diffusion and the Sedimentary Environment: Results from the In Situ Determination of Whole Sediment Diffusion Coefficients,
W82-03091 2J

Molecular Approach to the Foundations of the Theory of Solute Transport in Porous Media. I. Conservative Solutes in Homogeneous Isotropic Saturated Media,
W82-03316 2F

The Measurement of Diffusion Coefficients in the Conwy Estuary,
W82-03388 2L

DILUTH
Duluth Sanitary District First in U.S. to Take Charge of Both Sewage and Refuse.
W82-03249 5E

DISASTERS
Emergency Water Supply General Report No. 2, Concept for an Emergency Water Supply in Switzerland,
W82-03221 5F

DISCHARGE MEASUREMENT
Methods of Discharge Compensation as an Aid to the Evaluation of Water Quality Trends,
W82-03056 7B

DISCHARGE (WATER)
GAO Finds Massive Failure of Wastewater Treatment Plants,
W82-03299 5D

DISINFECTION
Virus Inactivation in Wastewater Effluents by Chlorine, Ozone, and Ultraviolet Light,
W82-03005 5D

Inactivation of Enteroviruses by Ozone,
W82-03208 5F

DISSOLVED OXYGEN
Studies of the Hydrobiology of a Tropical Lake in Northwestern Queensland. II. Seasonal Changes in Thermal and Dissolved Oxygen Characteristics,
W82-03218 2H

The Concentration and Isotopic Fractionation of Gases Dissolved in Freshwater in Equilibrium with the Atmosphere. I. Oxygen,
W82-03325 1B

DISTRIBUTION COEFFICIENTS
Treatability of Toxic Wastewater Pollutants by Solvent Extraction,
W82-03127 5D

DISTRIBUTION PATTERNS
Estimating Distribution Uniformity in Level Basins,
W82-03058 3F

DISTRICT OF COLUMBIA AREA
Entrenchment of Sewage Sludge--A Disposal-Use Alternative,
W82-03353 5E

DIVERSION
The El Cajon Hydro Project in Honduras, Part Two,
W82-03332 8A

DIVERSION LOSSES
Diversion of the River Neva,
W82-03304 4A

DOLOMITE
Verification of the Potential Yield and Chemical Quality of the Shallow Dolomite Aquifer in Dupage County, Illinois,
W82-03100 2F

DOUGLAS FIR
Water Use Efficiency in Douglas Fir: The Nature of Plant Response to Selected Environmental Variables,
W82-03019 2I

DRAINAGE
Zinc Deficiency in Wetland Rice Along a Toposequence of Hydromorphic Soils in the Philippines. I. Soil Conditions and Hydrology,
W82-03328 2G

DRAINAGE DITCHES
The Ecology of a Land Drainage Channel--I. Oxygen Balance,
W82-03306 4A

DRAINAGE ENGINEERING
Evaluation of the Effectiveness and Reliability of Drains of the Tailrace of the Plyavinyas Hydroelectric Station,
W82-03161 8A

DRAINAGE SYSTEMS
Inflow Prediction and Cooperative Operation of Pumps, Valves and Gates in Storm Water Drainage System,
W82-03068 8C

Aquatic Weed Research in Britain,
W82-03187 4A

DRAWDOWN
A Numerical Method for the Calculation of the Average Drawdown in a Fully Penetrating Observation Well in an Unconfined Aquifer,
W82-03061 2F

DREDGING
Graphs for Saline Wedges in Estuaries,
W82-03351 2L

DRILLING EQUIPMENT
Warming Up to Geothermal,
W82-03156 8A

DRINKING WATER
Physiochemical Speciation of Lead in Drinking Water,
W82-03198 5F

Fluoride Determination in Water: An Optimum Buffer System for Use with the Fluoride-Selective Electrode,
W82-03259 5F

DROUGHT
An Economic Analysis of Water Conservation Policy,
W82-03090 6B

Will the Sahelian Drought End in 1985,
W82-03167 2B

Reliability Programming in Reservoir Management 2. Risk-Loss Functions,
W82-03245 6A

A Perspective Study of Droughts in Mexico,
W82-03358 2E

Jersey Drought Hastens Water Supply Project,
W82-03385 6D

DROUGHT RESISTANCE
Cereal Yields and Drought Resistance,
W82-03195 2I

DUCKWEED
Lemna (Duckweed) as an Indicator of Water Pollution. I. The Sensitivity of Lemna Paucicostata to Heavy Metals,
W82-03318 5A

EARTH DAMS
Cracking, Leakage, and Erosion of Earth Dam Materials,
W82-03149 8D

Calculation of Earth Dams Being Undermined,
W82-03162 8D

ECOLOGICAL EFFECTS
Susceptibility of Aquatic Ecosystems to the Effects of Atmospheric Pollutant Fallout in Quebec.
W82-03106 5C

A Model River Test to Describe the Various Impacts of Chemical Substances on Microbial Biocommunities,
W82-03147 5C

Chemical Flux in an Acid-Stressed Stream,

ENTERIC BACTERIA
Water Quality Analyses of the Colorado River Corridor of Grand Canyon,
W82-03017 5A

ENTEROVIRUSES
Inactivation of Enteroviruses by Ozone,
W82-03208 5F

ENVIRONMENTAL EFFECTS
Cooling Water Discharge into Floodplain Meadows and Marshes: Effects, Mechanisms, and Implications for Environmental Analysis,
W82-03022 5C

Final Environmental Impact Statement; North Fork Payette River Project FERC No. 2930-IDAHO.
W82-03046 6G

Provision of Energy Requirements for Remote Communities by Small-Scale Hydro Development,
W82-03151 8A

Salinity and Biogenic Material in the North Caspian,
W82-03155 4A

Biological Monitoring Part VI - Future Needs,
W82-03230 5C

Don't Damn the Stanislaus,
W82-03275 6E

ENVIRONMENTAL IMPACT STATEMENT
Final Environmental Impact Statement; North Fork Payette River Project FERC No. 2930-IDAHO.
W82-03046 6G

ENVIRONMENTAL POLICY
EPA's Approach to Regulating New Energy Technologies,
W82-03129 6E

ENVIRONMENTAL PROTECTION
ICI Brixham - Environmental Research in the Private Sector.
W82-03153 5D

EPHEMERAL STREAMS
Experimental Studies of the Effects of Ephemeral Streamflow Depths on Infiltration,
W82-03013 2A

EPIDEMIOLOGY
Epidemiological Studies of Otitis Externa: Repot of a Prospective and of a Retrospective Study of Otitis Externa Among Swimmers,
W82-03027 5C

EROSION
Cracking, Leakage, and Erosion of Earth Dam Materials,
W82-03149 8D

Palaeoecological Studies of Lakes in the Highlands of Papua New Guinea. I. The Chronology of Sedimentation,
W82-03235 2J

Don't Always Put Dam in Narrowest Part of Valley,
W82-03282 8A

EROSION CONTROL
How About Reverse Filters,
W82-03247 4D

ERROR ANALYSIS
A Model of Discontinuous Measurement Error and Its Effects on the Probability Distribution of Flood Discharge Measurements,
W82-03076 2E

Flow in Aquifers with Clay Laminae 2. Exact Solutions,
W82-03232 2F

ESCHERICHIA COLI
Improved Microbe Detection in Water Samples.
W82-03258 5A

Direct Influence of Wastewater Pollutants on Flocculation and Sedimentation Behavior in Biological Wastewater Treatment-I. Model System E. Coli B,
W82-03319 5D

ESK ESTUARY
Alpha-Particle Radioactivity of Hot Particles from the Esk Estuary,
W82-03345 5A

ESTIMATING EQUATIONS
The Relationship Between Total Precipitable Water and Surface Dew Point,
W82-03257 2B

ESTUARIES
Distribution of Anoplostoma Viviparum (Nematoda) in Southampton Water Sediments,
W82-03343 2L

Alpha-Particle Radioactivity of Hot Particles from the Esk Estuary,
W82-03345 5A

Availability of Dissolved Free Glucose to Heterotrophic Microorganisms,
W82-03359 2L

Radar Measurements of Estuarine Currents and Tides,

GROUNDWATER POLLUTION
Restoring Ground Water Quality Following in Situ Leaching,
W82-03050 5D

Septic Sewage Systems Contaminate Ground Water.
W82-03378 5B

GROUNDWATER POTENTIAL
Final Report, Ground Water Study, Ames-Cambridge Reach of the Skunk River, Story County, Iowa,
W82-03112 2F

GROUNDWATER RECHARGE
Recharge Mechanisms and Groundwater Flow in the Chalk and Drift Deposits of Southern East Anglia,
W82-03182 2F

GROUTING
Evaluation of the Mechanical Properties of the Mass of a Concrete Dam with Interblock Joints,
W82-03158 8G

Grouting Works in the Diversion Tunnel of the Inguri Hydroelectric Station,
W82-03164 8A

Stopping Water with Chemical Grout,
W82-03396 8G

GROWTH KINETICS
Dynamics of Bacterial Sulfate Reduction in a Eutrophic Lake,
W82-03119 2H

Phosphorus-Limited Growth of a Green Alga and a Blue-Green Alga,
W82-03120 2H

GULF OF SIRTE
Major Evaporite Deposition from Groundwater Remobilized Salts,
W82-03339 5B

GULFS
Zinc in Seawater and Sediments,
W82-03166 5B

HAIL
Reciprocating Hail Processes in the Alps,
W82-03227 2B

HALIFAX HARBOR
Molecular Diffusion and the Sedimentary Environment: Results from the In Situ Determination of Whole Sediment Diffusion Coefficients,
W82-03091 2J

HAMILTON HARBOR
Physical Variability and Phytoplankton Communities IV. Temporal Changes in the Phytoplankton Community of a Physically Variable Lake,
W82-03229 2H

HARBORS
Orthophosphate Uptake by Phytoplankton and Bacterioplankton from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03172 5B

Effects of Eutrophication on the Intertidal Ecology of Langstone Harbour, U.K. and Proposed Control Measures,
W82-03207 5C

HARDNESS
Precipitation Kinetics of Calcium Carbonate and Magnesium Hydroxide in a Scaling System,
W82-03136 2K

HAWAII
Application of a Single Reservoir Operation Policy to a Rain Water Cistern System,
W82-03088 3B

HAZARDOUS MATERIALS
1981 Annual Report - Committee on the Assessment of Human Health Effects of Great Lakes Water Quality.
W82-03104 5A

Ozone for the Treatment of Hazardous Materials,
W82-03139 5D

HEAD LOSS
Power Characteristic Curve of Hydraulic Turbine Set,
W82-03163 8B

HEAT TRANSFER
Design and Economics of a Solar Heater Aquifer Storage System,
W82-03143 4B

HEAVY METALS
Removal of Heavy Metals and Suspended Solids from Battery Wastewaters: Application of Hydroperm Cross-Flow Microfiltration,
W82-03037 5D

Treatment of Metal Containing Wastewater with Calcium Sulfide,
W82-03125 5D

Ozone for the Treatment of Hazardous Materials,
W82-03139 5D

Physiochemical Speciation of Lead in Drinking Water,
W82-03198 5F

Removal of Toxic Heavy Metal Ions from Wastewaters Using Modified Agricultural Waste Materials,
W82-03206 5D

Type A Zeolite in the Activated Sludge Process--II: Heavy Metal Removal,
W82-03222 5D

Trace Analysis of Toxic Metals. I. Determination of Lead, Mercury, Cadmium and Thallium by Amperometric Titration,
W82-03236 5A

Lemna (Duckweed) as an Indicator of Water Pollution. I. The Sensitivity of Lemna Paucicostata to Heavy Metals,
W82-03318 5A

Analysis of Trace Elements in Seawater. Part II. Determination of Heavy Metal Traces in Sea Water by X-Ray Fluorescence Analysis with Totally Reflecting Sample Holders,
W82-03333 5A

Detoxification of Zinc and Cadmium by the Freshwater Protozoan Tetrahymena Pyriformis. II. Growth Experiments and Ultrastructural Studies on Sequestration of Heavy Metals,
W82-03334 5G

Chelating Resin Catcher for Capture, Preconcentration and Determination of Toxic Metal Traces (Zn, Cd, Hg, Pb) in Waters (Capteur de Resine Chelatante Pour le Prelevement la Preconcentration et la Determination de Metaux Traces Toxiques (Zn, Cd, Hg, Pb) dans les Eaux,
W82-03379 5A

Trace Metal Speciation in the Freshwater and Estuarine Regions of the Yarra River, Victoria,
W82-03387 5B

HERBICIDES
Lake Deoxygenation After Herbicide Use: A Simulation Model Analysis,
W82-03113 5C

HETEROTROPHIC BACTERIA
Bacterial Utilization of Algal Extracellular Products. I. The Kinetic Approach,
W82-03330 5C

Bacterial Utilization of Algal Extracellular Products. 2. A Kinetic Study of Natural Populations,
W82-03331 5C

Availability of Dissolved Free Glucose to Heterotrophic Microorganisms,
W82-03359 2L

HIMALAYA MOUNTAINS
Contribution to High Altitude Limnology of the Himalayan System I. Limnology and Primary Productivity of the Plankton Community of Nilnag Lake, Kashmir,
W82-03314 2H

HISTORY
A Century of Water for Antwerp,
W82-03355 5F

Why Bother with Historic Preservation,
W82-03384 8A

HONDURAS
The El Cajon Hydro Project in Honduras, Part Two,
W82-03332 8A

HONG KONG ESTUARY
Variations in Benthic Community Structure in a Sub-Tropical Estuary,
W82-03169 2L

HUMAN DISEASES
Uptake of Vibrio Cholerae Biotype Eltor from Contaminated Water by Water Hyacinth (Eichornia Crassipes),
W82-03179 5B

The Gezira Scheme--A Study in Failure,
W82-03393 6B

HUMIC ACIDS
The Structure of Freshwater Humic Substances as Revealed by 13C-NMR Spectroscopy,
W82-03095 2H

Effects of Pollution on Humic Substances,
W82-03253 5C

HUMID AREAS
Dew Fall in the Dry Climatic Zones of India,
W82-03278 2B

HYDRAULIC MODELS
Hydraulic Model Studies of Theodore Roosevelt Dam - South Spillway,
W82-03051 8A

HYDRAULIC STRUCTURES
New Technical Solutions Used for Concreting Tunnels of the Nurek Hydroelectric Plant,
W82-03150 8F

Evaluation of the Mechanical Properties of the Mass of a Concrete Dam with Interblock Joints,

W82-03339 5B

LIMNOLOGY
Limnological Studies of a Freshwater Fish Pond at Burdwan, West Bengal, India,
W82-03186 2H

The Phosphorus Cycle in Germinston Lake. 1. Investigational Objectives and Aspects of the Limnology of the Lake,
W82-03234 2H

LININGS
Liners of Natural Porous Materials to Minimize Pollutant Migration,
W82-03028 5G

A Suitable Lining Technique for Existing Distributaries,
W82-03063 8G

Absolute Roughness of Concrete-Lined Channels,
W82-03397 8B

LOBSTERS
Arseno-Sugars from Brown Kelp (Ecklonia Radiata) as Intermediates in Cycling of Arsenic in a Marine Ecosystem,
W82-03183 5B

LOGGING
Effects of Clearcutting and Slashburning on Stream Temperature in Southwestern British Columbia,
W82-03087 5C

LONG ISLAND
A Finite Element Model for the Migration of Leachate from a Sanitary Landfill in Long Island, New York - Part II: Application,
W82-03220 5B

LONG-TERM PLANNING
Policies and Goals for California Water Management: The Next 20 Years.
W82-03111 6D

LOS ANGELES
Community Metabolism of Adenylates by Microheterotrophs from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03301 5B

Composting Results in Los Angeles,
W82-03400 5E

LOS ANGELES HARBOR
Orthophosphate Uptake by Phytoplankton and Bacterioplankton from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03172 5B

MADRID BASIN AQUIFER
The Madrid Basin Aquifer: Preliminary Isotopic Reconnaissance,
W82-03059 2F

MANAGEMENT PLANNING
On Water Availability and Demand in Nigeria,
W82-03062 6D

Energy Minimization at Metro Denver Sewage District,
W82-03142 5D

Modern Management Techniques, Part II A: Case History of Production Improvement,
W82-03310 6A

Modern Management Techniques. Part I: Need for, and Importance of, Productivity Improvement,
W82-03311 6A

MANGANESE
Iron-Manganese Banding in Oneida Lake Ferromanganese Nodules,
W82-03342 2H

MANGROVE SWAMPS
Water Quality and Mangrove Ecosystem Dynamics,
W82-03003 5C

MANNINGS EQUATION
Communication on 'Variation of Manning's n Roughness Coefficient with Flow in Open River Channels'.
W82-03382 2E

MARINE FLORA
Study of the Experimental Contamination of the Marine Phanerogam Posidonia Oceanica (L.) Delile by Mercury Compounds I. Modalities of the Contamination by Mercury Chloride. (Etude De La Contamination Experimentale De La Phanerogame Marine Posidonia Oceanica (L.) Delile Par Les Composes Mercuri Ques: Partie I-Modalites De La Contamination Par Le Chlorure Mercurique,
W82-03312 5B

MARINE SEDIMENTS
Fossil Carbon in Coastal Sediments,
W82-03201 5A

Sephadex LH-20 Chromatography of Extracts of Marine Sediment and Biological Samples for the Isolation of Polynuclear Aromatic Hydrocarbons,
W82-03370 5A

MATERIALS ENGINEERING
Corrosion Roundtable--Opportunities/Pitfalls for New Materials,
W82-03373 8G

MATHEMATICAL MODELS
Experimental Studies of the Effects of Ephemeral Streamflow Depths on Infiltration,
W82-03013 2A

The Agricultural Impact of Water Quality Standards: A Mathematical Programming Approach,
W82-03014 5G

The Development of Water Quality Management Plans Using Data from Automatic Stormwater Monitoring Networks,
W82-03069 5G

BIEM Solutions to Combinations of Leaky, Layered, Confined, Unconfined, Nonisotropic Aquifers,
W82-03079 2F

Programming Manual for MOBED - An Unsteady, Nonuniform, Mobile Boundary Flow Model,
W82-03109 2E

Reliability Programing in Reservoir Management 1. Single Multipurpose Reservoir,
W82-03148 6A

Mathematical Modeling and Computer Simulation of Radioactive and Toxic Chemical Species Dispersion in Porous Media in the Vicinity of Uranium Recovery Operations,
W82-03392 5B

MATHEMATICAL STUDIES
Numerical Stability and Accuracy of Implicit Integration of Free Surface Groundwater Equations,
W82-03060 2F

Translatory Characteristics of the Muskingum Method of Flood Routing--Reply,
W82-03204 4A

First Order Analysis of Uncertainty in Numerical Models of Groundwater Flow. Part I. Mathematical Development,
W82-03329 2F

MEASUREMENT TECHNIQUES
Field Application of the Four-Electrode Technique for Determining Soil Solution Conductivity,
W82-03260 2G

MEASURING INSTRUMENTS
Large Rain Drops in the Bright Band,
W82-03065 7B

MEMBRANE FILTERS
Artificial Particulate Fouling of Hyperfiltration Membranes IV. Dynamic Protection from Fouling,
W82-03288 3A

MERCURY
Preconcentration of Inorganic Mercury with an Anion-Exchange Resin and Direct Reduction-Aeration Measurements by Cold-Vapour Atomic Absorption Spectrometry,
W82-03268 5A

Methylmercury Contamination of an Experimental Trophic Chain: Importance of the Primary Producer-Consumer System. (Contamination D'une Chaine Trophique Experimentale par le Methylmercure: Importance du Systeme 'Producteur-Consommateur Primaire'),
W82-03303 5C

Study of the Experimental Contamination of the Marine Phanerogam Posidonia Oceanica (L.) Delile by Mercury Compounds I. Modalities of the Contamination by Mercury Chloride. (Etude De La Contamination Experimentale De La Phanerogame Marine Posidonia Oceanica (L.) Delile Par Les Composes Mercuri Ques: Partie I-Modalites De La Contamination Par Le Chlorure Mercurique,
W82-03312 5B

MERRIMACK RIVER BASIN
Water Resources Appraisals for Hydroelectric Licensing; Merrimack River Basin; New Hampshire, Massachusetts,
W82-03041 6D

MERSEY ESTUARY
The Effect of Tidal Heights on the Distribution and Abundance of Coliform Bacteria in the Sediments of Two Sites in the Mersey Estuary,
W82-03180 2L

METAL-FINISHING WASTES
Assessment of Emerging Technologies for Metal Finishing Pollution Control: Three Case Studies,
W82-03001 5D

Treatment of Metal Finishing Wastes by Use of Ferrous Sulfide,
W82-03002 5D

METALS
Trace Analysis of Toxic Metals. I. Determination of Lead, Mercury, Cadmium and Thallium by Amperometric Titration,
W82-03236 5A

METEOROLOGY
Meteorology of Important Rainstorms in the Colorado River and Great Basin Drainages,
W82-03047 2B

METHANE
Carbon Isotope Fractionation During Microbial Methane Oxidation,
W82-03188 5A

Biogeochemical Cycling in an Organic-Rich Coastal Marine Basin - I. Methane Sediment-Water Exchange Processes,
W82-03308 2K

METHYLATION
Chemical Alkylation of Lead(II) Salts to Tetraalkyllead (IV) in Aqueous Solution,
W82-03171 5B

MEXICO
A Perspective Study of Droughts in Mexico,
W82-03358 2E

MICROBIAL DEGRADATION
Observation on the Occurrence of Microbial Agents Which Cause Lysis of Blue-Green Algae in Lake Kasumigaura,
W82-03177 2H

MICROBIOLOGICAL STUDIES
A Model River Test to Describe the Various Impacts of Chemical Substances on Microbial Biocommunities,
W82-03147 5C

RNA Synthesis as a Measure of Microbial Growth in Aquatic Environments. II. Field Applications,
W82-03191 5A

RNA Synthesis as a Measure of Microbial Growth in Aquatic Environments. I. Evaluation, Verification and Optimization of Methods,
W82-03192 5A

Improved Microbe Detection in Water Samples.
W82-03258 5A

MICROCOSMS
Microcosms as Test Systems for the Ecological Effects of Toxic Substances: An Appraisal with Cadmium,
W82-03026 5C

MICROORGANISMS
Improved Microbe Detection in Water Samples.
W82-03258 5A

Microbial Activity of Trench Leachates from Shallow-Land, Low-Level Radioactive Waste Disposal Sites,
W82-03261 5B

MIGRATION
Vertical Migration and Mortality of Benthos in Dredged Material. Part I: Mollusca,
W82-03317 6G

MINE WASTES
Fine Coal-Refuse Slurry Dewatering,
W82-03049 5D

MINING ENGINEERING
Mathematical Modeling and Computer Simulation of Radioactive and Toxic Chemical Species Dispersion in Porous Media in the Vicinity of Uranium Recovery Operations,
W82-03392 5B

MODEL STUDIES
Water Quality and Mangrove Ecosystem Dynamics,
W82-03003 5C

A 'Random Walk' Solute Transport Model for Selected Groundwater Quality Evaluations,
W82-03007 6A

Alternative Costs and Total Economic Benefits: An Input-Output Study of the Aswan Dam (Egypt),
W82-03009 6B

Experimental Studies of the Effects of Ephemeral Streamflow Depths on Infiltration,
W82-03013 2A

Forecasting Subsurface Water Flow and Storage on Forested Slopes Using a Finite-Element Model,
W82-03018 2G

The Influence of Hydrodynamic Transport on Phytoplankton Dynamics in Homogeneous Lakes,
W82-03023 2H

Combined Sewer Overflow Abatement Program, Rochester, N.Y. - Volume I. Abatement Analysis,
W82-03035 5G

The Input-Output Water Transactions Model of Supply and Demand,
W82-03055 6D

The Madrid Basin Aquifer: Preliminary Isotopic Reconnaissance,
W82-03059 2F

Models of Water Transport in the Soil-Plant System: A Review,
W82-03066 2I

Estimating the Costs in Lost Power of Alternative Snake-Columbia Basin Management Policies,
W82-03073 6B

Worth of Short-Term Rainfall Forecasting for Combined Sewer Overflow Control,
W82-03075 2A

A Model of Discontinuous Measurement Error and Its Effects on the Probability Distribution of Flood Discharge Measurements,
W82-03076 2E

Modeling Double Aquifer Flow Using a Comprehensive Potential and Distributed Singularities 1. Solution for Homogeneous Permeability,
W82-03078 2F

Nodal Domain Integration Model of Unsaturated Two-Dimensional Soil-Water Flow: Development,
W82-03080 6A

Transport of Ion-Exchanging Solutes in Groundwater: Chromatographic Theory and Field Simulation,
W82-03082 5B

On the Computation of Darcian Velocity and Mass Balance in the Finite Element Modeling of Groundwater Flow,
W82-03083 2F

Modeling Double Aquifer Flow Using a Comprehensive Potential and Distributed Singularities 2. Solution for Inhomogeneous Permeabilities,
W82-03084 2F

A Planning Method for Evaluating Downstream Effects of Detention Basins,
W82-03089 4A

Lake Deoxygenation After Herbicide Use: A Simulation Model Analysis,
W82-03113 5C

Evaluation of Temperature Effects in Aerated Biotreaters,
W82-03140 5D

A Model River Test to Describe the Various Impacts of Chemical Substances on Microbial Biocommunities,
W82-03147 5C

Theory of the Dielectric Constant of Ice,
W82-03176 2C

An Ion-Association Model for Estimating Acidity Constants (At 25 C and 1 ATM Pressure) in Electrolyte Mixtures Related to Seawater (Ionic Strength < 1 MOL/KG H20),
W82-03194 1B

Some Basic Experiments with a Vertically-Integrated Ice Sheet Model,
W82-03209 2C

The Linear Decision Rule (LDR) Reservoir Problem with Correlated Inflows. I. Model Development,
W82-03237 4A

Sizing of Urban Flood Control Ponds,
W82-03297 2A

Completion of the List of Analytical Solutions for Nutrient Transport to Roots 1. Exact Linear Models,
W82-03327 5E

First Order Analysis of Uncertainty in Numerical Models of Groundwater Flow. Part I. Mathematical Development,
W82-03329 2F

Bacterial Utilization of Algal Extracellular Products. I. The Kinetic Approach,
W82-03330 5C

MOISTURE AVAILABILITY
Seminal Root Morphology and Water Use of Wheat. I. Environmental Effects,
W82-03307 2I

MOISTURE CONTENT
Ponded Infiltration into Simple Soil Systems: 1. The Saturation and Transition Zones in the Moisture Content Profiles,
W82-03323 2G

MOISTURE STRESS
Response of Sorghum to Moisture Stress Using Line Source Sprinkler Irrigation I. Plant-Water Relations,
W82-03265 2I

MOLLUSKS
Vertical Migration and Mortality of Benthos in Dredged Material. Part I: Mollusca,
W82-03317 6G

MONITORING
Biological Monitoring Part VI - Future Needs,
W82-03230 5C

Ground Water Monitoring: Part II,
W82-03380 5B

Practical Techniques of River Monitoring and Pollution Forecasting, Part 1: Continuous Quality Monitoring and Data Acquisition,
W82-03390 5A

MOROCCO
Eutrophication of the Lake-Reservoir Sidi Mohamed Ben Abdellah, Rabat, Morocco (L'Eutrophisation du Lac-Reservoir Sidi Mohamed Ben Abdellah Pres de Rabat, Maroco),
W82-03118 2H

MORPHOLOGY
Soil Morphology and Preferential Flow Along Macropores,
W82-03175 2G

MORTALITY
Vertical Migration and Mortality of Benthos in Dredged Material. Part I: Mollusca,
W82-03317 6G

MOUNTAIN LAKES
Contribution to High Altitude Limnology of the Himalayan System I. Limnology and Primary Productivity of the Plankton Community of Nilnag Lake, Kashmir,
W82-03314 2H

MOUNTAINS
Sessile Algae in European Mountain Streams. I. The Ecological Characteristics of Communities,
W82-03309 5C

MULTIOBJECTIVE PLANNING
Regional Multiobjective Planning of Water Supply and the Disposal of Residuals with Due Regard to Intraregional Population Distribution,
W82-03210 6A

MUNICIPAL WASTEWATER
Municipal Sewage: Three Communities Try to Cope,
W82-03284 5D

NATURAL WATERS
The Structure of Freshwater Humic Substances as Revealed by 13C-NMR Spectroscopy,
W82-03095 2H

NEBRASKA
Eutrophication of the Salt Valley Reservoirs, 1968-1973. II. Changes in Physical and Chemical Parameters of Eutrophication,
W82-03214 5C

NEMATODES
Distribution of Anoplostoma Viviparum (Nematoda) in Southampton Water Sediments,
W82-03343 2L

NEW ENGLAND
Report of Committee on Conservation, Development and Utilization of Water Resources.
W82-03374 3D

NEW HAMPSHIRE
Chemical Flux in an Acid-Stressed Stream,
W82-03338 5C

NEW JERSEY
Jersey Drought Hastens Water Supply Project,
W82-03385 6D

NEW ZEALAND
Mechanisms of Rapid Photosynthetic Adaptation in Natural Photoplankton Communities. II. Changes in Photochemical Capacity as Measured by DCMU-Induced Chlorophyll Fluorescence,
W82-03244 2H

NICKEL
The Effect of Ni(II) on Nitrification in the Activated Sludge Process,
W82-03124 5D

NIGERIA
On Water Availability and Demand in Nigeria,
W82-03062 6D

NILNAG LAKE
Contribution to High Altitude Limnology of the Himalayan System I. Limnology and Primary Productivity of the Plankton Community of Nilnag Lake, Kashmir,
W82-03314 2H

NITRIFICATION
The Effect of Ni(II) on Nitrification in the Activated Sludge Process,
W82-03124 5D

Nitrification Using the Rotating Biological Contactor,
W82-03132 5D

Factors Influencing Biological Nitrification of Steel Industry Wastewaters,
W82-03134 5D

Troubleshooting and Control of Nitrification Wastewater Treatment Systems,
W82-03135 5D

Improved Performance in Combined Nitrification/Denitrification of Tannery Waste,
W82-03277 5D

NITRITES
Extraction-Spectrophotometric Determination of Sub-Microgram Amounts of Nitrite Using 4-Nitroaniline and Naphth-1-Ol,
W82-03123 5A

NITROGEN
Sand-Filter Trenches for Purification of Septic Tank Effluent: II. The Fate of Nitrogen,
W82-03239 5D

Modeling Nitrogen Transport and Transformations in Soils: 1. Theoretical Considerations,
W82-03324 2G

NITROGEN REMOVAL
Biological Nitrogen Removal System Design,
W82-03145 5D

Improved Performance in Combined Nitrification/Denitrification of Tannery Waste,
W82-03277 5D

NONPOINT POLLUTION SOURCES
The Development of Water Quality Management Plans Using Data from Automatic Stormwater Monitoring Networks,
W82-03069 5G

NONSTRUCTURAL ALTERNATIVES
Combined Sewer Overflow Abatement Program, Rochester, N.Y. - Volume I. Abatement Analysis,
W82-03035 5G

NORTH FORK PAYETTE RIVER PROJECT
Final Environmental Impact Statement; North Fork Payette River Project FERC No. 2930-IDAHO.
W82-03046 6G

NORWAY
Sand-Filter Trenches for Purification of Septic Tank Effluent: I. Clogging Mechanism and Soil Physical Environment,
W82-03238 5D

Sand-Filter Trenches for Purification of Septic Tank Effluent: II. The Fate of Nitrogen,
W82-03239 5D

Bacterial Utilization of Algal Extracellular Products. 2. A Kinetic Study of Natural Populations,
W82-03331 5C

Acid Precipitation--A New Study from Norway,
W82-03341 5C

Acidification in 50 Norwegian Lakes,
W82-03344 2H

NOVA SCOTIA
Molecular Diffusion and the Sedimentary Environment: Results from the In Situ Determination of Whole Sediment Diffusion Coefficients,
W82-03091 2J

NUCLEAR MAGNETIC RESONANCE
The Structure of Freshwater Humic Substances as Revealed by 13C-NMR Spectroscopy,
W82-03095 2H

NUCLEAR POWERPLANTS
Reactor-Released Radionuclides in Susquehanna River Sediments,
W82-03189 5B

241Am from the Decay of 241Pu in the Irish Sea,
W82-03199 5B

NUMERICAL ANALYSIS
A Numerical Method for the Calculation of the Average Drawdown in a Fully Penetrating Observation Well in an Unconfined Aquifer,
W82-03061 2F

NUREK HYDROELECTRIC PLANT
New Technical Solutions Used for Concreting Tunnels of the Nurek Hydroelectric Plant,
W82-03150 8F

NUTRIENT
Preliminary Pollution Surveys Around the South-Western Cape Coast. Part 4: Salt River Mouth, Table Bay,
W82-03367 5B

NUTRIENT TRANSPORT
Completion of the List of Analytical Solutions for Nutrient Transport to Roots 1. Exact Linear Models,
W82-03327 5E

NUTRIENTS
The Canada Water Act, Annual Report 1980-1981.
W82-03098 7C

Full-Scale Evaluation of High Rate Screening Devices for Treatment of Sanitary Sewage By-Pass Flow,
W82-03110 5D

Eutrophication of the Lake-Reservoir Sidi Mohamed Ben Abdellah, Rabat, Morocco (L'Eutrophisation du Lac-Reservoir Sidi Mohamed Ben Abdellah Pres de Rabat, Maroco),
W82-03118 2H

Salinity and Biogenic Material in the North Caspian,
W82-03155 4A

Phosphorus and Nitrogen Budgets of Barton Broad and Predicted Effects of a Reduction in Nutrient Loading on Phytoplankton Biomass in Barton, Sutton and Stalham Broads, Norfolk, United Kingdom,
W82-03184 5C

Effects of Eutrophication on the Intertidal Ecology of Langstone Harbour, U.K. and Proposed Control Measures,
W82-03207 5C

Study on the Scarcity of Red Tide in the Eutrophicated Waters of Ariake Bay I. Dissolution of Phosphate Ion from Bottom Mud by Hydrogen Sulfide,
W82-03240 5C

Nitrogen and Phosphorus Nutrition of Cladophora in the Peel-Harvey Estuarine System, Western Australia,
W82-03398 2L

OBSERVATION WELLS
Ground Water Monitoring: Part II,
W82-03380 5B

OCCOQUAN WATERSHED
The Development of Water Quality Management Plans Using Data from Automatic Stormwater Monitoring Networks,
W82-03069 5G

OIL POLLUTION
Histopathological Changes in Two Estuarine Fishes Exposed to Crude Oil and Its Water-Soluble Fractions,
W82-03020 5C

OIL SEALANTS
Stopping Water with Chemical Grout,
W82-03396 8G

OIL SHALE
Will Synfuel Development Drain the West Dry,
W82-03292 6D

OIL SPILLS
Using Coherent Water Jets to Control Oil Spills,
W82-03031 5G

Removal of Oil Pollutants from Water Bodies by Means of Hydrophobic Sorbents,
W82-03371 5G

OLIGOTROPHIC LAKES
Phosphorus-Limited Growth of a Green Alga and a Blue-Green Alga,
W82-03120 2H

ONEIDA LAKE
Iron-Manganese Banding in Oneida Lake Ferromanganese Nodules,
W82-03342 2H

ONTARIO
Full-Scale Evaluation of High Rate Screening Devices for Treatment of Sanitary Sewage By-Pass Flow,
W82-03110 5D

Provision of Energy Requirements for Remote Communities by Small-Scale Hydro Development,
W82-03151 8A

OPEN-CHANNEL FLOW
Communication on 'Variation of Manning's n Roughness Coefficient with Flow in Open River Channels'.
W82-03382 2E

OPERATING COSTS
Operation Reports--City of Pueblo, Colorado Department of Public Works.
W82-03348 5D

OPIUM POPPY
Consumptive Water Use by Opium Poppy,
W82-03356 2I

ORGANIC COMPOUNDS
Treatability of Toxic Wastewater Pollutants by Solvent Extraction,
W82-03127 5D

Prediction of the Fate of Organic Compounds in Biological Wastewater Treatment Systems,
W82-03133 5D

Biogeochemical Cycling in an Organic-Rich Coastal Marine Basin - I. Methane Sediment-Water Exchange Processes,
W82-03308 2K

The Fate of Organic Micropollutants Through an Integrated Wastewater Treatment Water Reclamation System,
W82-03364 5D

ORGANIC LOADING
Inhibition of Nitrifying Activated Sludge Systems by Organic Shock Loads,
W82-03146 5D

ORGANIC MATTER
Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-IRI Bay of Lake Kasumigaura, Japan. V. Dynamics of Organic Debris,
W82-03231 2H

OUTFALL SEWERS
Note on Design of Diffusers for Sewage Outfalls Based on the Work of Rawn Et Al.,
W82-03347 5E

OVERFLOW
Hydraulic Model Studies of Theodore Roosevelt Dam - South Spillway,
W82-03051 8A

OXIDATION
Kinetics of Phenol Oxidation by Washed Cells,
W82-03399 5D

OXYGEN
Correlation of Oxygen 18 in Precipitation with Temperature and Altitude,
W82-03203 2A

The Ecology of a Land Drainage Channel--I. Oxygen Balance,
W82-03306 4A

OXYGEN DEPLETION
Lake Deoxygenation After Herbicide Use: A Simulation Model Analysis,
W82-03113 5C

OXYGENATION
Feasibility Study of Open Tank Oxygen Activated Sludge Wastewater Treatment,
W82-03032 5D

OZONATION
Virus Inactivation in Wastewater Effluents by Chlorine, Ozone, and Ultraviolet Light,
W82-03005 5D

Ozone for the Treatment of Hazardous Materials,
W82-03139 5D

OZONE
Assessment of Emerging Technologies for Metal Finishing Pollution Control: Three Case Studies,
W82-03001 5D

Inactivation of Enteroviruses by Ozone,
W82-03208 5F

PACIFIC NORTHWEST
Water Use Efficiency in Douglas Fir: The Nature of Plant Response to Selected Environmental Variables,
W82-03019 2I

PALO ALTO AREA
Simulation of the Transport of Ion-Exchanging Solutes Using Laboratory-Determined Chemical Parameter Values,
W82-03057 5B

PATH OF POLLUTANTS
Study of the Experimental Contamination of the Marine Phanerogam Posidonia Oceanica (L.) Delile by Mercury Compounds I. Modalities of the Contamination by Mercury Chloride. (Etude De La Contamination Experimentale De La Phanerogame Marine Posidonia Oceanica (L.) Delile Par Les Composes Mercuri Ques: Partie I-Modalites De La Contamination Par Le Chlorure Mercurique,
W82-03312 5B

Simulation of Flow Patterns and Ion-Exchange in Soil Percolation Experiments. Part II. Ion-Exchange Processes,
W82-03335 5B

Mathematical Modeling and Computer Simulation of Radioactive and Toxic Chemical Species Dispersion in Porous Media in the Vicinity of Uranium Recovery Operations,
W82-03392 5B

PATHOLOGY
Histopathological Changes in Two Estuarine Fishes Exposed to Crude Oil and Its Water-Soluble Fractions,
W82-03020 5C

PAYETTE RIVER BASIN
Water Resources Appraisal for Hydroelectric Licensing; Payette River Basin, Idaho.
W82-03043 6D

PEAK LOADS
Pumped-Storage Development in Brazil. Part III,
W82-03381 8A

PEE DEE RIVER BASIN
Water Resources Appraisals for Hydroelectric Licensing; Yadkin-Pee Dee River Basin; North Carolina, South Carolina, and Virginia,
W82-03042 6D

PEEL-HARVEY ESTUARY
Nitrogen and Phosphorus Nutrition of Cladophora in the Peel-Harvey Estuarine System, Western Australia,
W82-03398 2L

PERCOLATION
Simulation of Flow Patterns and Ion-Exchange in Soil Percolation Experiments. Part II. Ion-Exchange Processes,
W82-03335 5B

PERMEABILITY
A Numerical Method for the Calculation of the Average Drawdown in a Fully Penetrating Observation Well in an Unconfined Aquifer,
W82-03061 2F

Modeling Double Aquifer Flow Using a Comprehensive Potential and Distributed Singularities 1. Solution for Homogeneous Permeability,
W82-03078 2F

Modeling Double Aquifer Flow Using a Comprehensive Potential and Distributed Singularities 2. Solution for Inhomogeneous Permeabilities,
W82-03084 2F

A Problem Posed by Vapour-Dominated Geothermal Systems,
W82-03200 1A

PERMEABILITY COEFFICIENT
Soil Hydraulic Properties as Stochastic Processes: I. An Analysis of Field Spatial Variability,
W82-03315 2G

PERMITS
EPA Moving to Control Industrial Toxic Pollutants with New NPDES Permits,
W82-03296 6E

PESTICIDE RESIDUES
General Method for Determination of Pesticide Residues in Samples of Plant Origin, Soil, and Water. III. Gas Chromatographic Analysis and Confirmation,
W82-03215 5A

General Method for Determination of Pesticide Residues in Samples of Plant Origin, Soil, and Water. II. Thin Layer Chromatographic Determination,
W82-03216 5A

PHENOL
Use of a Fractional Design to Evaluate Interactions of Environmental Factors Affecting Biodegradation Rates,
W82-03117 5D

Kinetics of Phenol Oxidation by Washed Cells,
W82-03399 5D

PHILIPPINES
Demonstration of Anaerobic Biogas Digesters in Developing Countries. Part III: The Philippines,
W82-03226 5D

Zinc Deficiency in Wetland Rice Along a Toposequence of Hydromorphic Soils in the Philippines. I. Soil Conditions and Hydrology,
W82-03328 2G

PHOSPHORUS
Phosphorus-Limited Growth of a Green Alga and a Blue-Green Alga,
W82-03120 2H

The Phosphorus Cycle in Germinston Lake. 1. Investigational Objectives and Aspects of the Limnology of the Lake,
W82-03234 2H

PHOSPHORUS REMOVAL
Retrofit Conserves Energy at a Water Pollution Control Facility,
W82-03144 5D

PHOTOSYNTHESIS
Mechanisms of Rapid Photosynthetic Adaptation in Natural Photoplankton Communities. II. Changes in Photochemical Capacity as Measured by DCMU-Induced Chlorophyll Fluorescence,
W82-03244 2H

Patterns of Water Potential and Photosynthesis of Desert Sand Dune Plants, Eureka Valley, California,
W82-03271 2I

Physical Variability and Phytoplankton Communities: II. Primary Productivity by Phytoplankton in a Physically Variable Environment,
W82-03336 5C

PHYSICOCHEMICAL TREATMENT
Physical/Chemical Treatment of Coke Plant Wastewater,
W82-03033 5D

PHYSIOLOGICAL ECOLOGY
Sodium Regulation in the Tidepool Copepod Tigriopus Californicus,
W82-03262 5A

PHYTOPLANKTON
The Influence of Hydrodynamic Transport on Phytoplankton Dynamics in Homogeneous Lakes,
W82-03023 2H

Response of Phytoplankton to Acidification in Experimental Streams,
W82-03036 5C

Observations on a Gyrodinium Aureolum (Dinophyta) Bloom Off the South Coast of Ireland,
W82-03053 5C

Relationship Between Chlorophyll-a Concentration and Phytoplankton Biomass in Several Reservoirs in Czechoslovakia,
W82-03185 2H

The Composition and Ecology of Periphyton Communities in Freshwaters. II. Inter-Relationships Between Water Chemistry, Phytoplankton Populations and Periphyton Populations in a Shallow Lake and Associated Experimental Reservoirs ('Lund Tubes'),
W82-03217 2H

Limnologic Study of Lake Pavin (France) 1: Abiotic Factors and Phytoplankton (Contribution a L'etude Limnologique Du Lac Pavin (France) 1: Facteurs Abiotiques et Phytoplancton),
W82-03219 2H

Physical Variability and Phytoplankton Communities IV. Temporal Changes in the Phytoplankton Community of a Physically Variable Lake,
W82-03229 2H

Mechanisms of Rapid Photosynthetic Adaptation in Natural Photoplankton Communities. II. Changes in Photochemical Capacity as Measured by DCMU-Induced Chlorophyll Fluorescence,
W82-03244 2H

Physical Variability and Phytoplankton Communities: II. Primary Productivity by Phytoplankton in a Physically Variable Environment,
W82-03336 5C

PIGEON RIVER BASIN
Water Resources Appraisal for Hydroelectric Licensing; Pigeon River Basin; North Carolina, Tennessee,
W82-03039 6D

PINUS RADIATA
Evaporation from Vegetation in Landscapes Developing Secondary Salinity Using the Ventilated Chamber Technique, III. Evaporation from a Pinus Radiata Tree and the Surrounding Pasture in an Agroforestry Plantation,
W82-03213 2D

PIPELINES
Response of Buried Structures to Traveling Waves,
W82-03346 8D

Underground and Offshore: When to Consider Cathodic Protection,
W82-03349 8G

PLANKTON
Some Ecological Aspects of Lake Qarun, Fayoum, Egypt, Part II. Production of Plankton and Benthic Organisms,
W82-03052 2H

Orthophosphate Uptake by Phytoplankton and Bacterioplankton from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03172 5B

Community Metabolism of Adenylates by Microheterotrophs from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03301 5B

PLANNING
The Computer: Water Management Tool,
W82-03290 6A

Water: Too Much, Too Little, Too Bad,
W82-03291 6D

PLANT PHYSIOLOGY
Structure and Function of Mycorrhizal Rhizomorphs with Special Reference to Their Role in Water Transport,
W82-03190 2I

PLANT WATER POTENTIAL
Patterns of Water Potential and Photosynthesis of Desert Sand Dune Plants, Eureka Valley, California,
W82-03271 2I

POLICY MAKING
New Thrust in the 1980s for U.S. Water-Quality Programs,
W82-03252 5G

POLLUTANT IDENTIFICATION
Water Quality Analyses of the Colorado River Corridor of Grand Canyon,
W82-03017 5A

Extraction-Spectrophotometric Determination of Sub-Microgram Amounts of Nitrite Using 4-Nitroaniline and Naphth-1-Ol,
W82-03123 5A

Fossil Carbon in Coastal Sediments,
W82-03201 5A

General Method for Determination of Pesticide Residues in Samples of Plant Origin, Soil, and Water. II. Thin Layer Chromatographic Determination,
W82-03216 5A

Trace Analysis of Toxic Metals. I. Determination of Lead, Mercury, Cadmium and Thallium by Amperometric Titration,
W82-03236 5A

Chelating Resin Catcher for Capture, Preconcentration and Determination of Toxic Metal Traces (Zn, Cd, Hg, Pb) in Waters (Capteur de Resine Chelatante Pour le Prelevement la Preconcentration et la Determination de Metaux Traces Toxiques (Zn, Cd, Hg, Pb) dans les Eaux,
W82-03379 5A

POLYCHLORINATED BIPHENYLS
Survey of Polychlorinated Biphenyls in Industrial Effluents in Canada.
W82-03107 5A

Analytical Reference Materials. III. Preparation and Homogeneity Test of Large Quantities of Wet and Dry Sediment Reference Materials for Long Term Polychlorinated Biphenyl Quality Control Studies,
W82-03224 5A

PONDING
Ponded Infiltration Into Simple Soil Systems: 3. The Behavior of Infiltration Rate With Time,
W82-03366 2G

PONDS
Limnological Studies of a Freshwater Fish Pond at Burdwan, West Bengal, India,
W82-03186 2H

POPULATION DENSITY
Regional Multiobjective Planning of Water Supply and the Disposal of Residuals with Due Regard to Intraregional Population Distribution,
W82-03210 6A

POPULATION DYNAMICS
The Composition and Ecology of Periphyton Communities in Freshwaters. II. Inter-Relationships Between Water Chemistry, Phytoplankton Populations and Periphyton Populations in a Shallow Lake and Associated Experimental Reservoirs ('Lund Tubes'),
W82-03217 2H

PORES
Soil Morphology and Preferential Flow Along Macropores,
W82-03175 2G

POROUS MEDIA
Molecular Approach to the Foundations of the Theory of Solute Transport in Porous Media. I. Conservative Solutes in Homogeneous Isotropic Saturated Media,
W82-03316 2F

POTABLE WATER
Health Aspects of Water Desalination,
W82-03116 3A

New Techniques to Remove Radon from Ground Water.
W82-03157 5F

POTENTIAL WATER SUPPLY
Verification of the Potential Yield and Chemical Quality of the Shallow Dolomite Aquifer in Dupage County, Illinois,
W82-03100 2F

POWERPLANTS
Treatment of Cooling Tower Blowdown,
W82-03126 5D

The Structure of Benthic Communities in an Area of Thermal Discharge from a Coastal Power Station,
W82-03205 5C

PRECIPITATION
Correlation of Oxygen 18 in Precipitation with Temperature and Altitude,
W82-03203 2A

Acid Precipitation--A New Study from Norway,
W82-03341 5C

PREDICTION
Rainfall Prediction-Measurement Systems and Rainfall Design Information for Urban Areas,
W82-03008 7B

PRESSURE HEAD
Programmable Hand Calculator Programs for Pumping and Injection Wells: III. Constant Pumping (Injection) Rate, Fully Confined Aquifer, Partially Penetrating Well,
W82-03225 2F

PRESSURE MEASURING INSTRUMENTS
Continuous Discharge Measurement for the Transition Between Partly Filled and Pressurized Conduit Flow in Sewerage Systems,
W82-03152 7B

PRIMARY PRODUCTIVITY
Contribution to the Limnology of Lake Pavin (France) II. Relationships Between Nonbiological Parameters--Phyto and Zooplankton in the 0-20 Meter Zone (Contribution A L'Etude Limnologique du Lac Pavin (France). II. Relations Entre Parametres Abiotiques-Phyto et Zooplancton Dans la Zone 0-20 Metres),
W82-03178 2H

PROBABLE MAXIMUM PRECIPITATION
Meteorology of Important Rainstorms in the Colorado River and Great Basin Drainages,
W82-03047 2B

PRODUCTIVITY
Modern Management Techniques. Part I: Need for, and Importance of, Productivity Improvement,
W82-03311 6A

PROJECT PLANNING
Policies and Goals for California Water Management: The Next 20 Years.
W82-03111 6D

PROTECTION
Emergency Water Supply General Report No. 2, Concept for an Emergency Water Supply in Switzerland,
W82-03221 5F

Barrier Islands: Should Engineers Interfere with Nature,
W82-03377 6F

PROTOZOA
Detoxification of Zinc and Cadmium by the Freshwater Protozoan Tetrahymena Pyriformis. II. Growth Experiments and Ultrastructural Studies on Sequestration of Heavy Metals,
W82-03334 5G

PUBLIC HEALTH
Epidemiological Studies of Otitis Externa: Repot of a Prospective and of a Retrospective Study of Otitis Externa Among Swimmers,
W82-03027 5C

Health Aspects of Water Desalination,
W82-03116 3A

PUBLIC PARTICIPATION
River Clean-Up Plan Developed with Citizens and Industry,
W82-03283 5G

PUEBLO
Operation Reports--City of Pueblo, Colorado Department of Public Works.
W82-03348 5D

PUGET SOUND
Hydrocarbon Geochemistry of the Puget Sound Region-I. Sedimentary Acyclic Hydrocarbons,
W82-03241 5B

PUMPED STORAGE
TVA's Pumped-Storage Plant.
W82-03250 8A

Pumped-Storage Development in Brazil. Part III,
W82-03381 8A

PURE WATER
Complete Vitrification in Pure Liquid Water and Dilute Aqueous Solutions,
W82-03361 1A

QUEBEC
Susceptibility of Aquatic Ecosystems to the Effects of Atmospheric Pollutant Fallout in Quebec,
W82-03106 5C

RADAR
Evaluations of Illinois Weather Modification Projects of 1976-1980: A Summary,
W82-03006 3B

Rainfall Prediction-Measurement Systems and Rainfall Design Information for Urban Areas,
W82-03008 7B

Radar Measurements of Estuarine Currents and Tides,
W82-03360 2L

RADIATION
Reactor-Released Radionuclides in Susquehanna River Sediments,
W82-03189 5B

RADIOACTIVE WASTES
241Am from the Decay of 241Pu in the Irish Sea,
W82-03199 5B

Microbial Activity of Trench Leachates from Shallow-Land, Low-Level Radioactive Waste Disposal Sites,
W82-03261 5B

Alpha-Particle Radioactivity of Hot Particles from the Esk Estuary,
W82-03345 5A

Mathematical Modeling and Computer Simulation of Radioactive and Toxic Chemical Species Dispersion in Porous Media in the Vicinity of Uranium Recovery Operations,
W82-03392 5B

RADON REMOVAL
New Techniques to Remove Radon from Ground Water.
W82-03157 5F

RAIN-DROP SIZE ANALYSIS
Large Rain Drops in the Bright Band,
W82-03065 7B

RAIN GAGES
Rainfall Catch Errors Associated with Circumambient Obstructions,
W82-03021 2B

RAINFALL
Evaluations of Illinois Weather Modification Projects of 1976-1980: A Summary,
W82-03006 3B

Rainfall Prediction-Measurement Systems and Rainfall Design Information for Urban Areas,
W82-03008 7B

Rainfall Catch Errors Associated with Circumambient Obstructions,
W82-03021 2B

Will the Sahelian Drought End in 1985,
W82-03167 2B

Acid Precipitation in The Pittsburgh, Pennsylvania Area,
W82-03368 2B

RAINFALL DISTRIBUTION
Meteorology of Important Rainstorms in the Colorado River and Great Basin Drainages,
W82-03047 2B

RAINFALL FORECASTING
Worth of Short-Term Rainfall Forecasting for Combined Sewer Overflow Control,
W82-03075 2A

RAINSTORMS
Meteorology of Important Rainstorms in the Colorado River and Great Basin Drainages,
W82-03047 2B

RAJASTHAN
Quantification of Rainfall and Its Utilization Efficiency in Rajasthan,
W82-03276 2B

RAW WASTEWATER
Recovery of Indigenous Enteroviruses from Raw and Digested Sewage Sludges,
W82-03121 5D

RECLAIMED WATER
Water Cost Encourages Reuse and Conservation,
W82-03295 5D

RECREATION
Water Quality Analyses of the Colorado River Corridor of Grand Canyon,
W82-03017 5A

Final Environmental Impact Statement; North Fork Payette River Project FERC No. 2930-IDAHO.
W82-03046 6G

Don't Damn the Stanislaus,
W82-03275 6E

RECYCLING
Textile Warp Size Reclamation Using Thermal Precipitation,
W82-03034 5D

RED TIDE
Observations on a Gyrodinium Aureolum (Dinophyta) Bloom Off the South Coast of Ireland,
W82-03053 5C

Study on the Scarcity of Red Tide in the Eutrophicated Waters of Ariake Bay I. Dissolution of Phosphate Ion from Bottom Mud by Hydrogen Sulfide,
W82-03240 5C

REGIONAL PLANNING
Regional Multiobjective Planning of Water Supply and the Disposal of Residuals with Due Regard to Intraregional Population Distribution,
W82-03210 6A

Report of Committee on Conservation, Development and Utilization of Water Resources.
W82-03374 3D

Jersey Drought Hastens Water Supply Project,
W82-03385 6D

REGULATIONS
EPA's Approach to Regulating New Energy Technologies,
W82-03129 6E

REMOTE COMMUNITIES
Provision of Energy Requirements for Remote Communities by Small-Scale Hydro Development,
W82-03151 8A

REMOTE SENSING
Rainfall Prediction-Measurement Systems and Rainfall Design Information for Urban Areas,
W82-03008 7B

Remote Synoptic Surface Flow Measurements in Small Bodies of Water,
W82-03012 7B

An Aerial Technique for Assessing the Impact of Cooling Water Discharges on Receiving Water,
W82-03016 7B

Use of Environmental Satellite Data for Input to Energy Balance Snowmelt Models,
W82-03048 7B

Remote Sensing from Space-II.
W82-03248 7B

Remote Sensing Applications for Resource Management,
W82-03279 7B

Radar Measurements of Estuarine Currents and Tides,
W82-03360 2L

RESEARCH
Canada Water Year Book 1979-1980, Water Research Division.
W82-03096 7C

RESEARCH FACILITIES
ICI Brixham - Environmental Research in the Private Sector.
W82-03153 5D

RESEARCH PRIORITIES
Research Needs: Hydraulics, Coastal Engineering and Irrigation,
W82-03254 8A

RESERVOIR CONSTRUCTION
Reliability Programing in Reservoir Management 1. Single Multipurpose Reservoir,
W82-03148 6A

RESERVOIR OPERATION
Application of a Single Reservoir Operation Policy to a Rain Water Cistern System,
W82-03088 3B

Reliability Programing in Reservoir Management 1. Single Multipurpose Reservoir,
W82-03148 6A

Reliability Programming in Reservoir Management 2. Risk-Loss Functions,
W82-03245 6A

RESERVOIR RELEASES
The Linear Decision Rule (LDR) Reservoir Problem with Correlated Inflows. I. Model Development,
W82-03237 4A

RESERVOIR SILTING
A New Sediment Trap Efficiency Curve for Small Reservoirs,
W82-03086 8A

RESERVOIRS
Sediment Regulation Problems in Sanmenxia Reservoir,
W82-03072 2J

Increasing Hydrogen Ion Activity of Water in Two Reservoirs Supplying the San Francisco Bay Area, California,
W82-03081 5B

Eutrophication of the Lake-Reservoir Sidi Mohamed Ben Abdellah, Rabat, Morocco (L'Eutrophisation du Lac-Reservoir Sidi Mohamed Ben Abdellah Pres de Rabat, Maroco),
W82-03118 2H

Reliability Programing in Reservoir Management 1. Single Multipurpose Reservoir,
W82-03148 6A

Relationship Between Chlorophyll-a Concentration and Phytoplankton Biomass in Several Reservoirs in Czechoslovakia,
W82-03185 2H

Eutrophication of the Salt Valley Reservoirs, 1968-1973. II. Changes in Physical and Chemical Parameters of Eutrophication,
W82-03214 5C

Don't Damn the Stanislaus,
W82-03275 6E

RESINS
Corrosion Roundtable--Opportunities/Pitfalls for New Materials,
W82-03373 8G

RESOURCES MANAGEMENT
Policies and Goals for California Water Management: The Next 20 Years.
W82-03111 6D

RESPIRATION
Biological Nitrogen Removal System Design,
W82-03145 5D

REVERSE FILTERS
How About Reverse Filters,
W82-03247 4D

REVERSE OSMOSIS
Treatment of Cooling Tower Blowdown,
W82-03126 5D

RHINE RIVER
The River Rhine--Trans-National River Basin Management Developing Programme to Meet New Challenges,
W82-03372 5G

RHIZOSPHERE
Structure and Function of Mycorrhizal Rhizomorphs with Special Reference to Their Role in Water Transport,
W82-03190 2I

RICE
Zinc Deficiency in Wetland Rice Along a Toposequence of Hydromorphic Soils in the Philippines. I. Soil Conditions and Hydrology,
W82-03328 2G

RIPARIAN RIGHTS
The Evolution of Texas Water Law and the Impact of Adjudication,
W82-03085 6E

RISKS
Reliability Programming in Reservoir Management 2. Risk-Loss Functions,
W82-03245 6A

RIVER BASIN DEVELOPMENT
Water Resources Appraisal for Hydroelectric Licensing; Pigeon River Basin; North Carolina, Tennessee,
W82-03039 6D

Water Resources Appraisals for Hydroelectric Licensing; Cape Fear River Basin; North Carolina - South Carolina,
W82-03040 6D

Water Resources Appraisals for Hydroelectric Licensing; Merrimack River Basin; New Hampshire, Massachusetts,
W82-03041 6D

Water Resources Appraisals for Hydroelectric Licensing; Yadkin-Pee Dee River Basin; North Carolina, South Carolina, and Virginia,
W82-03042 6D

Water Resources Appraisal for Hydroelectric Licensing; Payette River Basin, Idaho.
W82-03043 6D

Water Resources Apparisals for Hydroelectric Licensing; St. Joseph - Kalamazoo River Basin; Indiana - Michigan,
W82-03044 6D

Water Resources Appraisal for Hydroelectric Licensing; Yampa River Basin; Colorado, Wyoming.
W82-03045 6D

RIVER BASINS
A Large International River: The Danube,
W82-03369 5G

RIVERS
Reactor-Released Radionuclides in Susquehanna River Sediments,
W82-03189 5B

Diversion of the River Neva,
W82-03304 4A

Ecological Effects of Mine Effluents on the South ESK River, North-Eastern Tasmania. I. Study Area and Basic Water Characteristics,
W82-03322 5C

ROCHESTER
Combined Sewer Overflow Abatement Program, Rochester, N.Y. - Volume I. Abatement Analysis,
W82-03035 5G

ROCKFILL DAMS
Cracking, Leakage, and Erosion of Earth Dam Materials,
W82-03149 8D

TVA's Pumped-Storage Plant.
W82-03250 8A

ROOT SYSTEMS
Completion of the List of Analytical Solutions for Nutrient Transport to Roots 1. Exact Linear Models,
W82-03327 5E

ROOT ZONE
Osmotic Potentials of Roots of Onions and Their Rhizospheric Soil Solutions when Irrigated with Saline Drainage Waters,
W82-03263 3C

ROTIFERS
Mass Production of Freshwater Rotifers on Liquid Wastes I. The Influence of Some Environmental Factors on Population Growth of Brachionus Rubens Ehrenberg 1838,
W82-03114 5D

ROUGHNESS COEFFICIENT
Communication on 'Variation of Manning's n Roughness Coefficient with Flow in Open River Channels'.
W82-03382 2E

Absolute Roughness of Concrete-Lined Channels,
W82-03397 8B

RURAL AREAS
Design and Fabrication of a Low Cost Package Water Treatment Plant for Rural Areas in India,
W82-03115 5F

SAHEL REGION
Will the Sahelian Drought End in 1985,
W82-03167 2B

SALINE-FRESHWATER INTERFACES
Studies on the Salinization of Coastal Ground Water. I. Confined Ground Water in the Naka River Estuary (In Japanese),
W82-03326 2L

SALINE LAKES
Effects of Dilution on the Benthos of an Alkaline Lake,
W82-03064 2H

SALINE SOILS
Solution of the Continuity Equation for the Karnak Area,
W82-03196 2G

SALINE WATER INTRUSION
Salt-Water Intrusion in a Layered Coastal Aquifer at York Point, Prince Edward Island,
W82-03108 2F

Graphs for Saline Wedges in Estuaries,
W82-03351 2L

SALINITY
Salt-Water Intrusion in a Layered Coastal Aquifer at York Point, Prince Edward Island,
W82-03108 2F

Parametric Model and Optimal Prediction of the Average Salinity of the Azov Sea,
W82-03154 5G

Salinity and Biogenic Material in the North Caspian,
W82-03155 4A

Diversion of the River Neva,
W82-03304 4A

The Measurement of Diffusion Coefficients in the Conwy Estuary,
W82-03388 2L

SALT BALANCE
Sodium Regulation in the Tidepool Copepod Tigriopus Californicus,
W82-03262 5A

SALT MARSHES
Diel Flux of Dissolved Carbohydrate in a Salt Marsh and a Simulated Estuarine Ecosystem,
W82-03168 2L

SALT RIVER
Preliminary Pollution Surveys Around the South-Western Cape Coast. Part 4: Salt River Mouth, Table Bay,
W82-03367 5B

SALT TOLERANCE
On the Dependence of Salt Tolerance of Beans (Phaseolus Vulgaris L.) on Soil Water Matric Potentials,
W82-03273 3C

SALT VALLEY
Eutrophication of the Salt Valley Reservoirs, 1968-1973. II. Changes in Physical and Chemical Parameters of Eutrophication,
W82-03214 5C

SALTS
Major Evaporite Deposition from Groundwater Remobilized Salts,
W82-03339 5B

Multimillion-Acre Tea Bag,
W82-03352 3F

SAMPLE PREPARATION
Analytical Reference Materials. III. Preparation and Homogeneity Test of Large Quantities of Wet and Dry Sediment Reference Materials for Long Term Polychlorinated Biphenyl Quality Control Studies,
W82-03224 5A

Preconcentration of Inorganic Mercury with an Anion-Exchange Resin and Direct Reduction-Aeration Measurements by Cold-Vapour Atomic Absorption Spectrometry,
W82-03268 5A

SAN FRANCISCO BAY AREA
Increasing Hydrogen Ion Activity of Water in Two Reservoirs Supplying the San Francisco Bay Area, California,
W82-03081 5B

SAND FILTERS
Sand-Filter Trenches for Purification of Septic Tank Effluent: I. Clogging Mechanism and Soil Physical Environment,
W82-03238 5D

Sand-Filter Trenches for Purification of Septic Tank Effluent: II. The Fate of Nitrogen,
W82-03239 5D

SANITARY LANDFILLS
A Finite Element Model for the Migration of Leachate from a Sanitary Landfill in Long Island, New York - Part II: Application,
W82-03220 5B

SANMENXIA RESERVOIR
Sediment Regulation Problems in Sanmenxia Reservoir,
W82-03072 2J

SATELLITE TECHNOLOGY
Use of Environmental Satellite Data for Input to Energy Balance Snowmelt Models,
W82-03048 7B

Remote Sensing from Space-II.
W82-03248 7B

Remote Sensing Applications for Resource Management,
W82-03279 7B

SAUDI ARABIA
Osmotic Potentials of Roots of Onions and Their Rhizospheric Soil Solutions when Irrigated with Saline Drainage Waters,
W82-03263 3C

SCALING
Precipitation Kinetics of Calcium Carbonate and Magnesium Hydroxide in a Scaling System,
W82-03136 2K

SCOTLAND
Airy Holm Dam - Kielder Water Scheme,
W82-03070 8A

SEAWATER
An Ion-Association Model for Estimating Acidity Constants (At 25 C and 1 ATM Pressure) in Electrolyte Mixtures Related to Seawater (Ionic Strength < 1 MOL/KG H20),
W82-03194 1B

Community Metabolism of Adenylates by Microheterotrophs from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03301 5B

Analysis of Trace Elements in Seawater. Part II. Determination of Heavy Metal Traces in Sea Water by X-Ray Fluorescence Analysis with Totally Reflecting Sample Holders,
W82-03333 5A

SEDIMENT TRANSPORT
Coping with Increased Stream Erosion in Urbanizing Areas,
W82-03067 2J

Programming Manual for MOBED - An Unsteady, Nonuniform, Mobile Boundary Flow Model,
W82-03109 2E

SEDIMENT-WATER INTERFACES
Biogeochemical Cycling in an Organic-Rich Coastal Marine Basin - I. Methane Sediment-Water Exchange Processes,
W82-03308 2K

SEDIMENTATION
Sediment Regulation Problems in Sanmenxia Reservoir,
W82-03072 2J

A New Sediment Trap Efficiency Curve for Small Reservoirs,
W82-03086 8A

Palaeoecological Studies of Lakes in the Highlands of Papua New Guinea. I. The Chronology of Sedimentation,
W82-03235 2J

Direct Influence of Wastewater Pollutants on Flocculation and Sedimentation Behavior in Biological Wastewater Treatment-I. Model System E. Coli B,
W82-03319 5D

SEDIMENTS
Molecular Diffusion and the Sedimentary Environment: Results from the In Situ Determination of Whole Sediment Diffusion Coefficients,
W82-03091 2J

Cadmium in Gammaridae (Amphipoda: Crustacea) of the Rivers Werra and Weser: Geographical Variation and Correlation to Cadmium in Sediments,
W82-03094 5B

Survey of Polychlorinated Biphenyls in Industrial Effluents in Canada.
W82-03107 5A

Hydrocarbon Geochemistry of the Puget Sound Region-I. Sedimentary Acyclic Hydrocarbons,
W82-03241 5B

Distribution of Anoplostoma Viviparum (Nematoda) in Southampton Water Sediments,
W82-03343 2L

Alpha-Particle Radioactivity of Hot Particles from the Esk Estuary,
W82-03345 5A

SEEDS
Possible Role of Abscisic Acid in Reducing Seed Set in Water-Stressed Wheat Plant,
W82-03197 2I

SEEPAGE
Evaluation of the Effectiveness and Reliability of Drains of the Tailrace of the Plyavinyas Hydroelectric Station,
W82-03161 8A

SEEPAGE CONTROL
A Suitable Lining Technique for Existing Distributaries,
W82-03063 8G

Earth-Filled Slurry Walls Provide Economical Seepage Control,
W82-03256 8D

Value Engineering Saves Dam Project,
W82-03287 8A

SEISMIC WAVES
Response of Buried Structures to Traveling Waves,
W82-03346 8D

SELENIUM
Report of the Aquatic Ecosystem Objectives Committee.
W82-03105 5G

SEMIARID CLIMATES
Dew Fall in the Dry Climatic Zones of India,
W82-03278 2B

SEPTIC TANKS
Septic Sewage Systems Contaminate Ground Water.
W82-03378 5B

SEPTIC WASTEWATER
Sand-Filter Trenches for Purification of Septic Tank Effluent: I. Clogging Mechanism and Soil Physical Environment,
W82-03238 5D

Sand-Filter Trenches for Purification of Septic Tank Effluent: II. The Fate of Nitrogen,
W82-03239 5D

SEWAGE
Full-Scale Evaluation of High Rate Screening Devices for Treatment of Sanitary Sewage By-Pass Flow,
W82-03110 5D

SEWAGE TREATMENT
The Tertiary Treatment of Sewages. Conclusion,
W82-03228 5D

SEWER HYDRAULICS
Continuous Discharge Measurement for the Transition Between Partly Filled and Pressurized Conduit Flow in Sewerage Systems,
W82-03152 7B

SEWER OVERFLOW CONTROL
Worth of Short-Term Rainfall Forecasting for Combined Sewer Overflow Control,
W82-03075 2A

SEWER SYSTEMS
Continuous Discharge Measurement for the Transition Between Partly Filled and Pressurized Conduit Flow in Sewerage Systems,
W82-03152 7B

Modern Management Techniques, Part II A: Case History of Production Improvement,
W82-03310 6A

SEWERS
Vacuum Sewers--The Future for Sewage Collection,
W82-03394 5G

SHOCK LOADS
Inhibition of Nitrifying Activated Sludge Systems by Organic Shock Loads,
W82-03146 5D

SILICA
A New Voltammetric Method for the Determination of Silica Traces in Water,
W82-03270 5A

SIMULATION ANALYSIS
Water Temperature Dynamics in Experimental Field Channels: Analysis and Modeling,
W82-03025 1A

Solution of the Continuity Equation for the Karnak Area,
W82-03196 2G

SLUDGE
Composting Results in Los Angeles,
W82-03400 5E

SLUDGE DIGESTION
Recovery of Indigenous Enteroviruses from Raw and Digested Sewage Sludges,
W82-03121 5D

Anaerobic Sludge Digestion--Need It Be Expensive,
W82-03389 5D

SLUDGE DISPOSAL
Sludge Management Process Integration,
W82-03130 5D

Entrenchment of Sewage Sludge--A Disposal-Use Alternative,
W82-03353 5E

Composting Results in Los Angeles,
W82-03400 5E

SLURRIES
Fine Coal-Refuse Slurry Dewatering,
W82-03049 5D

Earth-Filled Slurry Walls Provide Economical Seepage Control,
W82-03256 8D

SNAKE RIVER BASIN
Estimating the Costs in Lost Power of Alternative Snake-Columbia Basin Management Policies,
W82-03073 6B

SNOW COVER
Soil Filtration of Sewage Effluent of a Rural Area,
W82-03004 5D

SNOWMELT
Use of Environmental Satellite Data for Input to Energy Balance Snowmelt Models,
W82-03048 7B

SOCIAL IMPACT
The Gezira Scheme--A Study in Failure,
W82-03393 6B

SODIUM
Sodium Regulation in the Tidepool Copepod Tigriopus Californicus,
W82-03262 5A

SOIL MECHANICS
Calculation of Earth Dams Being Undermined,
W82-03162 8D

SOIL MOISTURE
Wheat Yield Estimation in Northwest Iran,
W82-03267 2I

Analysis of Longitudinal Dispersion in Unsaturated Flow I. The Analytical Method,
W82-03321 2G

SOIL PHYSICAL PROPERTIES
Method of Determining Mechanical Characteristics of Coarse Soils,
W82-03160 8D

SOIL PROFILES
Modeling Nitrogen Transport and Transformations in Soils: 1. Theoretical Considerations,
W82-03324 2G

SOIL PROPERTIES
Soil Hydraulic Properties as Stochastic Processes: I. An Analysis of Field Spatial Variability,
W82-03315 2G

SOIL SOLUTION
Field Application of the Four-Electrode Technique for Determining Soil Solution Conductivity,
W82-03260 2G

SOIL STRUCTURE
Soil Morphology and Preferential Flow Along Macropores,
W82-03175 2G

SOIL WATER
Nodal Domain Integration Model of Unsaturated Two-Dimensional Soil-Water Flow: Development,
W82-03080 6A

Soil Morphology and Preferential Flow Along Macropores,
W82-03175 2G

Soil Hydraulic Properties as Stochastic Processes: I. An Analysis of Field Spatial Variability,
W82-03315 2G

Ponded Infiltration into Simple Soil Systems: 1. The Saturation and Transition Zones in the Moisture Content Profiles,
W82-03323 2G

Modeling Nitrogen Transport and Transformations in Soils: 1. Theoretical Considerations,
W82-03324 2G

Performance of Different Crops with Residual Moisture in Vertisols,
W82-03357 2I

SOIL-WATER-PLANT RELATIONSHIP
Seminal Root Morphology and Water Use of Wheat. I. Environmental Effects,
W82-03307 2I

SOIL-WATER-PLANT RELATIONSHIPS
Models of Water Transport in the Soil-Plant System: A Review,
W82-03066 2I

Structure and Function of Mycorrhizal Rhizomorphs with Special Reference to Their Role in Water Transport,
W82-03190 2I

Evaporation from Vegetation in Landscapes Developing Secondary Salinity Using the Ventilated Chamber Technique, III. Evaporation from a Pinus Radiata Tree and the Surrounding Pasture in an Agroforestry Plantation,
W82-03213 2D

Response of Sorghum to Moisture Stress Using Line Source Sprinkler Irrigation I. Plant-Water Relations,
W82-03265 2I

The Influence of Plant Water Stress on Stomatal Control of Gas Exchange at Different Levels of Atmospheric Humidity,
W82-03272 2D

Completion of the List of Analytical Solutions for Nutrient Transport to Roots 1. Exact Linear Models,
W82-03327 5E

Zinc Deficiency in Wetland Rice Along a Toposequence of Hydromorphic Soils in the Philippines. I. Soil Conditions and Hydrology,
W82-03328 2G

SOILS
Ponded Infiltration Into Simple Soil Systems: 3. The Behavior of Infiltration Rate With Time,
W82-03366 2G

SOLAR ENERGY
Design and Economics of a Solar Heater Aquifer Storage System,
W82-03143 4B

SOLID WASTES
Duluth Sanitary District First in U.S. to Take Charge of Both Sewage and Refuse.
W82-03249 5E

SOLIDS CONTACT PROCESSES
Efficiencies of Advanced Waste Treatment Obtained with Upgraded Trickling Filters,
W82-03285 5D

SOLUBILITY COEFFICIENT
The Concentration and Isotopic Fractionation of Gases Dissolved in Freshwater in Equilibrium with the Atmosphere. 1. Oxygen,
W82-03325 1B

SOLUTE TRANSPORT
A 'Random Walk' Solute Transport Model for Selected Groundwater Quality Evaluations,
W82-03007 6A

Methods of Discharge Compensation as an Aid to the Evaluation of Water Quality Trends,
W82-03056 7B

Simulation of the Transport of Ion-Exchanging Solutes Using Laboratory-Determined Chemical Parameter Values,
W82-03057 5B

Transport of Ion-Exchanging Solutes in Groundwater: Chromatographic Theory and Field Simulation,
W82-03082 5B

Molecular Approach to the Foundations of the Theory of Solute Transport in Porous Media. I. Conservative Solutes in Homogeneous Isotropic Saturated Media,
W82-03316 2F

Analysis of Longitudinal Dispersion in Unsaturated Flow I. The Analytical Method,
W82-03321 2G

SOLUTES
Analysis of Longitudinal Dispersion in Unsaturated Flow I. The Analytical Method,
W82-03321 2G

SOLVENT EXTRACTION
Treatability of Toxic Wastewater Pollutants by Solvent Extraction,
W82-03127 5D

SORGHUM
Response of Sorghum to Moisture Stress Using Line Source Sprinkler Irrigation I. Plant-Water Relations,
W82-03265 2I

SORPTION
Removal of Oil Pollutants from Water Bodies by Means of Hydrophobic Sorbents,
W82-03371 5G

SOUTH AFRICA
The Phosphorus Cycle in Germinston Lake. 1. Investigational Objectives and Aspects of the Limnology of the Lake,
W82-03234 2H

The Fate of Organic Micropollutants Through an Integrated Wastewater Treatment Water Reclamation System,
W82-03364 5D

Preliminary Pollution Surveys Around the South-Western Cape Coast. Part 4: Salt River Mouth, Table Bay,
W82-03367 5B

Absolute Roughness of Concrete-Lined Channels,
W82-03397 8B

SOUTHERN HEMISPHERE
The Relationship Between Total Precipitable Water and Surface Dew Point,
W82-03257 2B

SPECIATION
Physiochemical Speciation of Lead in Drinking Water,
W82-03198 5F

Trace Metal Speciation in the Freshwater and Estuarine Regions of the Yarra River, Victoria,
W82-03387 5B

SPECIES COMPOSITION
Physical Variability and Phytoplankton Communities IV. Temporal Changes in the Phytoplankton Community of a Physically Variable Lake,
W82-03229 2H

SPECTROPHOTOMETRY
A Spectrophotometric Method for the Determination of Anionic Surfactants at Microg/Liter Levels,
W82-03289 5A

SPILLWAYS
Hydraulic Model Studies of Theodore Roosevelt Dam - South Spillway,
W82-03051 8A

The El Cajon Hydro Project in Honduras, Part Two,
W82-03332 8A

SPOIL BANKS
Vertical Migration and Mortality of Benthos in Dredged Material. Part I: Mollusca,
W82-03317 6G

SPRINKLER IRRIGATION
Soil Filtration of Sewage Effluent of a Rural Area,
W82-03004 5D

Design Procedure of Sprinkling Laterals: The Mathematical Background of a Computerized Aid,
W82-03174 3F

Response of Sorghum to Moisture Stress Using Line Source Sprinkler Irrigation I. Plant-Water Relations,
W82-03265 2I

ST. JOSEPH RIVER BASIN
Water Resources Apparisals for Hydroelectric Licensing; St. Joseph - Kalamazoo River Basin; Indiana - Michigan,
W82-03044 6D

ST. LAWRENCE ESTUARY
A Two-Dimensional Numerical Model of the Vertical Circulation of Tides in the St. Lawrence Estuary,
W82-03386 2L

STANISLAUS RIVER
Don't Damn the Stanislaus,
W82-03275 6E

STATISTICAL ANALYSIS
Reliability Programing in Reservoir Management 1. Single Multipurpose Reservoir,
W82-03148 6A

Reanalysis of 'Generalized Criteria for Seeding Winter Orographic Clouds',
W82-03173 3B

STATISTICAL MODELS
Analysis of Flow Through Heterogeneous Random Aquifers by the Method of Embedding Matrix. 1. Steady Flow,
W82-03320 2F

STEADY FLOW
Flow in Aquifers with Clay Laminae 2. Exact Solutions,
W82-03232 2F

Flow in Aquifers with Clay Laminae 1. The Comprehensive Potential,
W82-03242 2F

STEAM
A Problem Posed by Vapour-Dominated Geothermal Systems,
W82-03200 1A

STEAM STRIPPING
Laboratory Studies of Priority Pollutant Treatability,
W82-03030 5D

STEEL INDUSTRY
Factors Influencing Biological Nitrification of Steel Industry Wastewaters,
W82-03134 5D

Industrial Wastewater Audit,
W82-03337 5D

STOCHASTIC HYDROLOGY
Soil Hydraulic Properties as Stochastic Processes: I. An Analysis of Field Spatial Variability,
W82-03315 2G

STOCHASTIC PROCESSES
A Systems Model of Streamflow and Water Quality in the Bedford Ouse River System -- II. Water Quality Modelling,
W82-03243 5B

STOMATAL TRANSPIRATION
The Influence of Plant Water Stress on Stomatal Control of Gas Exchange at Different Levels of Atmospheric Humidity,
W82-03272 2D

STORAGE
Design and Economics of a Solar Heater Aquifer Storage System,
W82-03143 4B

STORAGE TANKS
Recent Water Towers in Norfolk,
W82-03246 8A

STORM-OVERFLOW SEWERS
Worth of Short-Term Rainfall Forecasting for Combined Sewer Overflow Control,
W82-03075 2A

STORM RUNOFF
A Planning Method for Evaluating Downstream Effects of Detention Basins,
W82-03089 4A

STORM SEWERS
Inflow Prediction and Cooperative Operation of Pumps, Valves and Gates in Storm Water Drainage System,
W82-03068 8C

STORM WATER
Better Ways to Finance Stormwater Management,
W82-03298 6C

STORMWATER
The Development of Water Quality Management Plans Using Data from Automatic Stormwater Monitoring Networks,
W82-03069 5G

STREAM DEGRADATION
Effects of Clearcutting and Slashburning on Stream Temperature in Southwestern British Columbia,
W82-03087 5C

Sessile Algae in European Mountain Streams. I. The Ecological Characteristics of Communities,
W82-03309 5C

STREAM EROSION
Coping with Increased Stream Erosion in Urbanizing Areas,
W82-03067 2J

STREAM POLLUTION
Response of Phytoplankton to Acidification in Experimental Streams,
W82-03036 5C

STREAMFLOW
Communication on 'Variation of Manning's n Roughness Coefficient with Flow in Open River Channels'.
W82-03382 2E

STREAMFLOW-WATER QUALITY RELATIONS
Methods of Discharge Compensation as an Aid to the Evaluation of Water Quality Trends,
W82-03056 7B

STREAMS
Chemical Flux in an Acid-Stressed Stream,
W82-03338 5C

STRESS ANALYSIS
Calculation of Earth Dams Being Undermined,
W82-03162 8D

SUBLETHAL EFFECTS
Histopathological Changes in Two Estuarine Fishes Exposed to Crude Oil and Its Water-Soluble Fractions,
W82-03020 5C

SUBSIDENCE
Calculation of Earth Dams Being Undermined,
W82-03162 8D

SUDAN
The Gezira Scheme--A Study in Failure,
W82-03393 6B

SULFATE REDUCTION
Dynamics of Bacterial Sulfate Reduction in a Eutrophic Lake,
W82-03119 2H

SULFATES
Molecular Diffusion and the Sedimentary Environment: Results from the In Situ Determination of Whole Sediment Diffusion Coefficients,
W82-03091 2J

Dynamics of Bacterial Sulfate Reduction in a Eutrophic Lake,
W82-03119 2H

SULFIDE PRECIPITATION
Treatment of Metal Finishing Wastes by Use of Ferrous Sulfide,
W82-03002 5D

SURFACE-GROUNDWATER RELATIONS
A 'Random Walk' Solute Transport Model for Selected Groundwater Quality Evaluations,
W82-03007 6A

SURFACE WATER
Remote Synoptic Surface Flow Measurements in Small Bodies of Water,
W82-03012 7B

SURFACTANTS
A Spectrophotometric Method for the Determination of Anionic Surfactants at Microg/Liter Levels,
W82-03289 5A

SUSPENDED SOLIDS
Removal of Heavy Metals and Suspended Solids from Battery Wastewaters: Application of Hydroperm Cross-Flow Microfiltration,
W82-03037 5D

Full-Scale Evaluation of High Rate Screening Devices for Treatment of Sanitary Sewage By-Pass Flow,
W82-03110 5D

The Effect of Suspended Materials on the Zooplankton, I. Natural Environments,
W82-03313 2H

SUSQUEHANNA RIVER
Reactor-Released Radionuclides in Susquehanna River Sediments,
W82-03189 5B

SWIMMING
Epidemiological Studies of Otitis Externa: Repot of a Prospective and of a Retrospective Study of Otitis Externa Among Swimmers,
W82-03027 5C

SWIMMING POOLS
Epidemiological Studies of Otitis Externa: Repot of a Prospective and of a Retrospective Study of Otitis Externa Among Swimmers,
W82-03027 5C

SWITZERLAND
Correlation of Oxygen 18 in Precipitation with Temperature and Altitude,
W82-03203 2A

Emergency Water Supply General Report No. 2, Concept for an Emergency Water Supply in Switzerland,
W82-03221 5F

SYNTHETIC FUELS
Will Synfuel Development Drain the West Dry,
W82-03292 6D

SYRIA
Cost-Benefit Analysis of the Euphrates Dam,
W82-03054 6B

SYSTEMS ANALYSIS
An Integrated Mesh-Nodal Method for Steady-State Water Distribution Network Analysis,
W82-03305 5F

TANNERY WASTES
Improved Performance in Combined Nitrification/Denitrification of Tannery Waste,
W82-03277 5D

TASMANIA
Ecological Effects of Mine Effluents on the South ESK River, North-Eastern Tasmania. I. Study Area and Basic Water Characteristics,
W82-03322 5C

TEMPERATURE
Correlation of Oxygen 18 in Precipitation with Temperature and Altitude,
W82-03203 2A

Physical Variability and Phytoplankton Communities: II. Primary Productivity by Phytoplankton in a Physically Variable Environment,
W82-03336 5C

TEMPERATURE EFFECTS
An Aerial Technique for Assessing the Impact of Cooling Water Discharges on Receiving Water,
W82-03016 7B

Evaluation of Temperature Effects in Aerated Biotreaters,
W82-03140 5D

TEMPORAL DISTRIBUTION
Physical Variability and Phytoplankton Communities IV. Temporal Changes in the Phytoplankton Community of a Physically Variable Lake,
W82-03229 2H

TENNESSEE VALLEY AUTHORITY
TVA's Pumped-Storage Plant.
W82-03250 8A

TERTIARY TREATMENT
The Tertiary Treatment of Sewages. Conclusion,
W82-03228 5D

TEXAS
The Evolution of Texas Water Law and the Impact of Adjudication,
W82-03085 6E

TEXTILE MILL WASTES
Textile Warp Size Reclamation Using Thermal Precipitation,
W82-03034 5D

THAILAND
Economic Appraisal of a Groundwater Development Project,
W82-03077 6B

THAMES WATER AUTHORITY
The Risk Business,
W82-03281 6E

THEODORE ROOSEVELT DAM
Hydraulic Model Studies of Theodore Roosevelt Dam - South Spillway,
W82-03051 8A

THERMAL POLLUTION
Cooling Water Discharge into Floodplain Meadows and Marshes: Effects, Mechanisms, and Implications for Environmental Analysis,
W82-03022 5C

Water Temperature Dynamics in Experimental Field Channels: Analysis and Modeling,
W82-03025 1A

The Structure of Benthic Communities in an Area of Thermal Discharge from a Coastal Power Station,
W82-03205 5C

Reciprocating Hail Processes in the Alps,
W82-03227 2B

THERMAL STRATIFICATION
Studies of the Hydrobiology of a Tropical Lake in Northwestern Queensland. II. Seasonal Changes in Thermal and Dissolved Oxygen Characteristics,
W82-03218 2H

THERMAL WATER
A Problem Posed by Vapour-Dominated Geothermal Systems,
W82-03200 1A

THERMOCLINE
Wake Collapse in The Thermocline and Internal Solitary Waves,
W82-03365 1A

THERMODYNAMICS
Water Temperature Dynamics in Experimental Field Channels: Analysis and Modeling,
W82-03025 1A

THIN LAYER CHROMATOGRAPHY
General Method for Determination of Pesticide Residues in Samples of Plant Origin, Soil, and Water. II. Thin Layer Chromatographic Determination,
W82-03216 5A

TIDAL EFFECTS
The Effect of Tidal Heights on the Distribution and Abundance of Coliform Bacteria in the Sediments of Two Sites in the Mersey Estuary,
W82-03180 2L

TIDES
Radar Measurements of Estuarine Currents and Tides,
W82-03360 2L

A Two-Dimensional Numerical Model of the Vertical Circulation of Tides in the St. Lawrence Estuary,
W82-03386 2L

TOKYO
Regional Multiobjective Planning of Water Supply and the Disposal of Residuals with Due Regard to Intraregional Population Distribution,
W82-03210 6A

TOXICITY
Microcosms as Test Systems for the Ecological Effects of Toxic Substances: An Appraisal with Cadmium,
W82-03026 5C

Toxic Substances Control Programs in the Great Lakes Basin.
W82-03103 5G

1981 Annual Report - Committee on the Assessment of Human Health Effects of Great Lakes Water Quality.
W82-03104 5A

Biological Monitoring Part VI - Future Needs,
W82-03230 5C

TOXINS
1981 Report on Great Lakes Water Quality, Appendix Great Lakes Surveillance.
W82-03101 5G

1981 Report on Great Lakes Water Quality.
W82-03102 5G

TRACE LEVELS
Extraction-Spectrophotometric Determination of Sub-Microgram Amounts of Nitrite Using 4-Nitroaniline and Naphth-1-Ol,
W82-03123 5A

TRACE METALS
Trace Metal Speciation in the Freshwater and Estuarine Regions of the Yarra River, Victoria,
W82-03387 5B

TRAP EFFICIENCY
A New Sediment Trap Efficiency Curve for Small Reservoirs,
W82-03086 8A

TREES
Water Use Efficiency in Douglas Fir: The Nature of Plant Response to Selected Environmental Variables,
W82-03019 2I

Evaporation from Vegetation in Landscapes Developing Secondary Salinity Using the Ventilated Chamber Technique, III. Evaporation from a Pinus Radiata Tree and the Surrounding Pasture in an Agroforestry Plantation,
W82-03213 2D

TRENCHES
Earth-Filled Slurry Walls Provide Economical Seepage Control,
W82-03256 8D

Entrenchment of Sewage Sludge--A Disposal-Use Alternative,
W82-03353 5E

TRICKLING FILTERS
Efficiencies of Advanced Waste Treatment Obtained with Upgraded Trickling Filters,
W82-03285 5D

TROPICAL CYCLONES
Meteorology of Important Rainstorms in the Colorado River and Great Basin Drainages,
W82-03047 2B

TROPICAL REGIONS
Studies of the Hydrobiology of a Tropical Lake in Northwestern Queensland. II. Seasonal Changes in Thermal and Dissolved Oxygen Characteristics,
W82-03218 2H

TUNNEL CONSTRUCTION
Grouting Works in the Diversion Tunnel of the Inguri Hydroelectric Station,
W82-03164 8A

Influence of Geology on Tunnelling Conditions and Deformational Behavior of Supports in Faulted Zones a Case History of the Chhobro-Khodri Tunnel in India,
W82-03181 8A

TUNNEL FAILURE
Influence of Geology on Tunnelling Conditions and Deformational Behavior of Supports in Faulted Zones a Case History of the Chhobro-Khodri Tunnel in India,
W82-03181 8A

TUNNEL LININGS
New Technical Solutions Used for Concreting Tunnels of the Nurek Hydroelectric Plant,
W82-03150 8F

Influence of Geology on Tunnelling Conditions and Deformational Behavior of Supports in

Faulted Zones a Case History of the Chhobro-Khodri Tunnel in India,
W82-03181 8A

TURBIDITY
The Effect of Suspended Materials on the Zooplankton, I. Natural Environments,
W82-03313 2H

TURBINES
Power Characteristic Curve of Hydraulic Turbine Set,
W82-03163 8B

ULTRAVIOLET RADIATION
Virus Inactivation in Wastewater Effluents by Chlorine, Ozone, and Ultraviolet Light,
W82-03005 5D

UNCONFINED AQUIFERS
A Numerical Method for the Calculation of the Average Drawdown in a Fully Penetrating Observation Well in an Unconfined Aquifer,
W82-03061 2F

UNDERGROUND STRUCTURES
New Technical Solutions Used for Concreting Tunnels of the Nurek Hydroelectric Plant,
W82-03150 8F

Response of Buried Structures to Traveling Waves,
W82-03346 8D

Underground and Offshore: When to Consider Cathodic Protection,

PLANO-EMPRESA DE PROJECTOS, LDA., LISBOA (PORTUGAL).
Type A Zeolite in the Activated Sludge Process--II: Heavy Metal Removal,
W82-03222 5D

PLANT PROTECTION AND AGROCHEMISTRY CENTRE, BUDAPEST (HUNGARY).
General Method for Determination of Pesticide Residues in Samples of Plant Origin, Soil, and Water. III. Gas Chromatographic Analysis and Confirmation,
W82-03215 5A

General Method for Determination of Pesticide Residues in Samples of Plant Origin, Soil, and Water. II. Thin Layer Chromatographic Determination,
W82-03216 5A

POLISH ACADEMY OF SCIENCES, KRAKOW. ZAKLAD BIOLOGII WOD.
Sessile Algae in European Mountain Streams. I. The Ecological Characteristics of Communities,
W82-03309 5C

The Effect of Suspended Materials on the Zooplankton, I. Natural Environments,
W82-03313 2H

PURDUE UNIV., LAFAYETTE, IN. DEPT. OF AGRONOMY.
Completion of the List of Analytical Solutions for Nutrient Transport to Roots 1. Exact Linear Models,
W82-03327 5E

PURDUE UNIV., LAFAYETTE, IN. SCHOOL OF CIVIL ENGINEERING.
Prediction of the Fate of Organic Compounds in Biological Wastewater Treatment Systems,
W82-03133 5D

QUEBEC UNIV., RIMOUSKI. DEPT. OF OCEANOGRAPHY.
A Two-Dimensional Numerical Model of the Vertical Circulation of Tides in the St. Lawrence Estuary,
W82-03386 2L

QUEEN ELIZABETH COLL., LONDON (ENGLAND). DEPT. OF BIOLOGY.
Detoxification of Zinc and Cadmium by the Freshwater Protozoan Tetrahymena Pyriformis. II. Growth Experiments and Ultrastructural Studies on Sequestration of Heavy Metals,
W82-03334 5G

RADIAN CORP., AUSTIN, TX.
Virus Inactivation in Wastewater Effluents by Chlorine, Ozone, and Ultraviolet Light,
W82-03005 5D

RAND AFRIKAANS UNIV., JOHANNESBURG (SOUTH AFRICA). RESEARCH GROUP FOR FRESHWATER BIOLOGY.
The Phosphorus Cycle in Germinston Lake. 1. Investigational Objectives and Aspects of the Limnology of the Lake,
W82-03234 2H

RAVISHANKAR UNIV., RAIPUR (INDIA). DEPT. OF CHEMISTRY.
Extraction-Spectrophotometric Determination of Sub-Microgram Amounts of Nitrite Using 4-Nitroaniline and Naphth-1-Ol,
W82-03123 5A

RENNES ECOLE NATIONALE SUPERIEURE DE CHIMIE (FRANCE).
Use of Adenosine Triphosphate in Biological Purification Systems (In French),
W82-03302 5D

RENSSELAER POLYTECHNIC INST. DEPT. OF CHEMICAL AND ENVIRONMENTAL ENGINEERING.
Artificial Particulate Fouling of Hyperfiltration Membranes IV. Dynamic Protection from Fouling,
W82-03288 3A

REXNORD, INC., MILWAUKEE, WI.
Two-Stage Biological Treatment of Coke Plant Wastewater,
W82-03029 5D

Physical/Chemical Treatment of Coke Plant Wastewater,
W82-03033 5D

RHODE ISLAND UNIV., KINGSTON. GRADUATE SCHOOL OF OCEANOGRAPHY.
Diel Flux of Dissolved Carbohydrate in a Salt Marsh and a Simulated Estuarine Ecosystem,
W82-03168 2L

ROME AIR DEVELOPMENT CENTER, HANSCOM AFB, MA. ELECTROMAGNETIC SCIENCES DIV.
Large Rain Drops in the Bright Band,
W82-03065 7B

ROSENSTIEL SCHOOL OF MARINE AND ATMOSPHERIC SCIENCE, MIAMI, FL.
Water Quality and Mangrove Ecosystem Dynamics,
W82-03003 5C

ROYAL NETHERLANDS METEOROLOGICAL INST. DE BILT.
Some Basic Experiments with a Vertically-Integrated Ice Sheet Model,
W82-03209 2C

RUTGERS - THE STATE UNIV., NEW BRUNSWICK, NJ.
An Economic Analysis of Water Conservation Policy,
W82-03090 6B

RUTGERS-THE STATE UNIV., NEW BRUNSWICK, NJ. WATER RESOURCES RESEARCH INST.
Coping with Increased Stream Erosion in Urbanizing Areas,
W82-03067 2J

SANDIA NATIONAL LABS., ALBUQUERQUE, NM.
Estimating the Costs in Lost Power of Alternative Snake-Columbia Basin Management Policies,
W82-03073 6B

SCIENCE AND EDUCATION ADMINISTRATION, BELTSVILLE, MD.
A New Sediment Trap Efficiency Curve for Small Reservoirs,
W82-03086 8A

SCIENCE AND EDUCATION ADMINISTRATION, FORT COLLINS, CO.
Lake Trophic State and Algal Growth as Influenced by Cation Concentrations,
W82-03038 5C

SCIENCE AND EDUCATION ADMINISTRATION, PHILADELPHIA, PA. EASTERN REGIONAL RESEARCH CENTER.
Improved Performance in Combined Nitrification/Denitrification of Tannery Waste,
W82-03277 5D

SCIENCE AND EDUCATION ADMINISTRATION, PHOENIX, AZ. CONSERVATION LAB.
Evaluation of Infiltration Measurements for Border Irrigation,
W82-03264 7B

SCIENCE AND EDUCATION ADMINISTRATION, PHOENIX, AZ. WATER CONSERVATION LAB.
Estimating Distribution Uniformity in Level Basins,
W82-03058 3F

SCIENCE AND EDUCATION ADMINISTRATION, WASHINGTON, DC.
Entrenchment of Sewage Sludge--A Disposal-Use Alternative,
W82-03353 5E

SCRIPPS INSTITUTION OF OCEANOGRAPHY, LA JOLLA, CA.
Remote Synoptic Surface Flow Measurements in Small Bodies of Water,
W82-03012 7B

SERVICE CONTROLE DE QUALITE DES EAUX, RABAT (MOROCCO).
Eutrophication of the Lake-Reservoir Sidi Mohamed Ben Abdellah, Rabat, Morocco (L'Eutrophisation du Lac-Reservoir Sidi Mohamed Ben Abdellah Pres de Rabat, Maroco),
W82-03118 2H

SEVERN TRENT WATER AUTHORITY (ENGLAND).
Anaerobic Sludge Digestion--Need It Be Expensive,
W82-03389 5D

SHEFFIELD UNIV. (ENGLAND). DEPT. OF BOTANY.
Structure and Function of Mycorrhizal Rhizomorphs with Special Reference to Their Role in Water Transport,
W82-03190 2I

SHINSHU UNIV., MATSUMOTO (JAPAN). DEPT. OF PUBLIC HEALTH.
Lemna (Duckweed) as an Indicator of Water Pollution. I. The Sensitivity of Lemna Paucicostata to Heavy Metals,
W82-03318 5A

SINGAPORE UNIV. DEPT. OF CHEMISTRY.
Trace Analysis of Toxic Metals. I. Determination of Lead, Mercury, Cadmium and Thallium by Amperometric Titration,
W82-03236 5A

SOCIETE LYONNAISE DES EAUX ET DE 1 ' ECLAIRAGE (FRANCE). LAB.
Eutrophication, Accelerated by Pollution,
W82-03193 5C

SOIL SURVEY INST., WAGENINGEN (NETHERLANDS).
Soil Morphology and Preferential Flow Along Macropores,
W82-03175 2G

SOUTH CAROLINA UNIV., COLUMBIA. DEPT. OF GEOLOGY.
Iron-Manganese Banding in Oneida Lake Ferromanganese Nodules,
W82-03342 2H

SOUTHAMPTON UNIV. (ENGLAND). DEPT. OF CHEMISTRY.
Theory of the Dielectric Constant of Ice,
W82-03176 2C

SOUTHAMPTON UNIV. (ENGLAND). DEPT. OF OCEANOGRAPHY.
Distribution of Anoplostoma Viviparum (Nematoda) in Southampton Water Sediments,
W82-03343 2L

SOUTHERN WATER AUTHORITY, WORTHING (ENGLAND).
Effects of Eutrophication on the Intertidal Ecology of Langstone Harbour, U.K. and Proposed Control Measures,
W82-03207 5C

STANFORD UNIV., CA.
Experimental Studies of the Effects of Ephemeral Streamflow Depths on Infiltration,
W82-03013 2A

STANFORD UNIV., CA. DEPT. OF CIVIL ENGINEERING.
Transport of Ion-Exchanging Solutes in Groundwater: Chromatographic Theory and Field Simulation,
W82-03082 5B

STATE UNIV. OF NEW YORK COLL. OF ENVIRONMENTAL SCIENCE AND FORESTRY, SYRACUSE.
An Aerial Technique for Assessing the Impact of Cooling Water Discharges on Receiving Water,
W82-03016 7B

STORMWATER CONSULTANTS, BOLINGBROOK, IL.
Better Ways to Finance Stormwater Management,
W82-03298 6C

SURREY UNIV., GUILDFORD (ENGLAND). DEPT. OF MICROBIOLOGY.
Recovery of Indigenous Enteroviruses from Raw and Digested Sewage Sludges,
W82-03121 5D

SVENSON AND ASSOCIATES, WATSONVILLE, CA.
Multimillion-Acre Tea Bag,
W82-03352 3F

SWEDISH INST. FOR SURFACE CHEMISTRY, STOCKHOLM.
Direct Influence of Wastewater Pollutants on Flocculation and Sedimentation Behavior in Biological Wastewater Treatment-I. Model System E. Coli B,
W82-03319 5D

SYDNEY UNIV. (AUSTRALIA). DEPT. OF INORGANIC CHEMISTRY.
A Spectrophotometric Method for the Determination of Anionic Surfactants at Microg/Liter Levels,
W82-03289 5A

SYDNEY UNIV. (AUSTRALIA). DEPT. OF SOIL SCIENCE.
Ponded Infiltration into Simple Soil Systems: 1. The Saturation and Transition Zones in the Moisture Content Profiles,
W82-03323 2G

Ponded Infiltration Into Simple Soil Systems: 3. The Behavior of Infiltration Rate With Time,
W82-03366 2G

TECHNICAL UNIV. OF DENMARK, COPENHAGEN. INST. OF HYDRODYNAMICS AND HYDRAULIC ENGINEERING.
Diversion of the River Neva,
W82-03304 4A

TECHNION - ISRAEL INST. OF TECH., HAIFA. DEPT. OF AGRICULTURAL ENGINEERING.
Design Procedure of Sprinkling Laterals: The Mathematical Background of a Computerized Aid,
W82-03174 3F

TECHNISCHE UNIV., BRUNSWICK (GERMANY, F.R.). LIECHTWEISS INST. FOR WATER RESEARCH.
Osmotic Potentials of Roots of Onions and Their Rhizospheric Soil Solutions when Irrigated with Saline Drainage Waters,
W82-03263 3C

TECHNISCHE UNIV., MUNICH (GERMANY, F.R.). INST. FUER HYDRAULIK UND GEWASSERKUNDE.
Continuous Discharge Measurement for the Transition Between Partly Filled and Pressurized Conduit Flow in Sewerage Systems,
W82-03152 7B

TEL-AVIV UNIV. (ISRAEL). SCHOOL OF ENGINEERING.
Analysis of Flow Through Heterogeneous Random Aquifers by the Method of Embedding Matrix. 1. Steady Flow,
W82-03320 2F

TENNESSEE UNIV., KNOXVILLE. DEPT. OF ENGINEERING SCIENCE AND MECHANICS.
Mathematical Modeling and Computer Simulation of Radioactive and Toxic Chemical Species Dispersion in Porous Media in the Vicinity of Uranium Recovery Operations,
W82-03392 5B

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF CHEMICAL ENGINEERING.
Design and Economics of a Solar Heater Aquifer Storage System,
W82-03143 4B

TEXAS TECH UNIV., LUBBOCK. DEPT. OF GEOGRAPHY.
The Evolution of Texas Water Law and the Impact of Adjudication,
W82-03085 6E

THAMES WATER AUTHORITY (ENGLAND).
The Risk Business,
W82-03281 6E

TORONTO UNIV. (ONTARIO). DEPT. OF CHEMISTRY.
Solution of the Continuity Equation for the Karnak Area,
W82-03196 2G

TOURS UNIV. (FRANCE). LAB. DE CHIMIE MINERALE ET D'HYDROLOGIE.
Chelating Resin Catcher for Capture, Preconcentration and Determination of Toxic Metal Traces (Zn, Cd, Hg, Pb) in Waters (Capteur de Resine Chelatante Pour le Prelevement la Preconcentration et la Determination de Metaux Traces Toxiques (Zn, Cd, Hg, Pb) dans les Eaux,
W82-03379 5A

TRONDHEIM UNIV. (NORWAY).
Cracking, Leakage, and Erosion of Earth Dam Materials,
W82-03149 8D

UNIVERSITY COLL., GALWAY (IRELAND). DEPT. OF OCEANOGRAPHY.
Observations on a Gyrodinium Aureolum (Dinophyta) Bloom Off the South Coast of Ireland,
W82-03053 5C

UNIVERSITY COLL. OF SWANSEA (WALES). DEPT. OF CHEMICAL ENGINEERING.
Kinetics of Phenol Oxidation by Washed Cells,
W82-03399 5D

UNIVERSITY OF EAST ANGLIA, NORWICH (ENGLAND). SCHOOL OF ENVIRONMENTAL SCIENCES.
Phosphorus and Nitrogen Budgets of Barton Broad and Predicted Effects of a Reduction in Nutrient Loading on Phytoplankton Biomass in Barton, Sutton and Stalham Broads, Norfolk, United Kingdom,
W82-03184 5C

UNIVERSITY OF EAST ANGLIA UNIV., NORWICH (ENGLAND). SCHOOL OF ENVIRONMENTAL SCIENCES.
The Composition and Ecology of Periphyton Communities in Freshwaters. II. Inter-Relationships Between Water Chemistry, Phytoplankton Populations and Periphyton Populations in a Shallow Lake and Associated Experimental Reservoirs ('Lund Tubes'),
W82-03217 2H

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES. DEPT. OF BIOLOGICAL SCIENCES.
Orthophosphate Uptake by Phytoplankton and Bacterioplankton from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03172 5B

Community Metabolism of Adenylates by Microheterotrophs from the Los Angeles Harbor and Southern California Coastal Waters,
W82-03301 5B

UNIVERSITY OF STRATHCLYDE, GLASGOW (SCOTLAND). DEPT. OF APPLIED GEOLOGY.
Fluoride Determination in Water: An Optimum Buffer System for Use with the Fluoride-Selective Electrode,
W82-03259 5F

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG (SOUTH AFRICA). HYDROLOGICAL RESEARCH UNIT.
Sizing of Urban Flood Control Ponds,
W82-03297 2A

UNIVERSITY OF WALES INST. OF SCIENCE AND TECHNOLOGY, CARDIFF. DEPT. OF APPLIED BIOLOGY.
The Ecology of a Land Drainage Channel--I. Oxygen Balance,
W82-03306 4A

UTAH UNIV., SALT LAKE CITY.
Biological Nitrogen Removal System Design,
W82-03145 5D

VELZY (CHARLES R.). ASSOCIATES, ARMONK, NY.
Retrofit Conserves Energy at a Water Pollution Control Facility,
W82-03144 5D

VICTORIA UNIV. OF MANCHESTER (ENGLAND). DEPT. OF CHILD DENTAL HEALTH.
Fluoride Determination in Water: An Optimum Buffer System for use with the Fluoride-Selective Electrode,
W82-03269 5A

VICTORIA UNIV. OF MANCHESTER (ENGLAND). POWER SYSTEMS LAB.
An Integrated Mesh-Nodal Method for Steady-State Water Distribution Network Analysis,
W82-03305 5F

VIRGINIA INST. AND STATE UNIV., BLACKSBURG. DEPT. OF BIOLOGY.
Biological Monitoring Part VI - Future Needs,
W82-03230 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF CIVIL ENGINEERING.
The Development of Water Quality Management Plans Using Data from Automatic Stormwater Monitoring Networks,
W82-03069 5G

The Effect of Ni(II) on Nitrification in the Activated Sludge Process,

SELECTED
WATER RESOURCES
ABSTRACTS

A monthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 15, NUMBER 8
AUGUST 1, 1982

W82-03401 -- W82-03750

MARCH 3, 1849

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a monthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and montlhy updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

1. NATURE OF WATER

1A. Properties

SURFACE VISCOSITY OF WATER,
Queen's Univ., Belfast (Northern Ireland). Dept. of Pure and Applied Physics.
J. C. Earnshaw.
Nature (London), Vol 292, No 5819, p 138-139, July 9, 1981. 2 Fig, 10 Ref.

Descriptors: *Viscosity, *Physical properties, *Interfaces, *Fluid mechanics, Air-water interfaces, *Surface tension, Mathematical equations, Capillary waves, Waves, Molecular structure.

Recent reports by Goodrich have shown that the molecularly diffuse region between two fluids displays anisotropic momentum transport parallel to and normal to the interface. This anisotropy leads to surface viscosity effects, two of which describe dilational viscosity within and normal to the interface and two describe shear viscosity. Earlier studies have shown that the propagation of capillary waves on the surface of water is not compatible with the predictions of accepted theory for a surface having no abnormal rheological properties. These apparent discrepancies can be resolved in terms of one of the surface shear viscosities predicted by Goodrich. The existence of such surface viscosities for pure water suggests that caution must be exercised in interpreting surface viscosities observed for surface films in terms of molecular structure of, or interactions within, the films. (Carroll-FRC)
W82-03501

FUNCTIONAL RELATIONS BETWEEN GENERAL CHARACTERISTICS OF ORGANIC MATTER IN NATURAL WATERS,
Akademiya Nauk SSSR, Moscow. Inst. Biologii Vnutrennykh Vod.
E. S. Bikbulatov.
Water Resources, Vol 8, No 1, p 53-61, January/February, 1981. 3 Tab, 22 Ref. Translated from Vodnye Resursy, No 1, p 117-127, January/February, 1981.

Descriptors: *Organic matter, *Oxidation, *Chemical oxygen demand, Biological oxygen demand, Oxygen equivalent, Humic acids, Thermodynamics, *Natural waters.

Some of the indices used to describe organic matter in natural waters are elemental and general biochemical composition, oxygen equivalent, ratios of different organic elements, degree of oxidation, stored energy, COD, and BOD. Equations are proposed to relate these known indices to each other. The relationship of average valence of C to oxygen equivalent is revealed. Three types of oxygen equivalent (two new) are established. Formulas are presented for calculating oxygen equivalent from biochemical and elemental analyses. Errors in previous investigations are pointed out and true values of oxygen equivalent given. Expressions are provided to describe energy storage of organic matter with respect to the easily determined parameters, bichromate oxidizability and organic nitrogen content. (Cassar-FRC)

THE CALCULATION OF ION PAIR DIFFUSION COEFFICIENTS: A COMMENT,
California Univ., Santa Barbara. Marine Science Inst.
K. S. Johnson.
Marine Chemistry, Vol 10, No 3, p 195-208, April, 1981. 1 Fig, 6 Tab, 37 Ref.

Descriptors: *Diffusion coefficients, *Ions, *Electrolytes, Salts, Seawater, Molecular diffusion, Mass transfer, Soil chemistry, Ion transport, Ion exchange.

The values of the diffusion coefficients of $MgSO_4$ ion pairs computed by Harned and Hudson (1951) and Katz and Ben-Yaakov (1980) are too high by a factor of two. The correct value of the ion pair diffusion coefficient at infinite dilution was obtained from the measured mutual diffusion coefficient after applying corrections for incomplete dissociation, the electrophoretic effect, the viscosity of the solution, and the effect of chloride ion pairs. Diffusion coefficients were calculated for the following (all values multiplied by 10 to the minus 5th power): $NaSO_4(-)$, 0.81; $CaCl(+)$, 0.78; $BaCl(+)$, 0.85; NaCl, 0.86; KCl, 1.09; NH_4Cl, 1.10, and CsCl, 1.27. Diffusion coefficients are generally less than those of the free ions. (Cassar-FRC)

COMPARISON OF FIVE DIFFERENT METHODS FOR MEASURING BIODEGRADABILITY IN AQUEOUS ENVIRONMENTS,
Battelle Columbus Div., OH.
J. L. Means, and S. J. Anderson.
Water, Air, and Soil Pollution, Vol 16, No 3, p 301-315, October, 1981. 5 Fig, 20 Ref.

Descriptors: *Biodegradation, *Organic compounds, Degradation, Ethylene glycol, Benzaldehyde, Aniline, Nitrilotriacetic acid, Nitrophenol, *Fate of pollutants, Biochemical tests, Microbial degradation, Biological oxygen demand, Shake flask test, Carbon dioxide evolution test, Gledhill test, Activated sludge test, Comparison studies, Technology, Analytical techniques.

Five methods for measuring biodegradability (BOD, Shake Flak, CO_2 Evolution, Activated Sludge, and Gedhill, which combines aspects of Shake Flask and CO_2 Evolution) were tested using aqueous solutions of aniline, benzaldehyde, ethylene glycol, nitrilotriacetic acid, and p-nitrophenol. The BOD test used concentrations of 1, 2, 4, 8, and 16 ppm; shake test, 20 ppm as organic carbon; CO_2 evolution, 10 ppm; activated sludge, 50 or 100 ppm as organic carbon; and Gledhill, 20 ppm as organic carbon. Aniline, benzaldehyde, and ethylene glycol degraded rapidly in all tests. Nitrilotriacetic acid was the slowest biodegrader, and p-nitrophenol was the second slowest. These two compounds behaved variably, according to the test used. Compounds which degrade in the activated sludge and Gledhill tests may not behave similarly in the natural environment. (Cassar-FRC)

WATER LOSS EQUATIONS AND COEFFICIENTS TO ESTIMATE RUNOFF FROM RAINFALL,
Macdonald Coll., Ste. Anne de Bellevue (Quebec). Dept. of Agricultural Engineering.
N. Foroud, and R. S. Broughton.
Water Resources Bulletin, Vol 17, No 3, p 387-393, June, 1981. 5 Fig, 4 Tab, 10 Ref.

Descriptors: *Infiltration, *Soil moisture, *Antecedent precipitation index, *Rainfall-runoff relationships, Model studies, Small watersheds, Watersheds, Storms, Excess rainfall.

A computer simulation model for flood runoff systems known as the FH-Model was used to analyze rainfall-runoff data from 39 storms on four small watersheds (17 to 342 sq km) in the Yamaska River Basin, Quebec. The loss parameters A (initial loss rate, cm per hour) and B (for a given soil and initial conditions, liters per hour) were obtained. These parameters were related to the antecedent precipitation index by equations. Using the data from 11 storms in a nearby watershed, the equations produced results in which seven points agreed within less than 10% and four points had errors of 10-40%. All these four storms occurred after a dry period in which soil moisture remained reasonably high. (Cassar-FRC)
W82-03441

RUNOFF PREDICTION AND RAINFALL UTILIZATION IN THE SEMI-ARID TROPICS,
Utah State Univ., Logan. Dept. of Engineering.
J. H. Krishna.
PhD Thesis, 1979. 160 p, 24 Fig, 9 Tab, 77 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-19256.

Descriptors: *Rainfall, *Runoff, *Prediction, Watersheds, *Model studies, Land management, Water management, Semiarid lands, Soil water, Tropical regions, Storm runoff, *Small watersheds, *India.

A parametric simulation model was developed to predict storm runoff volumes from small watersheds. It has minimal input data requirements which include daily rainfall amount, storm duration or rainfall intensity, and pan evaporation data. There are only two parameters (related to infiltration) which are determined through an optimization procedure during the calibration process. Hydrologic data was used from three small research watersheds with different land management treatments, located at ICRISAT, Hyderabad, India. A high degree of correlation was obtained between computed and measured runoff volumes in all cases. The model also simulated very well the variation in soil moisture during the test period. It was shown, by using data from another distantly located watershed that the parameter values for the model were transferable. When hydrologic data is not available for calibration purposes, initial estimates of the parameters can be made to provide preliminary runoff estimates even for a new location. The model was shown to be transferable not only to similar sites, but with proper judgment in selecting parameter values, to new locations as well. The water balance computations of the model were used to determine the effective rainfall under traditional and improved methods of land and water management for crop production in India. It was shown that effective rainfall could be increased three-fold by the adoption of improved land and water management technology. Actual yield data was used to show that significantly higher rainfall productivities than those at the present time, can be achieved. (Sinha-OEIS)

SIMULATION OF SOIL MOISTURE, EVAPOTRANSPIRATION AND DEEP PERCOLATION IN AGRICULTURAL WATERSHEDS,
Nebraska Univ., Lincoln.
M. Arbab.
PhD Thesis, December, 1980. 222 p, 51 Fig, 12 Tab, 93 Ref, 5 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-11673.

Descriptors: *Model studies, *Agricultural watersheds, Computer models, Groundwater recharge, Simulation analysis, *Percolation, *Soil water, *Evapotranspiration, Big Blue River basin, Nebraska.

The main objective of this study was to develop a set of mathematical relationships and formulate this into a digital computer model to simulate the surface hydrology of an agricultural watershed. The model was to be structured so that it could be applied to the irrigated or non-irrigated areas within any watershed with a minimum of modification and it was to be sufficiently flexible to be combined with a groundwater model to handle a case where the principal interest was either the surface water or groundwater. The model was to be tested by its application to continuous daily records from two weighing lysimeters for the surface hydrologic responses. It was also to be applied to an actual watershed where both surface water and groundwater factors are important and interdependent. The basin hydrology simulator de-

scribed in this study meets and satisfies those objectives. The developed model offers water resource managers a new tool for operational and management planning. One of the integral aspects was the history matching study of the Upper Big Blue River Basin in Nebraska. General conclusions drawn from the results of the application of the model to the Upper Big Blue River basin are: essentially all of the water percolating below the crop root zone in the area contributes to the groundwater system and can be considered as groundwater recharge; and the natural recharge to the groundwater mainly occurs under the irrigated lands and lands covered by native vegetations and pasture. In dry farmed areas, depletion of soil moisture from the crop root zone by evapotranspiration process provides sufficient storage for precipitation and consequently very little or no percolation occurs. (Sinha-OEIS)

W82-03523

CALIBRATING AND VERIFYING THE SSARR MODEL–MISSOURI RIVER WATERSHEDS STUDY,
Utah State Univ., Logan. Coll. of Natural Resources.
T. W. Canday, and K. N. Brooks.
Water Resources Bulletin, Vol 17, No 5, p 775-782, October, 1981. 4 Fig, 5 Tab, 14 Ref.

Descriptors: *Streamflow forecasting, *Runoff, Model studies, Calibrations, Model studies, *Hydrologic models, Streamflow Synthesis and Reservoir Regulation model, *Missouri River basin, Madison River, Gallatin River, Snowmelt, Watersheds, Reservoir operation.

The Streamflow Synthesis and Reservoir Regulation model (SSARR, U.S. Army Corps of Engineers, 1972) was calibrated and verified on two upper Missouri River watersheds, the Madison and the Gallatin. Model calibration was expedited by a procedure which used physical watershed characteristics and parameter sensitivity. Streamflow volumes from snowmelt were within 8% of observed volumes for both watersheds. Simulated volumes for verification years were within 15% in the Madison watershed and 12-28% in the Gallatin watershed. (Cassar-FRC)
W82-03549

DIVERGING OVERLAND FLOW,
Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
V. P. Singh, and N. Agiralioglu.
Advances in Water Resources, Vol 4, No 3, p 117-124, September, 1981. 7 Fig, 7 Ref.

Descriptors: *Mathematical models, *Overland flow, *Watersheds, *Rainfall-runoff relationships, *Kinematic wave theory, Hydrologic models, Mathematical equations, Rainfall, Spatial distribution, Model studies, Runoff, Hydrographs, Mathematical studies, Approximation methods, Mathematical analysis.

The diverging overland flow of a natural watershed was studied using kinematic wave theory approximations. The mathematical modeling of such a watershed has not been previously performed. The properties of some explicit analytical solutions derived in dimensionless form for constant lateral inflow were examined. These solutions gave good agreement with laboratory data reported in the literature for plane models. For time-variable rainfall, analytical solutions did not appear tractable. The present solutions may be extended, with only minor mathematical complexity, to include spatial variability of rainfall without changing the essential complexity, to include spatial variability of rainfall without changing the essential features. It was concluded that the kinematic wave approximation accurately describes diverging overland flow for most cases of hydrologic interest. (Geiger-FRC)
W82-03676

DAILY PARTITIONING OF RAINFALL TO SURFACE RUNOFF AND SOIL WATER ON COMPLEX LANDSCAPES,
Southern Piedmont Conservation Research Center, Watkinsville, GA.
A. W. Thomas, R. R. Bruce, and W. M. Snyder.
Transactions of the ASAE, VOL 24, No 5, p 1191-1198, September-October, 1981. 9 Fig, 4 Tab, 16 Ref.

Descriptors: *Rainfall-runoff relationships, *Model studies, Precipitation, Rainfall, Storms, Runoff, *Soil water, Infiltration, Seasonal variation, Watersheds, Climates, *Soil-water-plant relationships.

An approach was sought to incorporate complexities of soils, plants, and climate in order to partition rainfall satisfactorily for some problems. Specific objectives were to mathematically partition rainfall into runoff and soil water in a heterogeneous landscape and to assess the results by comparison with measurements of runoff and soil water over three years. A segment of the landscape in the upper plain of the Southern Piedmont physiographic region was selected for study. The primary surface and subsurface features contribute to the hydrology of the landscape in this area. To maintain a constant soil surface, soil erosion and sedimentation in the study area were minimized by a uniform, dense grass cover. Considerable variation in water partitioning and retention was expected over the area, due in part to past erosion patterns. A single partitioning device was used to predict both runoff and soil water, thus imposing integrity and consistency on the model. This device, known as the retention function, was driven by re-scaled pan evaporation between rain events. The model was used to simulate three years of measured surface runoff and soil-water data from the 1.3 ha watershed. The test period included above and below average rainfall years, wet and dry periods, judged in terms of the dual outputs and the pattern of simulated runoff and soil water rather than specific storms or short periods. Annual summaries and seasonal patterns of measured and predicted water quantities indicated that the model can partition rainfall into runoff and soil water. The model utilizing site characteristics of the heterogeneous land area computed dual outputs for a calendar year on the IBM 370/158+ in about 18 central processor unit seconds. (Baker-FRC)

SURFACE WATER AND GROUNDWATER INTERACTIONS IN A SURFICIAL AQUIFER IN NORTHWEST IOWA,
Iowa State Univ., Ames. Dept. of Civil Engineering.
H. Arfa.
PhD Thesis, 1980. 250 p, 36 Fig, 36 Tab, 123 Ref, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-19621.

Descriptors: Surface water, Surface runoff, Groundwater, *Mathematical models, Rainfall, *Groundwater recharge, Aquifers, Water requirements, *Surface-groundwater relations, *Iowa, Groundwater fluctuations, *Water level fluctuations.

The objective of this research is to evaluate a surficial aquifer and its interaction with surface runoff, with an objective of constructing a general mathematical model to respond to these interrelations. To evaluate the application of probabilistic laws to surficial groundwater fluctuations, a study of the sequential variation of rainfall in Northwest Iowa was conducted. Rainfall variations were defined, from dry-dry to wet-wet sequences. The interaction between surface water and surficial groundwater is a complicated phenomenon, and a strong tool is needed. The best tool for this situation, to be both practical and reliable, is the use of mathematical models. The basin selected for study is the Floyd River Basin, above Alton, which has the approximate geometry and dimensions of a unit model of interest. Full emphasis is put on recharge concepts of surficial groundwater in the basin, and the capability of the aquifer to withstand temporary mining or over-drafting to meet the beneficial water use requirements of the basin. The text of this dissertation includes the essential scientific theories and definitions, results obtained, and considers the practical laws of interactions with necessary discussion. (Sinha-OEIS)

RAINFALL INTERSTATION CORRELATION FUNCTIONS. II. APPLICATION TO THREE STORM MODELS WITH THE PERCENTAGE OF DRY DAYS AS A NEW PARAMETER,
Instituut voor Cultuurtechniek en Waterhuishouding, Wageningen (Netherlands).
P. T. Stol.
Journal of Hydrology, Vol 50, No 1-3, p 73-104, March, 1981. 7 Fig, 5 Tab, 16 Ref.

Descriptors: *Correlation functions, *Rainfall, *Gaging stations, Rain gages, Network design, Mathematical studies, Storms, Precipitation, Model studies.

A method was previously published for deriving rainfall interstation correlation functions from storm models. However, this method was incomplete in that dry days had to be skipped. In the present paper, a general formula is derived which has been extended with a parameter to account for the percentage of dry days that may occur in an area. The interstation correlation is a function of the interstation distance. The length and width of the storm are the parameters in the correlation function. The gaged area and the storm passing area must be well defined in order to obtain homogeneity with respect to statistical parameters. The storm model is the starting point in the actual procedure for deriving interstation correlation functions. Storm models suggested in the literature include rectangular, exponential and triangular models. The current analytical procedure was applied to these. The general patterns for the three storm models are similar. The rectangular model has lower correlation coefficients, especially when the fraction of dry days is small. Negative correlation occurs when the storm width has a small value. In practice it is difficult to distinguish between the three storm types. For large storm width values the correlation functions for the triangular and exponential storms are the same. (Cassar-FRC)

RAINFALL INTERSTATION CORRELATION FUNCTIONS. I. AN ANALYTIC APPROACH,
Instituut voor Cultuurtechniek en Waterhuishouding, Wageningen (Netherlands).
P. T. Stol.
Journal of Hydrology, Vol 50, No 1-3, p 45-71, March, 1981. 4 Fig, 5 Tab, 43 Ref.

Descriptors: *Correlation functions, *Rainfall, *Gaging stations, Rain gages, Network design, Mathematical studies, Storms, Precipitation, Model studies.

Correlations between rainfall amounts measured in gages at various interstation distances are analytically determined for a triangular storm model. Previously, functions describing the relationships between interstation correlation and interstation distance (known as correlation function) were determined empirically from the diagram of estimated correlation coefficients plotted against the corresponding interstation distances. Characteristics of storms and test areas are inserted as parameters. (Cassar-FRC)

COMPARISON OF RESULTS OBTAINED WITH THE VIDIAZ SPECTROPLUVIOMETER AND THE JOSS-WALDVOGEL RAINFALL DISDROMETER IN A 'RAIN OF A THUNDERY TYPE',

Institut et Observatoire de Physique, Clermont-Ferrand (France).
G. Donnadieu.
Journal of Applied Meteorology, Vol 19, No 5, p 593-597, May, 1980. 3 Fig, 1 Tab, 10 Ref.

Descriptors: *Rain, *Radar, *Distribution patterns, *Remote sensing, Velocity, Measuring instruments, Spectropluviometer, Disdrometer, Precipitation, Rainfall.

A photoelectric spectropluviometer VIDIAZ, which measures the diameter and fallspeed of each raindrop, was used to determine the mean values of the raindrop size distribution, rainfall rate, liquid water content, and radar reflectivity in thunderstorms. The results were compared with those obtained using a Joss-Waldvogel disdrometer, which gives the diameter by measurement of the force of the impacting drops on a sensor, assuming that they fall at the terminal velocities in still air obtained by Gunn and Kinzer. Fourteen measurements of 1 minute each were made in a rain of a thundery type. The fallspeeds of raindrops were found to be about 13 to 17 percent above the values of Gunn and Kinzer for raindrops with diameters measuring between 0.8 and 2.8 millimeters. This relatively small deviation produces a correction of 12 percent on the rainfall rate and of 17 percent for liquid water content and radar reflectivity for the Joss-Waldvogel disdrometer. Rainfall rate, liquid water content, and radar reflectivity were found to have a common range of values for the two instruments once these corrections for the disdrometer and a correction coming from raindrops unrecorded by the spectropluviometer were included and an allowance was made for the statistical errors resulting from the natural fluctuations of the rain. PROTON MOBILITY IN ICE,
Interuniversitair Reactor Inst., Delft (Netherlands).
M. Kunst, and J. M. Warman.
Nature (London), Vol 288, No 5790, p 465-467, December 4, 1980. 1 Fig, 35 Ref.

Descriptors: *Protons, *Ice, Physicochemical properties, Deuterium, Heavy water, Conductivity, Microwaves.

The vertical mobility of protons in H2O ice, determined by nanosecond pulse radiolysis microwave conductivity, was 0.0064 sq cm per volt per sec. Mobility of deuterons in D2O ice was 0.0024 sq cm per volt per sec at -5 C. Decreasing the temperature to -30 C doubled the values, corresponding to a negative activation energy of 0.15 eV. The narrow-band polaron theory predicts a sharp changeover to a thermally activated hopping motion at higher temperatures, with an activation energy which decreases with increasing temperature. At high enough temperatures, a maximum in mobility is predicted. This theory describes the data, with the main charge interaction apparently involving the 200 per cm 0-0 lattice vibration. Over a period of a few hundred nanoseconds the proton conductivity signal decays to 10-20% of the initial value. Temporary complexing of protons with L defects results in effective drift mobilities of 0.0008 and 0.0002 sq cm per volt per sec for H3O+ in H2O and D3O+ in D2O, respectively at -5 C. (Cassar-FRC)

RECRYSTALLISATION AND ELECTRICAL BEHAVIOUR OF GLACIER ICE,
British Antarctic Survey, Cambridge (England).
J. M. Reynolds, and J. G. Paren.
Nature, Vol 283, No 5742, p 63-64, January 3, 1980. 26 Ref.

Descriptors: *Resistivity, *Electrical properties, *Glaciers, Ice, Antarctic, Polar regions, Crystallization.

Previous studies have indicated that the electrical resistivity of ice from temperate glaciers, which is essentially at its pressure melting point, is about 1000 times greater than that of ice from polar regions, which is well below its pressure melting point. Recent studies have sought an explanation for this marked diversity in resistivity. The polar nature of Antarctic ice has been established by georesistivity measurements made on the George VI Ice Shelf, despite its saturation by melt-water from surface melt lakes. Although previous studies have suggested that different impurity concentrations may be responsible for the extremes in resistivity between temperate ice and polar ice, evidence from this study indicates that impurity levels are similar, in spite of the leaching of contaminants by free water in temperate glaciers. Such leaching activity is absent in true polar glaciers. Resistivity appears to be affected only indirectly by free water. The electrical behavior of high density ice formed on a cold glacier by compaction was found to be very similar to that of ice formed by the percolation and refreezing of melt water, implying that the electrical behavior of ice is completely stabilized within a few years after the ice forms. It is suggested that the complete removal of melt water runoff and the extent of recrystallization which occur in response to stress in temperate glaciers, but which are reduced or absent in polar ice masses, may be responsible for the differences in the electrical behaviors of these two ice forms. PARAMETRIC STUDY OF FLOOD WAVE PROPAGATION,
Indian Inst. of Science, Bangalore (India). Dept. of Civil Engineering.
K. Sridharan, and M. S. M. Kumar.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY9, p 1061-1076, September, 1981. 13 Fig, 14 Ref.

Descriptors: *Wave propagation, *Flood waves, *Channel flow, Kinematic waves, Subsidence, Open channel flow, Fluid mechanics, Hydraulics, Flow characteristics, Parametric hydrology, Discharge hydrographs, Froude number, Unsteady flow, Varied flow.

This paper presents a parametric study of flood wave propagation based on numerical solutions of the nondimensionalized unsteady flow equations. The properties of a sinusoidal flood wave in a prismatic channel were studied for uniform initial flow. The uniform flow Froude number, the wave parameters, and the channel shape parameters are varied over a wide range. Several conclusions were derived from this work. Significant subsidence occurs in prismatic open channels, particularly in the cases of narrow channels, smaller initial uniform flow Froude numbers, and inflow hydrographs with smaller wave duration. Lower initial uniform flow Froude numbers are associated with greater subsidence. Lower inflow wave amplitudes give slightly higher subsidence. Lower wave duration values produce significantly lower subsidence. Side slope does not significantly affect the rate of subsidence except in narrow channels. The nondimensional speed of the wave peak is independent of side slope, except in narrow channels. The width of the channel significantly affects subsidence, with the least effect in wide channels. Relative wave amplitude and relative discharge rise decrease exponentially with distance in the initial reaches. The speed of the wave peak and that of the corresponding kinematic wave agree. A model for predicting flood area for ultimate use in estimating the long-term losses that are incurred due to flooding treats the floodplain as a storage area for flows in excess of the channel capacity. The flood path is considered to follow a sequence of field inundations determined by topography termed the flood series. The movement of overspills through the flood series and the flood hydrographs having peaks in excess of bankfull discharge are used to estimate the overspill volume. The model was applied to a floodplain area of the River Nith of Southwest Scotland. Model accuracy was 85% for predicting flood area for a 50-year return interval flood. The advantages of using field units as proposed in the present model over channel extension modelling are discussed. More research into the patterns of return flows is needed to examine the duration of standing water or the distribution of floodwater over time following the passage of a hydrograph peak. HYDRAULIC EXPONENTS,
Illinois Univ. at Urbana-Champaign. Dept. of Civil and Hydrosystems Engineering.
V. T. Chow.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1489-1499, 1981. 2 Fig, 1 Tab, 11 Ref.

Descriptors: *Hydraulics, *Mathematical studies, Channels, Channel flow, *Open-channel flow, Flow, Flow discharge, *Flow profiles.

The significance of hydraulic exponents is in their application to the computation of flow profiles of a gradually varied flow in prismatic open channels, where their use will greatly simplify the otherwise complicated computation. This paper clarifies the mathematical derivation of the hydraulic exponents and their implication in application to the computation of flow profiles of gradually varied flow in a prismatic channel. The relationships between these hydraulic exponents, which are assumed to depend only on the average flow depth, and those which are assumed to vary with the flow depth of a given range are also explained. The use of the hydraulic exponents in a flow-profile computation involves an approximation, which is to use the values of these exponents at the average depth of the range of flow depth under consideration. This approximation greatly simplifies the computation by direct integration and has been proven to produce reliable results for practical purposes. The use of these hydraulic exponents would involve the variation of these values within the range of flow under consideration and would not therefore be useful to achieve simplification in a flow-profile computation by the method of direct integration. SAFE-YIELD ESTIMATES OF A WATER SUPPLY RESERVOIR ON AN UNGAGED STREAM,

Pennsylvania State Univ., University Park.
J. R. Ousey, Jr.
PhD Thesis, March, 1980. 95 p, 6 Fig, 11 Tab, 38 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-15826.

Descriptors: *Streamflow, *Drainage areas, Yield, Safe yield, Water supply, *Reservoir capacity, Hypsometric analysis, Saturated soils, *Low flow, Piedmont terrain, *Streamflow forecasting, Reservoir releases.

This investigation tested the usefulness of two basin parameters in predicting the low-flow streamflow characteristics of drainage basins in the metamorphic Piedmont terrain of southeastern Pennsylvania. The characterization of the low-flow regime developed from basin parameters was used in assessing the safe-yield potential of a water supply reservoir on an ungaged stream where a time-series analysis of collected flow data was not possible. The parameters chosen were the hypsometric integral and the saturated-soil cover of the selected basins. Both are integrative aspects of the numerous influences arising from the primary controls of geology and climate on an eroding stream basin. The characteristics of a number of gaged stream basins which have all formed in the same general geologic and climatologic regime were regressed against the baseflow characteristics of those basins. The results indicate the usefulness of the saturated-soil cover but not the hypsometric integral in predicting the exceedance values within streams formed on similar geology and in the same general area. The water supply capacity of a reservoir was then assessed using the regression formula developed from gaged streams, and was found to be operating at a level consistent with the design estimate of safe-yield under climate conditions that can be considered as normal. ENVIRONMENTAL ISOTOPES AS A TOOL IN HYDROGEOLOGICAL RESEARCH IN AN ARID BASIN,

Ben-Gurion Univ. of the Negev, Sde Boker (Israel). In for Desert Research.
A. Issar, and J. Gat.
Ground Water, Vol 19, No 5, p 490-494, September/October, 1981. 4 Fig, 1 Tab, 11 Ref.

Descriptors: *Isotope studies, *Groundwater recharge, Geohydrology, Recharge, Tracking techniques, Groundwater movement, Precipitation, Evaporation, Wadi Feiran, *Isopotic tracers, A-Tor, Infiltration, Chemical composition, Alluvial plains, Paleohydrology, Geologic fractures, Salinity, Arid lands, Deuterium, Tritium, *Israel.

Stable and radioactive isotopes (deuterium, tritium, 018, and C14) were studied in groundwaters of the Wadi Feiran basin, Israel. The isotopic character of the waters allowed classification into four distinct groups. This information, combined with chemical analyses, was used to characterize the groundwater flow in this region. In the upper part of the basin some of the precipitation and snowmelt penetrates the shallow fractures of the crystalline rocks and flows out immediately as small springs. The spring water maintains the isotopic character of the precipitation. The remainder of the water penetrates into deeper fractures, maintaining its deuterium and 018 ratios while part of the tritium decays. This water continues on a longer route, picking up salts and showing evaporation trends. In the middle part of the basin, water which reaches the riverbed is rich in tritium, shows slight evaporation, and is otherwise similar to precipitation in isotopic composition. In the lower part of the basin, groundwater flows into the alluvial plain at A-Tor. Some water mixes with paleowater and emerges as thermal springs. (Cassar-FRC)

THE ORIGIN AND EVOLUTION OF SALINE FORMATION WATER, LOWER CRETACEOUS CARBONATES, SOUTH-CENTRAL TEXAS, U.S.A.,

Texas Univ. at Austin. Dept. of Geological Sciences.
L. S. Land, and D. R. Prezbindowski.
Journal of Hydrology, Vol 54, No 1-3, p 51-74, December, 1981. 7 Fig, 2 Tab, 41 Ref.

Descriptors: *Sedimentary basins, *Model studies, *Brines, *Groundwater movement, Faults, Mineralization, Carbonates, *Sedimentary petrology, Groundwater, Saline water, Aquifers, Minerals, Petrology, Mineral water, Thermal springs, Formation water, Thermal water, Sodium, Calcium, Geohydrology, Chlorine, Geologic fractures, Saline formation water, Gulf of Mexico basin, Texas.

Chemical variation that exists in formation water from a dip section through Lower Cretaceous rock in south-central Texas was explained by an interactive water-rock diagenetic model. Major faults serve as pathways for the vertical movement of basinal brines from the Gulf of Mexico basin into the Lower Cretaceous section. As the brine moves updip out of the Gulf basin and encounters limestone along the Stuart City Reef Trend, galena precipitates in late fractures. As the Ca-rich brine continues its upfault rise, it becomes progressively diluted until it causes dedolomitization along back-reef facies. Although minor amounts of calcite spar are present, no precipitation of authigenic phases has been found. As the brine is diluted and cooled, it also gains in Mg as a result of progressive dedolomitization. The formation water discharges along faults as hot mineral water. (Geiger-FRC)

J. Sarrot-Reynauld, J. Rochat, and J. Dazy.
Journal of Hydrology, Vol 54, No 1-3, p 33-50, December, 1981. 5 Fig, 1 Tab, 30 Ref. (English Summary).

Descriptors: *Groundwater, *Spring water, *Thermal water, *Mineral water, Petrology, *Geochemistry, *Trace elements, Water analysis, Anions, Cations, Geohydrology, Water properties, Chemical properties, Minerals, Geologic formations, Groundwater recharge, Mineral springs, Mineralization, Sedimentary rocks, Metamorphic rocks, Granites.

Research on spring waters in Southern France and Iran was applied to the study of the origin and mineralization of thermal waters. Characteristic ratios between major and minor water constituents as well as the behavior of trace elements such as B, F, Br, I, Sr, Rb and Li allow distinctions to be made among thermal and mineral waters associated with granitic, metamorphic, or volcanic rocks or with sedimentary evaporates. The distribution of trace elements depends upon magmatic properties, wallrock chemical composition, the presence of large distended fractures and temperature. Eroded-rock types may be identified by the Br/I or Sr/Rb ion ratios of groundwater. Since the occurrence of Cl is relatively independent of the other halogens, this anion is thought to originate from a different source when it is present in mineral water. (Geiger-FRC)

Journal of Hydrology, Vol 54, No 1-3, p 23-32, December, 1981. 4 Fig, 2 Tab, 5 Ref.

Descriptors: *Geohydrology, Groundwater recharge, *Spring water, *Aquifers, *Geochemistry, *Isotope studies, Physicochemical properties, Tectonics, Borehole geophysics, Groundwater, Water properties, Minerals, Chemical analysis, Water analysis, Chemical properties, Crystalline rocks, Aquifer systems, Geologic fractures, Petrology.

Spring water from Precambrian rock strips encompassing the coast of Sao Paulo was studied for relationships between lithology and the physicochemical properties of the water. Water from crystalline rock was classified as Ca-Mg-bicarbonate with low temperature and conductivity. Spring water arising from sediments and/or weathered crystalline rock contained Ca-Mg-chloride-sulfate. Na-bicarbonate water was associated with volcanic rock, diabase and basalt. Monthly isotopic analyses carried out on eight springs and rain water samples from the Aguas da Prata region indicated a local source of recharge. Chemical studies of the waters of the shallow Bauru and Basalto aquifers of the Parana Basin suggest recharge from the confined deep Botucatu-Piramboia aquifer through large fractures and faults. This hypothesis is strengthened by evidence of a tectonic disturbance within the anomaly zone of these aquifers. (Geiger-FRC)

BOUNDARY INTEGRAL EQUATION SOLUTIONS TO MOVING INTERFACE BETWEEN TWO FLUIDS IN POROUS MEDIA,

Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
P. L-F. Liu, A. H-D. Cheng, J. A. Liggett, and J. H. Lee.
Water Resources Research, Vol 17, No 5, p 1445-1452, October, 1981. 11 Fig, 2 Tab, 16 Ref.

Descriptors: *Interfaces, *Porous media, Saline-freshwater interfaces, Upconing, *Coastal aquifers, *Saline water intrusion, Encroachment, Saline water, Seawater, Aquifers.

The position of the boundary between two immiscible fluids is accurately predicted after a period of time by use of the Dupuit-Forchheimer approximation. For intermediate and short times the use of the boundary integral equation method (BIEM) forms an accurate alternative. The location of a saltwater wedge under conditions of unsteady seaward flow of fresh water is difficult to predict with any technique, but the BIEM appears to do an adequate job. The expansion of this method to three dimensions would aid in the case of complex geometry. Such a program could be developed from the methods cited in this paper combined with those of Lennon. In the BIEM method the mixing between two fluids is assumed to be insignificant, with a sharp interface existing between them. Numerical and experimental results are presented for the tilting of a vertical interface in a Hele-Shaw cell. During the initial stage of the interfacial movement, nonlinear effects are clearly demonstrated. (Baker-FRC)

PATTERNS OF GROUNDWATER SALINITY CHANGES IN A DEEP CONTINENTAL-OCEANIC TRANSECT OFF THE SOUTHEASTERN ATLANTIC COAST OF THE U.S.A.,

Scripps Institution of Oceanography, La Jolla, CA.
F. T. Manheim, and C. K. Paull.
Journal of Hydrology, Vol 54, No 1-3, p 95-105, December, 1981. 3 Fig, 1 Tab, 28 Ref.

Descriptors: *Groundwater pollution, *Brines, Boreholes, Subsurface water, Geohydrology, Sodium chloride, Petrology, *Waste disposal, Subsurface mapping, Saline water, Permeability, Dissolved solids, Sedimentary basins, Chemical properties, Salinity, *Saline water intrusion, *Coastal aquifers, *Georgia coast.

Increased interest in using subsurface strata as waste disposal sites, in problems involving seawater encroachment, and in extension of the concept of 'freshwater resources' to water containing as much as 10 grams/kilogram total dissolved solids has increased interest in the composition and distribution of saline fluids in sedimentary strata. Studies of formation-fluid salinities in a transect from western Georgia to the edge of the Blake Plateau off the Georgia coast reveal similar offshore and onshore hydrochemical properties. A wedge of fresh-brackish groundwater is located about 900 m below the shelf, while on the land, brackish waters extend to a maximum depth of 1,200 m below sea level. In deeper horizons, brines with salinities greater than 100 grams/kilogram are found in what is thought to be Cretaceous strata that are anhydritic in the offshore area. Evaporitic deposits are also found at drill sites beneath the Blake Plateau, as evidenced by strong salinity gradients in interstitial waters. (Geiger-FRC)

CHARACTER OF BRINES FROM THE BELLE ISLE AND WEEKS ISLAND SALT MINES, LOUISIANA, U.S.A.,

Louisiana State Univ., Baton Rouge. Inst. of Environmental Studies.
M. B. Kumar, and J. D. Martinez.
Journal of Hydrology, Vol 54, No 1-3, p 107-140, December, 1981. 20 Fig, 23 Ref.

Descriptors: Geohydrology, *Brines, Water analysis, *Mine drainage, Minerals, *Chemical analysis, *Isotope studies, *Groundwater, Sodium, Calcium, Trace elements, Chemical properties, Salinity, Saline water, Ions, Anions, Cations, Salt mine, Belle Isle, Weeks Island, *Louisiana.

Chemical analyses of 110 samples of brines collected from active leaks, puddles, stalagmites and stalactites from the Belle Isle and Weeks Island salt mines were conducted and compared with the ionic compositions of average seawater, seawater concentrated by evaporation, and oil-field brine formation waters. Salt mine brines were mostly Na-Ca-Cl brine with minor amounts of ionic species, especially K, Br, B, and Sr. The mine brines resembled formation waters in their ionic distributions but showed higher levels of K and Pr, suggesting some genetic relationship to a residual brine. The high concentration of Ca in the water, however, was highly indicative of formation water, and an admixture of a Ca-rich formation water with a K-Br-rich residual brine was hypothesized. Isotopic studies tend to support the theory that the salt mine brines arise from a formation water with unusually high levels of Ca, K and Br. (Geiger-FRC)

DISSOLUTION OF SALT ON THE EAST FLANK OF THE PERMIAN BASIN IN THE SOUTHWESTERN U.S.A.,

Geological Survey, Norman, OK.
K. S. Johnson.
Journal of Hydrology, Vol 54, No 1-3, p 75-93, December, 1981. 8 Fig, 1 Tab, 22 Ref.

Descriptors: *Geohydrology, *Brine, *Groundwater movement, *Sodium chloride, *Saline water, Groundwater, Aquifers, Permeability, Percolation, Minerals, Groundwater recharge, Petrology, Spring water, Hydrostatic level, *Permian Basin, Southwestern United States, Dissolved solids.

Hydrogeologic surveys of the Permian Basin of the southwestern United States show that natural dissolution of bedded salt occurs at shallow depths in many parts of this basin, especially on the Cimarron River, Elm Fork, and the Red River. In order for a salt deposit to dissolve, a supply of water unsaturated with respect to NaCl, an outlet for removal of brine, and energy to cause water to flow through the system are required. Salt is dissolved by groundwater at depths of 10 to 250 m, and the resulting brine moves laterally and upward under hydrostatic pressure through caverns, fractures and aquifers to form salt plains and salt springs on the surface. Groundwater in the Permian Basin is recharged through permeable rocks, alluvium, terrace deposits, karstic features and fractures. The dissolution of salt causes a self-perpetuating cycle in some areas. Cavern development caused by salt dissolution is followed by collapse and subsidence of overlying rock, allowing greater vertical permeability and increased water percolation and additional salt dissolution. (Geiger-FRC)

SEEPAGE FLOW IN EXTREMELY THIN AQUIFERS,

Bochum Univ. (Germany, F.R.). Inst. fuer Konstruktiven Ingenierbau.
G. Schmid.
Advances in Water Resources, Vol 4, No 3, p 134-136, September, 1981. 3 Fig, 2 Ref.

Descriptors: *Groundwater movement, *Solute transport, Model studies, Mathematical studies, Seepage, *Nitrates, Path of pollutants, Flow velocity, Aquifer characteristics, *West Germany.

A groundwater flow model, considering only a vertical cross-section of a thin aquifer, was used to simplify an investigation of the source of 130 ppm nitrate levels at a water-works in West Germany. The stream function approach to describing seepage flow was useful, since the velocity field and flow path were of primary interest. Although the aquifer was only 9 mm thick and 2 km in a horizontal direction, the stream function produced the desired flow field. The potential approach gave a one-dimensional solution, neglecting the vertical components. (Cassar-FRC)

ESTIMATING AQUIFER PARAMETERS FOR LARGE-DIAMETER WELLS,

Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton, and S. M. Holt.
Ground Water, Vol 19, No 5, p 505-509, September/October, 1981. 4 Fig, 10 Ref.

Descriptors: *Well hydraulics, *Aquifer characteristics, *Model studies, Transmissivity, Pumping tests, Permeability, Confined aquifers, Unconfined aquifers, Shallow wells, India, Drawdown, Storage coefficient, Permeability.

Aquifer parameters were determined from pumping tests in large diameter wells by two methods--the curve matching technique based on analytical solutions and a numerical model. Both methods gave similar results under confined aquifer conditions. However, the curve matching technique was not reliable for use in unconfined aquifers where there is a significant decrease in saturated depth. In a confined aquifer test water was pumped at 691 cu m per day for 135 min from a well with a 2.4 m radius. Transmissivity was calculated at 24-29 sq m per day; storage coefficient, 0.0006 to 0.001; and effective radius, 2.3 m. The unconfined aquifer test used a well with 3.5 m radius and 10.73 m deep. Abstraction rate fell from an initial 1539 cu per day to 930 cu per day over 4 hours. Drawdown was 1.77 m. According to the numerical model, permeability was 105 m per day; storage coefficient, 0.007. The curve matching method gave unrealistic results: permeability of 68 m per day and storage coefficient of 0.0001. (Cassar-FRC)

ANALYSIS OF GROUND-WATER HYDROGRAPHS FOR DEFINING A CRYSTALLINE HYDROGEOLOGICAL ENVIRONMENT,

Osmania Univ., Hyderabad (India). Centre of Exploration Geophysics.
B. H. Briz-Kishore, and V. L. S. Bhimasankaram.
Ground Water, Vol 19, No 5, p 476-481, September/October, 1981. 8 Fig, 2 Tab, 4 Ref.

Descriptors: *Groundwater, *Geohydrology, Precipitation, Rainfall, Groundwater recharge, Geology, Topography, Terrain analysis, Water wells, Water level, Hydrographs, *India, Shadnogar Basin.

Analysis was made of water levels in wells in a typical weathered and fractured granitic environment of Shadnagar Basin, Andhra Pradesh, India. Each well was 15.24 cm in diameter and ranged in depth from 24 to 60 m bgl (below ground level). It was noted that the level at which water was encountered during drilling was always lower than the stabilized water levels. The level of water striking varied from 5.25 to 21.25 meters. Similarly the static water levels in the wells varied from 0.75 to 16.38 meters, which is higher than the water striking levels in the wells. The rise of water levels to the stabilized levels clearly indicates the pressure heads of the granitic aquifer and reveals the semiconfined nature of the system. Topography had no definite control over the water striking levels, but in the upland areas the water levels are deeper, with relatively low pressure heads as compared to the low-lying areas. Water levels for all the piezometer tubes in different nests were manually recorded at monthly intervals over a period of five years. Data indicate that there is a good hydraulic continuity between ground water in shallow weathered mantle and deep seated fractured zones. The influence of rainfall on the ground water system was also investigated. It was concluded that rainfall on the ground water system was also investigated. It was concluded that rainfall was the main source of recharge, and that there are no substrate inputs to the ground water system in the basin. (Baker-FRC)

ISOTOPE HYDROLOGY OF GROUNDWATERS IN THE PAMPA DEL TAMARUGAL, CHILE,

Waterloo Univ. (Ontario). Dept. of Earth Sciences.
P. Fritz, O. Suzuki, C. Silva, and E. Salati.
Journal of Hydrology, Vol 53, No 1-2, p 161-184, September, 1981. 1 Fig, 4 Tab, 14 Ref.

Descriptors: *Isotope studies, *Groundwater dating, *Surface-groundwater relations, *Groundwater recharge, Isotopic tracers, Groundwater depletion, Altitude, Geohydrology, Groundwater level, Boreholes, Meteoric water, Groundwater availability, Spring water, Surface runoff, Semiarid climates, *Chile.

The semi-arid regions of Northern Chile have limited potential for water resources development. The isotope hydrology of the groundwaters of the arid Pampa del Tamarugal was studied to identify present-day groundwater recharge areas. Background studies on precipitation in the high Andes and spring- and surface-water investigations identified a well-defined meteoric water line. Altitude effects which were dependent on air-mass movements could not be defined without a more extensive sampling program. Maximum altitudes of recharge were assignable to springs in the Andes and at the eastern border of the Pampa del Tamarugal which originated from infiltrating surface waters. Certain groundwater systems were traced to specific river valleys, but most of the pumped groundwaters are fossil and their supply is diminishing. Limited subsurface recharge activity was found at the foot of the Andes, but this does not seem to keep up with groundwater depletion in this area. (Geiger-FRC)

HYDROLOGY AND MINING IN THE TUCSON AREAS,

Harshbarger and Associates, Tucson, AZ.
J. W. Harshbarger, and D. R. Hargis.
Mining Engineering, Vol 33, No 11, p 1611-1616, November, 1981. 5 Fig, 9 Ref.

Descriptors: *Groundwater basins, *Water management, Hydrology, Water demand, Water supply, *Arizona, Water supply development, Groundwater mining, Water reuse, Wastewater irrigation, *Tucson area.

The importance of groundwater supplies in the Upper Santa Cruz Valley is extreme. Metropolitan Tucson, surrounding agricultural areas, and the mineral industry are completely dependent on groundwater. Agriculture has been the largest user. Mountains bordering the Tucson Basin are composed predominantly of metamorphic and igneous intrusive rocks. The Tucson Basin comprises a structural depression formed by block faulting. The major fault system occurs along the base of the mountains. Principal surface drainage in the Tucson use area is the Santa Cruz River. In the past, pumpage of groundwater for agricultural use has been the major factor in the decline of basin water levels. As municipal and industrial pumpage in the area increases, a continuing decline in the water level can be expected. Irrigation use probably will not increase significantly, but utilization of effluent from the Tucson sewage treatment facility for agricultural irrigation in the future may decrease the volume of agricultural ground water pumpage. Groundwater law in Arizona developed prior to the accumulation of a body of significant scientific knowledge concerning groundwater occurrence and movement. Much work is needed in this area. THE ROLE OF PORE PRESSURE IN DEFORMATION IN GEOLOGIC PROCESSES,

T. N. Narasimhan, W. N. Houston, and A. M. Nur.
Geology, Vol 8, No 7, p 349-351, July, 1980.

Descriptors: *Pore pressure, *Deformation, *Hydraulic fracturing, Aquifers, Groundwater movement, Reservoirs, Seismology, Stress, Fluid mechanics, Geothermal studies, Geohydrology, Pressure head, Subsidence, Porous media.

Hydraulic fracturing and seismicity vs. pore pressure were among the areas of discussion at an interdisciplinary Penrose Conference on pore pressure and deformation sponsored by the Geological Society of America, November 9-13, 1979. This subject is important in many fields, for example, development of water resources and geothermal resources. One of the questions discussed was the maximum depth of groundwater circulation, believed to persist down to 20 km. Studies on stress-strain behavior of fluid-saturated rocks suggest that in some rocks (Cosco granite) the bulk modulus is sensitive to saturation, but in others (Solenhofen limestone) it may not be. Reservoir-induced seismicity research is being actively pursued. It is probable that migration of pore pressure transients is critical to induced seismicity. Hydraulic fracturing is used to measure stress in situ and to augment production of water, geothermal fluids, and oil. Fundamental studies on this subject included the nature and disposition of hydraulic fractures, conditions of stable and unstable fracture growth, growth of long elliptical cracks, and the role of the rate of fluid pressurization in controlling fracture disposition. Rapid pressurization tends to produce vertical fractures; slow pressurization, horizontal fractures. The following mechanisms, including some chemical effects, can contribute to abnormally high pore pressures: aquifer head due to natural recharge, fossil head due to exhumationor erosion, tectonic compression, rapid loading and compaction, influx of juvenile water, gas infiltration, phase changes in minerals or hydrocarbons, temperature changes, and osmotic phenomena. 2G. Water In Soils

RELATION BETWEEN PHC AND SODIUM ADSORPTION RATIO (SAR) AND AN ALTERNATIVE METHOD OF ESTIMATING SAR OF SOIL OR DRAINAGE WATERS,

Science and Education Administration, Riverside, CA. Salinity Lab.
D. L. Suarez.
Soil Science Society of America Journal, Vol 45, No 3, p 469-475, May/June, 1981. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Saline water, *Irrigation effects, *Saline soils, Water analysis, Estimating equations, Mathematical studies, Irrigation, Water quality, Soil environment, Soil contamination, Hydrogen ion concentrations, Sodium, Sodium adsorption ratio.

An equation was derived which demonstrates the inter-relationships between the sodium adsorption ratio (SAR) of drainage water, irrigation water composition, pH, and the leaching fraction. SAR is used to predict the exchangeable sodium percentage of a soil. The accuracy of the new equations was evaluated by comparing the predicted SAR for drainage water of different water types and leaching fractions against computer model predictions. This method was found to predict SAR better than existing empirical equations. Satisfactory results can be obtained with rough estimates of P of CO2, as SAR is not very sensitive to this variable. SAR is also not particularly sensitive to the concentration of Ca under saline conditions and with Mg/Ca ratios greater than 1. Thus, a fair prediction of Ca can result in a good SAR prediction. If soil water SAR is being calculated, SAR surface can be estimated from the irrigation water SAR, or if groundwater is important, some corrections must be made for degassing and CaCO3 precipitation. MASS TRANSPORT. 3. ROLE OF HYDRAULIC CONDUCTIVITY DATA IN PREDICTION,

British Columbia Univ., Vancouver. Dept. of Geological Sciences.
L. Smith, and F. W. Schwartz.
Water Resources Research, Vol 17, No 5, p 1463-1479, October, 1981. 14 Fig, 6 Tab, 13 Ref.

Descriptors: Conductivity, *Model studies, Stochastic process, Mathematical studies, *Mass transfer, Prediction, Stochastic hydrology, Forecasting, *Solute transport, *Hydraulic conductivity.

A stochastic analysis of mass transport has been carried out to investigate various relationships between the number of hydraulic conductivity measurements available to characterize the heterogeneity and the resulting uncertainty in transport predictions. Uncertainties arise both from the unknown spatial variation in hydraulic conductivity and in estimating the parameters of the probability distribution for hydraulic conductivity. Simulations were based on limited sampling of hydraulic conductivity values from a series of hypothetical field sites. Results were interpreted, keeping in mind the uncertainty in determining seepage velocities within the flow system. For the sample grids considered, the mean arrival times obtained in the stochastic simulation can differ significantly from arrival times calculated for the hypothetical section representing the field setting. Measurements of hydraulic conductivity did not lead to large reductions in the uncertainty in the velocity field, as the hydraulic gradient itself was a random variable. Results of the study suggest that given a moderate number of data points, the unknown patterns of spatial variation in hydraulic conductivity were a more important source of uncertainty than errors in estimating the mean and standard deviation of the hydraulic conductivity distribution. APPLICATION OF SOIL WATER FLOW THEORY IN FIELD SIMULATION,

Technical Univ. of Denmark, Copenhagen.
K. H. Jensen.
Nordic Hydrology, Vol 12, No 3, p 167-184, 1981. 12 Fig, 1 Tab, 9 Ref.

Descriptors: *Soil-water-plant relationships, *Evapotranspiration, *Irrigation practices, Soil moisture, *Model studies, Capillarity, Infiltration, Interception, *Soil water, Evaporation, Grasses, Barley, Soil water movement.

A soil moisture model based on the basic differential equation for soil water flow is developed. It includes terms for interception, transpiration, soil evaporation, and soil water flow. Empirical relationships from the literature are used where mathematical descriptions are unavailable. Input data to the model are hourly precipitation and meteorological data, irrigation treatment, leaf area index, root zone depth, root extraction pattern, and water table fluctuations. Required model parameters are moisture content-capillary pressure relationships and hydraulic conductivity-capillary pressure relationships for each soil layer. Outputs are simulated time variation in soil moisture content, capillary pressure, and soil water flow at different levels. The model results agreed fairly well with field observations on grass and barley plots in Denmark. (Cassar-FRC)

AIRBORNE SOIL MOISTURE MEASUREMENT USING NATURAL TERRESTRIAL GAMMA RADIATION,

National Weather Service, Minneapolis, MN. North Central River Forecast Center.
T. R. Carroll.
Soil Science, Vol 132, No 5, p 358-366, November, 1981. 3 Fig, 2 Tab, 22 Ref.

Descriptors: *Remote sensing, *Soil water, Measuring instruments, *Gamma radiation, Radiation, Water availability, Moisture availability, Moisture stress, Drought, Moisture deficiency.

Airborne gamma radiation flux data were collected over a network of 240 flight lines in the upper Midwest. Each flight line was approximately 6 square kilometers. The data were used to calculate real-time, areal soil moisture values. The gamma radiation attenuation technique was able to measure the soil moisture flux in the upper 20 cm of the soil surface with sufficient accuracy for operational applications. A comparison with soil moisture data collected from a network of 240 flight lines in the upper Midwest indicates that mean areal soil moisture values can be calculated with an RMS error of 3.2% soil moisture. Airborne soil moisture values tended to be 1.5% less than the ground sampled values. The airborne gamma radiation technique was able to measure reliable, real-time mean, areal soil moisture values over large areas with the accuracy required for operational hydrologic and agricultural applications. An operational soil moisture survey program could make real-time data available to users interested in soil moisture conditions in the fall prior to snow accumulation, in the spring to assess surface conditions prior to crop planting, or at any time to quantify extremely wet or dry soil moisture conditions over large areas. NONLINEAR SORPTION OF WATER IN SOIL,

Vanderbilt Univ., Nashville, TN.
A. D. Koussis.
Soil Science, Vol 132, No 4, p 262-266, October, 1981. 3 Tab, 14 Ref.

Descriptors: *Soil water, *Model studies, Mathematical studies, Sorption.

The accuracy of an approximate analytical solution, based on integral requirements, for nonlinear sorption of water in soil has been studied. An earlier solution proposed by Brutsaert has been obtained as a special case through a particular parameter choice. Comparisons with exact solutions have been carried out for a power law soil. Results bear out the expectation that Brutsaert's approach will be simple and accurate over a wide range of diffusivities, from weakly variable to strongly variable. Although the accuracy of Brutsaert's solution is not as high as that of the general integral-approximation solution, its performance is more than adequate for practical purposes and proves it a versatile and flexible tool. Also, suggestions regarding the improvement of the computational efficiency of iterative numerical integration of the one-dimensional diffusion equation are made, which are based on available close estimates for the sorptivity. DEVELOPMENT OF A SOIL MOISTURE MODEL FOR USE WITH PASSIVE MICROWAVE REMOTE SENSORS,

Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
W. C. Bausch.
PhD Thesis, May, 1980. 187 p, 82 Fig, 10 Tab, 55 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-23014.

Descriptors: *Soil water, *Model studies, *Mathematical models, Soil profiles, *Remote sensing, Prediction, Moisture content, Passive microwave sensors.

Soil moisture profiles were simulated for a hypothetical loam-like soil with a water and heat balance model. Expected X-band and L-band radiometer response to these conditions as simulated by a radiative transfer model. From these simulations, a model was developed to estimate soil water content in two layers of a 1.5 m soil profile. Soil water content in the top 21 cm of the hypothetical soil was related to L-band emissivity over a wide range of soil moisture conditions. Inverted soil moisture profiles which result from small rains were classified by use of the rate of change in L-band emissivity one day after the rain. The amount of water added to the soil profile below the 21 cm depth due to percolation was related to a ratio of the rate of change in X-band and L-band emissivities one day after the rain. These relationships were combined into a comprehensive model that predicts soil moisture in two zones of the soil profile. This model was tested with measurements of soil water content and soil temperature collected during the four seasons of the year in a sandy loam soil contained in an array of lysimeters. X-band and L-band emissivities required in the predictor equations were calculated by the radiative transfer model from measured soil moisture and soil temperature data. The technique developed from simulated results to classify inverted soil moisture profiles was found to be seasonally dependent. It was also found that the second layer algorithm showed seasonal dependence. (Sinha-OEIS)

AERATION STATUS OF A STRATIFIED SOIL WITH A FALLING WATER TABLE,

Utah State Univ., Logan.
M. Z. Ahmadi.
PhD Thesis, 1980. 167 p, 37 Fig, 29 Tab, 72 Ref, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-19230.

Descriptors: *Soil aeration, *Model studies, *Water table, Mathematical models, Equations, Aeration, Soil water, Moisture content, Oxygen, Soil types, Stratified soils, Soil water pressure.

Two Richards type equations were used to define soil aeration status, one for soil water pressure and one for oxygen concentration. A third equation related the soil water pressure (volumetric water content) with oxygen concentration and oxygen diffusion rate for a one-dimensional vertical stratified soil column. The equations were solved using Brooks-Corey's functional relationship between soil water pressure and volumetric water content, the Crank-Nicolson method of differencing, general Newton method, successive overrelaxation. The numerical model considers uniform and two-layered soils; plants and no plant; and saturated and unsaturated conditions for a falling water table. The model predicts soil water pressure, volumetric water content and oxygen diffusion rate throughout the column at any time step following an initial static water table location. The no-plant numerical model was tested against laboratory data. Except for the oxygen diffusion rates near the soil surface which are not reliable due to malfunctioning of oxygen diffusion rate meter, the no-plant model, in general agrees with the laboratory data. (Sinha-OEIS)

MOISTURE MOVEMENT IN SOILS IN THE VICINITY OF WASTE DISPOSAL SITES,

Texas Univ. at Austin.
D. E. Daniel, Jr.
PhD Thesis. December, 1980. 256 p, 81 Fig, 6 Tab, 117 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-09151.

Descriptors: *Soil water, *Computer programs, *Waste disposal, Soil properties, Hydraulics, Soil water suction, Saturation, Hydraulic conductivity, *Unsaturated flow, Solute transpot.

Four objectives to the research were: (1) to study methods of measuring the hydraulic properties of unsaturated soil over a broad range in degree of saturation; (2) to develop a computer program for analyzing the transient movement of water through saturated or unsaturated soil; (3) to measure rates of water movement in several unsaturated soils and to compare the measured rates to those predicted by the computer program; and (4) to analyze an example disposal facility in order to illustrate how the program might be used for practical problems. The main conclusions are: The most important hydraulic properties of unsaturated soil are the moisture characteristic curve (plot of degree of saturation versus suction) and the relationship between hydraulic coductivity and degree of saturation. The thermocouple psychrometer is the best device to use for measuring suctions over the range of about 1 to 80 atm. The instataneous profile method, with psychrometric suction probes, was found to be the best method available for measuring hydraulic conductivity of clays over a wide range in degree of saturation. The most useful features of the fnite element program, which was written to calculate the time-dependent change in hydraulic head, and associated variables such as degree of saturation, were found to be the following: dynamic dimensioning, semi-automatic mesh generation, time-dependent or cyclic boundary conditions, automatic time step control, and the capability of tracing the time-dependent movement of water through the ground. Analysis of an example problem showed that the ability of the program to trace the time-dependent movement of water through the soil is the most useful feature of the program. (Sinha-OEIS)

2H. Lakes

PHOTOSYNTHETIC BACTERIAL PRODUCTION AND CARBON MINERALIZATION IN A MEROMICTIC LAKE,

Michigan State Univ., East Lansing. Dept. of Crop and Soil Science.
T. B. Parkin, and T. D. Brock.
Archiv fur Hydrobiologie, Vol 91, No 3, p 366-382, June, 1981. 5 Fig, 2 Tab, 26 Ref.

Descriptors: *Carbon cycle, *Meromictic lakes, *Photosynthetic bacteria, Lakes, Bacteria, Primary productivity, Productivity, Sedimentation, Sulfur bacteria, Mineralization, Algae, Phytoplankton.

Primary production, sedimentation, and decomposition were measured in meromictic Knaack Lake, Wisconsin, throughout the annual cycle. During thermal stratification in spring, summer, and early autumn a dense population of photosynthetic sulfur bacteria was present at the oxygen-sulfide boundary. When the lake ice melted in April, bacterial chlorophyll d concentrations increased steadily to over 800 mg per sq m during the summer and decreased in October. Although green and blue-green algae were present in the epilimnion, chlorophyll a concentrations were low (20-90 mg per sq m) during summer. The photosynthetic sulfur bacteria composed 41-92% of the total phytoplankton standing crop on a chlorophyll basis and 8-58% on a carbon basis. However, they were responsible for only 3.3-5.6% of the total primary production in the lake. The algae of the epilimnion showed rapid turnover rates, whereas the green sulfur bacteria of the hypolimnion had slow turnover rates. (Cassar-FRC)

NUTRIENT RELATIONSHIPS IN SHALLOW WATER IN AN AFRICAN LAKE, LAKE NAIVASHA,

Nairobi Univ. (Kenya). Dept. of Botany.
J. J. Gaudet, and F. M. Muthuri.
Oecologia, Vol 49, No 1, p 109-118, 1981. 9 Fig, 3 Tab, 37 Ref.

Descriptors: *Cycling nutrients, *Lakes, Seasonal variations, *Africa, *Lake Naivasha, Littoral zone, Intertidal areas, Littoral environment, Interstitial water, Shallow water, *Nutrients, Phosphorus, Nitrogen, Sulfur.

Total nutrient levels of nitrogen, phosphorus, and sulfur were determined in a shallow water tropical community with emphasis directed toward the macrophyte, water and hydrosoil components. Nutrient release from macrophyte decomposition was studied, and general transfer patterns within this macrophyte-water-hydrosoil system were sought. The area under study was located at the edge of

Lake Naivasha, a closed-basin lake in East Africa. One long permanent transect was set out from land to the open lake, with five stations located along it. One sampling station was located in a zone dominated by Kikuyu grass, stations 2, 3, and 4 were in a sledge zone, and station 5 was in open water. The mean annual conductance and temperature decreased, while pH increased going out from shore as water depth increased. Total P was generally higher during drawdown (June-July), decreasing later in the year. The concentration of particulate P was greater than dissolved P. The ratio of the two forms of P differed from zone to zone. Total nitrogen concentrations were higher than either phosphorus or sulfur, with the highest mean annual concentration occurring in the sledge zone and the least concentration in the open water. Highest mean phosphorus and sulfur levels were generally found in the grass zone. Of the three nutrients, total sulfur was generally at the lowest overall concentration. The main source of plant nutrients in the drawn-down zone of Lake Naivasha would seem to be the interstitial water filling the space among the solid particles of the hydrosoil. (Baker-FRC)
W82-03404

GROWTH AND REPRODUCTION OF POTAMOGETON CRISPUS IN A SOUTH AFRICAN LAKE,

Natal Univ., Pietermaritzburg (South Africa). Dept. of Botany.
K. H. Rogers, and C. M. Breen.
Journal of Ecology, Vol 68, No 2, p 561-571, July, 1980.

Descriptors: *Potamogeton, *Nutrients, *Aquatic plants, *South Africa, *Lakes, Nitrogen, Phosphorus, Plant physiology, Standing crops.

Potamogeton crispus L. plants are involved in the nutrient dynamics of their floodplain lake environment. They grow and take up nutrients from water and sediments from autumn to spring, at which time the vegetative parts decay and release nutrients to the water. Between September 8 and January 9 a mean of 2 mg per sq meter per day of phosphorus and 7 mg per sq meter per day of nitrate-N was released for uptake by other components of the system. During the summer, when P. crispus is dormant, the lakes in this South African floodplain are separated from their river source. If a flood were to occur at this time (an unlikely happening), nutrients would be washed out by the nutrient-poor flood water. (Caesar-FRC)

ALGAL SEDIMENTATION IN RELATION TO PHYTOPLANKTON PERIODICITY IN ROSTHERNE MERE,

Freshwater Biological Association, Ambleside (England).
D. Livingstone, and C. S. Reynolds.
British Phycological Journal, Vol 16, No 2, p 195-206, June, 1981. 9 Fig, 3 Tab, 19 Ref.

Descriptors: *Phytoplankton, *Sedimentation, *Seasonal variation, Algae, *Rostherne Mere, *England, Turbulent flow, Sediment traps, Lakes, Measuring instruments, Diatoms.

Seasonal variations in phytoplankton composition were studied in Rostherne Mere, England, using cylindrical sediment traps and quantitative measurements of standing crops. Trap catches generally reflected the plankton compositon during the preceding trapping period when operated in weakly turbulent waters. Turbulence, which is infrequent in this lake, exaggerated the fluxes. Diatoms were assessed as 2-20 times more numerous using the trap than standing crop estimates. Microcystis and Nitzschia catches were in good agreement with estimated areal fluxes. (Caesar-FRC)

THE PHYTOPLANKTON AND PROTOZOOPLANKTON OF THE EUPHOTIC ZONE OF LAKE TANGANYIKA: SPECIES COMPOSITION, BIOMASS, CHLOROPHYLL CONTENT, AND SPATIO-TEMPORAL DISTRIBUTION,

Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
R. E. Hecky, and H. J. Kling.
Limnology and Oceanography, Vol 26, No 3, p 548-564, May, 1981. 6 Fig, 6 Tab, 33 Ref.

Descriptors: *Lakes, *Phytoplankton, *Zooplankton, Seasonal variation, Population dynamics, Chlorophyll A, *Lake Tanganyika, *Africa, Biomass, Fish food organisms.

Phytoplankton and protozooplankton were surveyed at two widely separated pelagic stations in the euphotic zone of Lake Tanganyika (Africa) from February through November 1975, and three seasonal phases were determined. During stable stratification, biomass was minimal; it was maximal at the end of the deep mixing period. Diatoms were abundant only during mixing. Filamentous blue-greens were abundant when the lake experienced rapid surface warming, which produced shallow mixed layers following the period of deep mixing. Chlorophyll alspha ranged from 0.1 to 4.5 mg/cu m in the euphotic zone and from 0.2 to 20.4 in surface waters. Phytoplankton biomass ranged from 25 to 1570 mg/cu m in the euphotic zone. Annual means for both phytoplankton and chlorophyll alpha were very low and annual variability was high. This may be because of the lake's steep morphometry, which affects nutrient generation, and the high loss rates, which cause high algal growth rates but low algal masses. (Small-FRC)
W82-03419

PRIMARY PRODUCTION AND RATES OF ALGAL GROWTH IN LAKE TANGANYIKA,

Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
R. E. Hecky, and E. J. Fee.
Limnology and Oceanography, Vol 26, No 3, p 532-547, 1981. 3 Fig, 3 Tab, 47 Ref.

Descriptors: *Primary productivity, *Algal growth, *Eutrophic lakes, Aquatic productivity, Biomass, *Lake Tanganyika, *Africa, Fish.

Two surveys were conducted over pelagic regions of Lake Tanganyika (Africa) during minimum and maximum standing crop to determine primary production and rates of algal growth. The mean rate of integral primary production was 1.4 g C/sq m/day for cloudless weather. There was no consistent pattern of diurnal variation. The mean annual rate was estimated to be 1 g C/sq m/day. High algal growth rates of 0.1 to 3.0/day with a mean of 0.9 were estimated. There is a high fish population in the lake, which requires either very high trophic efficiency based on measured pelagic primary production or an additional source of energy derived from the anoxic deep water. It is suggested that the long geological history of the lake has allowed the evolution of a biological community consisting of highly efficient species. (Small-FRC)

A FACTOR ANALYSIS OF ELEMENTAL ASSOCIATIONS IN THE SURFACE MICROLAYER OF LAKE MICHIGAN AND ITS FLUVIAL INPUTS,

Michigan Univ., Ann Arbor. Dept. of Atmospheric and Oceanic Science.
J. E. Mackin, R. M. Owen, and P. A. Meyers.
Journal of Geophysical Research, Vol 85, No C3, p 1563-1569, March, 1981. 5 Fig, 3 Tab, 52 Ref.

Descriptors: *Water analysis, Lakes, *Rivers, *Lake Michigan, Chemical composition, Particulate matter, Calcium, Copper, Iron, Potassium, Manganese, Factor analysis, Metals, Free surfaces, Fluvial environment, Inflow, Water pollution sources.

The concentrations of Ca, Cu, Fe, K, Mn, and organic carbon in samples of the surface microlayer (125 + or - 5 micrometers) and 1 meter deep subsurface water samples from 10 locations in Lake Michigan and 10 of its river sources were subjected to separate R mode factor analyses. These revealed that the variance in the surface microlayer and subsurface river samples was governed by regional geology and the nature of weathering in individual drainage basins. In the particular phase, Ca, Fe, K, and Mn were higher in microlayer and subsurface river samples than in the lake samples because mineral grains settle out before entering the lake. Concentrations of materials in river subsurface waters are also affected by upward diffusion of sediment pore fluids and resuspension of bottom sediments. The variations in chemical composition of the lake samples were a result of physiochemical interactions such as complexation with organic matter (Fe, Cu), carbonate equilibria (Ca, Mn), precipitation of hydrous oxides (Fe, Mn, Cu), biological uptake (K), and bubble transport of very fine mineral particles to the surface. The bubble transport mechanism obscures the patterns of atmospheric fallout of Fe and Mn. (Caesar-FRC)

SIGNAL ANALYSIS OF IRRADIATION, TEMPERATURE AND PRIMARY PRODUCTION IN A SMALL ARTIFICIAL POND, II. THE RESIDUAL SPECTRA,

Amsterdam Univ. (Netherlands). Lab. of Aquatic Ecology.
R. Lingeman.
Internationale Revue der Gesamten Hydrobiologie, Vol 66, No 2, p 203-222, 1981. 6 Fig, 4 Tab, 14 Ref.

Descriptors: *Primary productivity, *Ponds, *Irradiation, Radiation, Temperature effects, Spectrophotometry, Spectral analysis, Dissolved oxygen, Ecosystems.

Methods and results are presented of an extensive spectral analysis applied to the residues of the two-year series of irradiation, temperature and gross production after elimination of the slow components in a small artificial pond. The spectral analysis procedure proposed and executed is for the residual signals of total diurnal irradiation, diel mean temperature and diurnal gross primary production. The residual power spectrum of diurnal irradiation was shown to be essentially that of a white noise. Several higher frequencies were significantly present in both the signals of temperature and production. Some consideration is given to the cross correlation between the latter two parameters. After the detection of possible frequency peaks in the power spectrum had been made, the significance of the periodic components of each signal was tested by least squares fitting to sinusoidal models. Both the spectrum of the temperature and the spectrum of production showed distinct peaks at 2,7, 14, and 21 cy. No peaks were traceable in the power spectrum of irradiation. In the temperature signal, the 2 and 7 cpy periodic components were significant. The production signal had components of 7 and 14 which were significant. The results of spectral estimation and successive model fitting strongly suggest the simultaneous appearance of idnetical frequencies in the residual time series of temperature and production. The synchronous small oscillations superimposed on the annual signals of temperature and primary production may point to a residual effect of temperature on the productive system. (Baker-FRC)

STRATIFICATION AND MIXING IN SHALLOW TROPICAL AFRICAN LAKES,

Duke Univ., Durham, NC. Dept. of Zoology.
S. MacIntyre.
PhD Thesis, 1981. 361 p, 77 Fig, 23 Tab, 134 Ref, 3 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-19639.

Descriptors: *Lakes, *Stratification, *Chemical stratification, *Mixing, *Water circulation, Shallow water, Sedimentation, Primary productivity, Wind, *Kenya, Africa.

Circulation patterns within a lake have a direct impact on the lake's productivity and sedimentation rates and on the fate of pollutants injected into the lake. Shallow windswept African lakes stratify and mix on a daily basis and are noted for their exceptionally high rates of primary productivity. Measurements of current speeds and temperature profiles were used to characterize daily mixing events in three shallow African lakes of differing morphology and exposure to wind. Reasons for the persistence of chemical stratification were explored in a sheltered crater lake. During limnological investigations spanning the 1970's, chemical stratification was always observed in Lake Sonachi. This indicates that the lake is meromictic. Two factors that can contribute to the maintenance of meromixis are weak wind mixing and biological decomposition below the chemocline. Although Lake Sonachi is sheltered from wind by crater walls 30 to 100 m above the lake's surface, gusty winds were common. Freshening of the surface waters by rain contributed to the increased stability, but the conductivity and volume of water below the chemocline had also increased substantially. It is hypothesized that chemical stratification in Lake Sonachi is enhanced by groundwaters that dissolve evaporites in the lake sediments and seep into the lake. (Sinha-OEIS)

INVESTIGATION OF THE ACCURACY OF WATER LEVEL TRANSFER TO DETERMINE GEODETIC ELEVATION IN LAKE ONTARIO,

Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
H. W. Stoughton.
PhD Thesis, 1980. 336 p, 17 Fig, 37 Tab, 380 Ref, 12 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-17375.

Descriptors: *Water level, *Lakes, Mathematical studies, *Geodetic levelling, Lake levels, *Lake Ontario.

An investigation of the accuracy of using the mean surface of a large lake for geodetic levelling is reported. This investigation concentrated on Lake Ontario. The data collected for IFYGL provided adequate information to evaluate mean lake level over widely spaced gage sites. The investigations of lake level for both engineering and geological studies noted the influences of wind setup, variations in barometric pressure, storm runoff, precipitation, and gage location, but it was recognized that there was insufficient data to demonstrate their systematic effect on the mean lake level at a gage. The investigation evaluated the accuracy of geodetic levelling accomplished by the use of mean lake level gage readings for the 'water level transfer' of elevations across Lake Ontario. The employment of this technique requires an elevation system expressing differences in elevation in units of work. This investigation employed the equipotential system based on normal gravity (dynamic heights(because gravity had been observed only at bench marks along the United States portion of the level line. The comparisons of the four month mean difference in elevation as determined by the differences in the lake level gage readings compared to the difference in elevation determined by geodetic levelling were in close agreement. SPACE-TIME SCALES OF TEMPERATURE VARIABILITY IN THE SEASONAL THERMOCLINE OF LAKE TAHOE,

Oregon State Univ., Corvallis.
J. M. Brubaker.
PhD Thesis, June, 1980. 114 p, 31 Fig, 5 Tab, 39 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-05611.

Descriptors: *Lakes, *Thermocline, Thermal stratification, Seasonal variation, *Water temperature, Temperial distribution, Spatial distribution, *Lake Tahoe, Space-time scales.

The objectives of this work are to characterize and, when possible, to interpret temperature finestructure and microstructure observations made with vertical profiling instruments in the upper thermocline of Lake Tahoe during late summer stratification. From the finestructure data (observations with the TD instrument) the following characteristics of temperature variability in the Tahoe thermocline were found. Over time scales of days to weeks, or over horizontal scales of several km, relatively large amplitude temperature fluctuations were observed. In contrast, for sampling limited to 2 1/2 hours and to about 200 m horizontally, the ensemble variability was of smaller magnitude. Vertical wavenumber spectra of temperature fluctuations fell steeply. Results on scales of variability represent only a first step toward development of a full frequency-wavenumber spectrum for the temperature field, but should provide some perspective and organization structure for future work. Similarities of some features of the Tahoe spectra (and cross spectra) to oceanic results support the idea that similar dynamics control the small-scale structure in both environments. Thus, Tahoe could find extensive use as a 'laboratory' for studying some oceanic phenomena. (Sinha-OEIS)

MOVEMENT OF COBALT IN FRESHWATER MICRO-ECOSYSTEMS,

Rutgers - The State Univ., New Brunswick, NJ. Dept. of Environmental Science.
S. S. Tucker.
PhD Thesis, May, 1980. 167 p, 34 Fig, 7 Tab, 115 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-22598.

Descriptors: *Lakes, *Sediments, *Cobalt, *Ecosystems, Aquatic life, Mathematical analysis, Turnover time, Cobalt radioisotopes, *Microorganisms, Path of pollutants, Biotic components, Freshwater environment, Gammarus fasciatus, Nitzschia palea, Celtis occidentalis.

Radiocobalt was used to study the cobalt cycle in aquatic microcosms consisting of five possible compartments. All combinations of lake water, sand, amphipods (Gammarus fasciatus), microflora (Nitzschia palea), and detritus (leaves of Celtis occidentalis) were linked in two, three, four, and five compartment microcosms. The movement of cobalt between water and amphipod, microflora, and detritus compartments was characterized by a set of first order differential equations, while the movement between water and sand compartments was characterized by a partial differential equation due to the slow diffusion of cobalt into the underlying layers of the sand compartment. Cobalt movement in freshwater systems is significantly controlled by the sediment acting as a cobalt sink. Biotic components are capable of turning over cobalt and, in most cases, these turnover rates increase as the number of biotic components increases. Resistance of aquatic systems to perturbation and resilience after perturbation may be found to increase with complexity using certain indices; however, other stability indices show no correlation with system complexity using certain indices; however, other stability indices show no correlation with system complexity. This variable correlation between complexity and stability agrees with other recent ecosystems studies reported in the literature. (Sinha-OEIS)

GROUND WATER SEEPAGE IN LAKE WASHINGTON AND THE UPPER ST. JOHNS RIVER BASIN, FLORIDA,

New Hampshire Water Supply and Pollution Control Commission, Concord.
J. N. Connor, and T. V. Belanger.
Water Resources Bulletin, Vol 17, No 5, p 799-805, October, 1981. 7 Fig, 6 Tab, 11 Ref.

Descriptors: *Seepage, *Drainage effects, *Chlorides, *Fate of pollutants, Lake Washington, St. Johns River. *Florida, Lakes, Groundwater movement, Water quality, Hydrologic budget, Drainage canals, Aquifers.

Direct groundwater seepage measurements in St. Johns River and Lake Washington, Florida, showed that drainage canals entering the lake had high average seepage rates (17.7 liters per sq m per day). Seepage from the lake shores was 2.01 liters per sq m per day. Total inputs into the lake were: St. Johns River, 88.3%; canal discharge, 5.9%; precipitation, 5.1%; and groundwater seepage, 0.7%. Outputs were: St. Johns River, 92.5%; evaporation and evapotranspiration, 4.6%; treatment plant pumpage, 1.9%; groundwater recharge, 0.6%; and marsh storage, 0.4%. Although the drainage canals represented 6.6% of St. Johns River annual discharge, the canals contributed 20.4% of the annual river chloride loading. Chloride contributions were highest during the dry season. Midlake Cl levels were 71 mg per liter; canal water levels, 108-131 mg per liter. Lake seepage water contained 72 mg per liter Cl; and canal seepage water, 215 mg per liter. This study indicated that rising levels of Cl in the river through the years are attributable to groundwater seepage in the headwaters, which have been subjected to channelization, marsh drainage, and diking. PROBABILISTIC MODEL OF LONG-TERM FLUCTUATIONS ON THE LEVEL OF AN OPEN LAKE,

Akademiya Nauk SSSR, Borok. Inst. Biologii Vnutrennykh Vod.
A. V. Frolov.
Water Resources, Vol 8, No 1, p 1-12, January/February, 1981. 4 Fig, 2 Tab, 32 Ref. Translated from Vodnye Resursy, No 1, p 34-47, January/February, 1981.

Descriptors: *Water level fluctuations, Streamflow, *Lakes, Evaporation, Open lakes, *Surface runoff, *Model studies, Lake Ladoga, Neva River, *USSR, Water budget, Rivers.

A model is presented for long-term fluctuations in levels of humid zone open lakes, where the surface runoff far exceeds other discharges in the water balance. In lakes of this type, evaporation and surface area are of minor importance. Results showed that open lakes normalize level fluctuations more weakly than closed lakes. The lake level and outflow are described by second-order autoregression processes. The model was used on data for Lake Ladoga and the Neva River. There was good agreement between observed and calculated water levels. (Cassar-FRC)

As part of long-term studies to preserve the water quality of Lake Creteil, France, interdisciplinary studies were conducted to uncover the origin, path and history of the waters. Isotopic studies of dissolved sulfate have allowed for the improvement of the hydrogeological model of the Creteil plain by identifying two sources of its water and their mineral content. The first source is an interstitial water or a confined low-conductivity aquifer with high sulfate concentrations. Sulfate from this source has a heavier isotopic composition, possibly through reduction, and may have originated in Paris gypsum. These waters are found to the west of Mt. Mesly down to the piezometric level. The second source consists of waters of low salinity and isotopic light sulfate from oxidation of sulfides or fertilizers. These waters are found down the Bois de la Grange Plateau. It is recommended that isotopic data be used in conjunction with other measurements to prevent false assumptions about the origin and characteristics of natural waters. (Geiger-FRC)

ORTHOPHOSPHATE AND ITS FLUX IN LAKE WATERS,

Department of Scientific and Industrial Research, Taupo (New Zealand). Freshwater Section.
E. White, G. Payne, S. Pickmere, and F. R. Picks.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 38, No 10, p 1215-1219, October, 1981. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Lakes, *Phosphates, *Radioactive tracers, *Chromatography, Nutrients, *Orthophosphates, Phosphorus, Particulate matter, Molybdenum, Separation techniques, Tracers, Dissolved solids, *New Zealand.

The relative distribution of reactive high molecular weight phosphorus (RHMW-P) and low molecular weight phosphorus (PO-P) in lake waters as well as the turnover times and presumed flux of phosphate between solution and particulate matter were studied in several New Zealand lakes by molybdenum blue technology and Sephadex gel (G25-150) chromatography. PO4-P is as near to representing orthophosphate as is possible to attain using molybdenum blue technology. Results showed that RHMW-P was not usually the dominant component of dissolved reactive phosphorus and was not solely responsible for incorrect calculations of orthophosphate levels estimated by molybdenum blue and radiotracer technology. Orthophosphate concentrations may be miscalculated when chemically reactive organic phosphorus is present in low molecular weight material (PO-P) and when radiotracer estimates are used. When radioactive PO4-derived turnover times are used to estimate changes in orthophosphate concentrations from solution to particulate matter, errors are likely to occur regardless of the method used to calculate orthophosphate levels. A NOTE ON THE DEVELOPMENT OF THE THERMOCLINE IN TEMPERATE LAKES,

Indiana Univ.-Purdue Univ. at Indianapolis. Dept. of Geology.
P. De Caprariis.
Ecological Modelling, Vol 12, No 4, p 213-219, May, 1981. 1 Fig, 9 Ref.

Descriptors: *Lakes, *Mathematical models, *Thermocline, *Temperature gradient, Mathematical studies, Model studies, Mathematical equations, Thermal stratification, Epilimnion, Hypolimnion, Wind, Turbulent flow.

The Sundaram and Rehem model of the development of thermocline in temperate lakes allow vertical heat flux to vary with depth and is based on a balance between thermal buoyant forces and wind induced turbulence. An exact solution to the governing equation set forth by the Sundaram and Rehm model is presented for one assumption about the form of thermal diffusivity. The solution is presented as a transcendental relation between the temperature gradient and water depth, and the development of the thermocline is associated with a singular point of the governing equation. The exact solution shows the qualitative features of the numerical solution, and it may be used by modelers to obtain variations in temperature gradient with depth when a data set for a lake is deficient. The equations may also be manipulated to estimate the depth of the thermocline directly. (Geiger-FRC)

IRON OXIDE FROM A SEASONALLY ANOXIC LAKE,

Freshwater Biological Association, Ambleside (England).
E. Tipping, C. Woof, and D. Cooke.
Geochimica et Cosmochimica Acta, Vol 45, No 9, p 1411-1419, September, 1981. 4 Fig, 1 Tab, 35 Ref.

Descriptors: *Iron oxides, *Particulate matter, *Sedimentation, Metals, *Lakes, Iron compounds, Oxidation, Stratification, Thermal stratification, Chemical reactions, Esthwaite water, Adsorption, Flocculation, Lake sediments, Humic acids, Organic matter, *United Kingdom.

Ferric oxide particles taken from Esthwaite Water, United Kingdom, during the thermal stratification period and accompanying deep water anoxia are amorphous, spherical to ellipsoidal, with diameters 0.05 to 0.5 microns. They occur at levels of 3 mg Fe per liter or about 400 billion particles per liter. The iron oxide particles apparently do not consist of aggregates of primary particles, probably because they form slowly at low supersaturation. The particles are formed by oxidation of Fe(2+) in water and sediments. The role of bacteria in formation of these particles cannot be clearly defined. The chemical analysis of 4 samples showed 32-39% Fe, 14-18 C, 4-7% humic C, 1.5% N, 0.3-1.4% Mn, and 1-3% P with 1% or less each of Ca, Mg, Si, and S. The iron oxide particles are negatively charged because of adsorbed humic matter, phosphate, and silicate. The electrophoretic mobility in lake water (pH 6.7) is -1.3 times 10 to the minus 8th power sq meters per V per sec at 10 C, similar to pure iron oxide samples in lake water. A zeta potential of -27mV accounts for the high degree of dispersion of particles in the water. Adjusting the pH to < 5.5 (zeta potential < 20 mV) produces rapid flocculation. The observed peak of particulate iron at maximum deep water anoxic conditions is a result of ferrous oxidation exceeding ferric oxide sedimentation and reduction of sedimenting oxide. (Cassar-FRC)

NEUSIEDLERSEE: A PUZZLE FOR SCIENTISTS, A CHALLENGE FOR PLANNERS,

Vienna Univ. (Austria). Zoologisches Inst.
H. Loffler.
Nature and Resources, Vol 17, No 3, p 10-14, July-September, 1981. 4 Fig, 2 Tab.

Descriptors: *Nutrients, *Saline lakes, *Aquatic plants, *Neusiedlersee, Austria, Hungary, Lakes, Recreation, Wildlife, Eutrophication, Water level fluctuations, Water management, Water budget, Water pollution effects.

The Neusiedlersee, a large shallow (1.3 m average depth) lake on the Austria-Hungary border, presents problems for planners and managers. The lake level fluctuates widely. Reeds cover vast areas of water. The water budget, which varies with the climate, has not been clearly defined. Water entering the northern and western part of the lake is alkaline; water entering the southern part is saline. Anthropogenic influences (recreation, nutrient input, and commerical fishing) threaten the shoreline, water quality, and wildlife. In 1980 an Austrian-Hungarian commission was established to manage the lake. Limnologists and managers need much more information on this unusual lake: extent of the catchment area, water and salt budgets, tectonic origin of the lake, seiches, movements of the sediments, and the nutrient dynamics of the reed belt. (Cassar-FRC)

FAUNAL ASSEMBLAGES OF SOME SALINE LAKES NEAR MARCHAGEE, WESTERN AUSTRALIA,

Western Australia Univ., Nedlands. Dept. of Surgery.
S. A. Halse.
Australian Journal of Marine and Freshwater Research, Vol 32, No 1, p 133-142, 1981. 1 Fig, 3 Tab, 27 Ref.

Descriptors: *Saline lakes, *Invertebrates, *Salt tolerance, Lakes, *Australia, *Fauna, Benthic fauna, Aquatic fauna, Fish, Species distribution, Species diversity, Ecological effects, Fish populations, Copepods, Amphipods.

Fauna in five saline lakes in western Australia were sampled 1 to 4 times during the period March to September 1979, an exceptionally dry year. These lakes ranged from 4 to 650 ha in surface area, 0.15 to 1.3 meters in maximum depth, and 10 to 71 o/oo in salinity. The four more saline lakes had similar faunal assemblages consisting of 6 to 8 species. The most weakly saline lake had 13 species (5 crustaceans and 8 insects). Fish (Pseudogobius olorum) were found only in one lake (salinity 55 o/oo). Copepods and occasionally cladocerans were dominant. Only the amphipod Austrochiltonia subtenuis and the dytiscid Necterosoma pensillatus were present in all five lakes. This study discovered that several species were living at greater salinities than was previously known: A. subtenuis at 71 o/oo (previous record 44 o/oo) and Mytilocypris mutiloides at 45 o/oo salinity (previous record, about 10 o/oo). N. pensillatus was found at generally lower salinities than in eastern Australia, and at a record low of 10.5 o/oo for the species. (Cassar-FRC)

ENVIRONMENTAL FACTORS AFFECTING THE GROWTH OF PHOTOSYNTHETIC BACTERIA IN LAKES,

Wisconsin Univ.-Madison.
T. B. Parkin.
PhD Thesis, August, 1980. 360 p, 22 Fig, 7 Tab, 164 Ref, 5 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-28198.

Descriptors: *Environmental effects, *Aquatic habitats, *Lakes, *Light intensity, *Photosynthetic bacteria, Hydrogen sulfide, Light penetration, Light quality, Color, *Primary productivity.

Photosynthetic bacteria are found in a wide variety of aquatic habitats. In the water columns of lakes, purple and green sulfur bacteria can develop large population densities at the depth where two key

requirements for growth, light and hydrogen sulfide, are present. This study was designed to investigate the effects of light and hydrogen sulfide on the activities of photosynthetic bacteria in lakes. It was found that the color of light penetrating to the sulfide-containing waters in lakes has a major role in determining which types of phototrophs develop. In one lake, red light penetrated to the greatest depth and only green sulfur bacteria capable of using red light were present. In the other lakes, primarily green light penetrated to the sulfide-containing waters and the carotenoid-rich purple bacteria capable of using these wavelengths of light predominated. The effects of light intensity were determined by evaluating the extent to which primary production by the photosynthetic bacteria in seven lakes was influenced by light intensity. A high correlation between primary production by these organisms and light intensity was observed. Production by these organisms did not correlate with either standing crop or sulfide concentration. The study of the effects of sulfide was confined to the bacterial population of a single lake. Rates of sulfide turnover at the thermocline region were estimated by monitoring sulfide oxidation and sulfate reduction rates. Also, the effects of sulfide concentration on photosynthesis and the relationships between sulfide oxidation and carbon fixation rates by this population were elucidated. (Sinha-OEIS)

SULFATE REDUCTION IN THE SEDIMENTS OF A EUTROPHIC LAKE,

Michigan State Univ., East Lansing. Dept. of Microbiology.
R. L. Smith.
PhD Thesis, 1981. 142 p, 19 Fig, 11 Tab, 150 Ref.
University Microfilms International, Ann Arbor, MI; Order No GAX81-26554.

Descriptors: *Sediments, *Eutrophic lakes, *Bacteria, *Sulfates, Carbon cycle, Lake sediments, Sulfate-reducing bacteria, *Sulfate reduction.

This study has demonstrated that high rates of sulfate reduction occur in the sediments of eutrophic lakes despite low interstitial sulfate concentrations. Although profiles of organic sulfur and hydrogen sulfide concentrations suggest otherwise, dissimilatory sulfate reduction appears to be the major mechanism of hydrogen sulfate production. Sulfate-reducing bacteria isolated from these sediments can utilize a wide array of substrates for carbon and/or electron donors; substrates that are typically found in eutrophic sediments. Mineralization experiments in the presence and absence of an inhibitor of sulfate reduction also indicate that sulfate reducers utilize an array of substrates as electron donors and are of potential significance to the in situ mineralization of lactate, propionate, and free amino acids. Based on these results a scheme conceptualizing sulfate reduction in anoxic sediments as it relates to carbon flow is given. The figure demonstrates that sulfate-reducing bacteria can be involved with each major step of oxidative carbon metabolism; the magnitude of the involvement is dependent primarily upon the sulfate concentration available. Ample evidence indicates that when the sulfate concentration is sufficient sulfate reduction mediates carbon flow. (Sinha-OEIS)

2I. Water In Plants

A FIELD STUDY WITH NITROGEN-15 OF SOIL AND FERTILIZER NITRATE UPTAKE AND OF WATER WITHDRAWAL BY SPRING WHEAT,

Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hanover (Germany, F.R.).
O. Strebel, H. Grimme, and H. Fleige.
Soil Science, Vol 130, No 4, p 205-210, October, 1980. 4 Fig, 1 Tab, 13 Ref.

Descriptors: *Soil water, *Nitrogen, *Wheat, *Uptake, *Soil-water-plant relationships, Nutrients, Nitrates, Cycling nutrients, Fertilizers, Field tests, Crop production, Plant water potential, Loess, Soil solution, *West Germany.

The uptake of nitrate and water by spring wheat as a function of soil depth and time was studied in field tests on a Parabraunerde (Udalf) soil of West Germany, formed from loess. Radioactively-labeled nitrogen fertilizer was applied three times before sowing, and nitrate levels in the soil solution, soil water content, and soil water suction were determined by suction probes, a neutron meter and tensiometers, respectively. Total vertical water flow, capillary water flow, root water flow, labeled fertilizer, total soil nitrate levels and apparent mass flow of nitrate to roots were calculated and compared to nigrogen uptake at four harvests taken at the first node stage, anthesis, milk stage and maturity. Total uptake of nitrogen at the four harvest stages was 85, 134, 164, and 197 kilograms/hectare, of which 82, 71, 57, and 50% respectively were derived from the labeled fertilizer. The arable layer provided 76% of the total nitrogen uptake by mass flow and 62% of the total water uptake. The low contribution of mass flow to nitrogen supply was attributed to relatively low nitrate concentrations and a favorable water regime. (Geiger-FRC)

DROUGHT RESISTANCE OF SORGHUM BICOLOR L. MOENCH. 3. SEED GERMINATION UNDER OSMOTIC STRESS,

Saskatchewan Univ., Saskatoon. Dept. of Crop Science.
D. G. Stout, G. M. Simpson, and D. M. Flotre.
Canadian Journal of Plant Science, Vol 60, No 1, p 13-24, January, 1980. 8 Fig, 4 Tab, 21 Ref.

Descriptors: *Drought resistance, *Osmotic pressure, *Germination, Salt balance, Seeds, Growth rates, *Sorghum, Drought, Soil-water-plant relationships.

An in-depth study was conducted of the germination characteristics of two sorghum cultivars previously shown to have different germination characteristics. Since plant hormones are believed to affect drought response of seedlings and adult plants, the effect of plant hormones on seed germination under different osmotic conditions was also examined. The germination responses of the two cultivars were also compared in soil and in different osmotic solutions. The findings support the earlier report that cultivar NK300 has better germination ability than the cultivar M35 under conditions of osmotic stress. These findings demonstrate a genuine difference in seed germination under drought stress. The osmotic solutions (D-mannitol, sucrose and polyethylene glycols) had little effect on the total amount of water taken up by sorghum seeds. The slight reduction in water uptake of seeds exposed to osmotica, compared to seeds exposed to water, may be related to the osmotica inhibiting cell wall expansion. NK300 seeds germinated better than M35 seeds at low water potential. Osmotic stress inhibition of germination is not due to decreased water uptake but instead appears to be due to an inhibition of metabolism in cells which have sufficient turgor potential to permit cell expansion. 2J. Erosion and Sedimentation

SOME SUSPENDED SEDIMENT YIELDS FROM SOUTH ISLAND CATCHMENTS, NEW ZEALAND,

Ministry of Works and Development, Christchurch (New Zealand). Water and Soil Div.
G. A. Griffiths.
Water Resources Bulletin, Vol 17, No 4, p 662-671, August, 1981. 4 Fig, 5 Tab, 38 Ref.

Descriptors: *Suspended sediments, *Precipitation, *New Zealand, South Island, Catchments, Rainfall, Runoff, Mathematical studies, Sedimentation, *Sediment yield.

Instantaneous suspended sediment concentration and water discharge data were collected at 50 sites throughout South Island, New Zealand. Suspended sediment concentration and corresponding water discharge data were plotted on logarithmic paper. Tentative specific annual suspended sediment yield prediction equations were derived for four specific regions of South Island. An absolute error range, together with the factorial standard errors of the yield prediction equations, have been stated so that an appropriate error value may be deduced for the design of sedimentation aspects of engineering works. The yield prediction equations are not applicable to sites located downstream of major sediment storage basins. It is inferred that lakes and reservoirs effect a reduction in sediment yield through attenuation of flood hydrographs, because suspended sediment concentration ratings were observed to recover to their predam or upstream of lake values within tens of kilometers downstream from storage basins. A guide is given for the estimation of bedload yield by assuming it to be a stated proportion of suspended load yield. Rainfall was the most important parameter considered in terms of influence on suspended sediment yield production. Intensity, frequency, and duration of storms appear to explain the differences in specific yield production between regions for basins having similar rainfalls. (Baker-FRC)

Descriptors: *River beds, *Bottom sediments, Size distribution, *Particle size, *Amazon River, South America, Brazil, Sediment transport, *Sediment distribution, Sand.

Samples of streambed material collected from the Amazon River and its major tributaries along a reach of the river from Iquitos, Peru, about 3,300 kilometers above Macapa, Brazil, to a point 220 kilometers above Macapa were subjected to particle size analyses. Samples collected with pipe dredges or with a US BM-54 bed material sampler were dried aboard ship and transported to the United States for particle size analysis by sieving or by pipette-visual accumulation tube methods. Sample analyses showed that the bed of the Amazon is mostly fine sand. The Amazon River does not show the trend of decreasing particle size for bed material in the downstream direction which is usually found in alluvial streams. Samples taken at several cross-sections demonstrated that the cross-channel variation in particle size at many locations was at least as great as the downstream variations for the entire 3,300 kilometer distance. While the median particle size and sorting coefficient were essentially constant along the Amazon mainstream reach examined, the composition of the bottom sands in the same reach varied significantly. Sands collected near Iquitos contained a larger proportion of dark mineral grains and rock fragments, indicating a predominantly Andean source. Sands in the lower 2,000 kilometer stretch studied contained higher proportions of zircon and tour-

mafics and fewer unstable minerals, indicating a dilution of the mainstream material by sands brought in by tributaries from the Precambrian shield areas to the north and south of the river. (Carroll-FRC)

MOVEMENT OF BED MATERIAL IN A SMALL REACH OF A PERENNIAL STREAM,

Clark Univ., Worcester, MA. Dept. of Geography.
A. Zahavi.
PhD Thesis, 1981. 184 p, 20 Fig, 16 Tab, 13 Map, 74 Ref, 6 Append. University Microfilm International, Ann Arbor, MI; Order No GAX 81-18828.

Descriptors: *Sediment transport, *Stream discharge, *Bed load, Saltation, Erosion, Sedimentation, Geomorphology, Spatial distribution, Temporal distribution, Discharge capacity, Bedload discharge, New England.

The underlying and fundamental relations determined in this study are presented in the form of general conclusions. The following three general conclusions appear to be highly reliable: (1) Particle movement is an interaction between stream bed macro morphology and the particle physical properties such as the three axes, shape and weight; (2) Movement is related inversely to a particle's three axes and its weight; and (3) The small particles show a smaller mean distance of movement than that which would be expected if the relation of size with movement were continuous for all particles. In New England, generally only smaller bed particles move during the low summer flows. Larger particles would only be moved during the larger flow of the spring snow melt or by the higher magnitude lower frequency events associated with individual severe storms. This study inquires into the relations between the temporal and spatial discharge patterns and how they affect bedload transport within a small New England stream. (Sinha-OEIS)

BEDLOAD TRANSPORT IN AN OREGON COAST RANGE STREAM,

Georgia Pacific Corp., Fort Bragg, CA.
S. J. O'Leary, and R. L. Beschta.
Water Resources Bulletin, Vol 17, No 5, p 886-894, October, 1981. 9 Fig, 23 Ref.

Descriptors: *Bed load, *Sediment sampler, *Sediment transport, *Flynn Creek, *Oregon, Coastal streams, Streambeds, Streamflow, Sampling.

Two types of sediment samplers (vortex tube and Helley-Smith pressure differential) were used to measure bedload transport for three major storms at Flynn Creek, Oregon. The vortex tube was inefficient in trapping particles < 10 mm in diameter. After adjusting transport rates for this deficiency, results were still only 42-47% of those obtained with the Helley-Smith sampler. Problems with plugging in the Helley-Smith 0.2 mm mesh bag were partially overcome by increasing the bag size threefold and reducing the sampling time to less than 15 sec. Generally, bedload transport increased with increased streamflow. There were large and rapid fluctuations in bedload transport rates even during times of constant streamflow. Some of the possible reasons for the nonuniform sediment transport are: (1) nonuniform channel geometry (pool and riffle), (2) nonuniform particle size, and (3) transient flows in response to precipitation. SEDIMENT TRANSPORT BY RAINSPLASH,

Washington Univ., Seattle.
C. J. McCarthy.
PhD Thesis, February, 1980, 228 p, 38 Fig, 2 Tab, 117 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-26269.

Descriptors: *Rainfall impact, *Model studies, *Sediment transport, Slopes, Erosion, Particle size, Rainsplash, Single-drop transport law, Sediment size, Raindrop size.

A model is presented of sediment transport by rainsplash which contains substantial improvements over previous models. The model represents the sediment transport by rainstorms as the sum of the transport of the constituent drops. The dynamics of splashing are modeled qualitatively, and the results used to suggest the form of an empirical transport law for single drops. The single-drop transport law is obtained from analysis of data from detailed observations of rainsplash transport. The model connects the single-drop law with rainfall possessing any drop-size distribution, and is unique in its ability to predict rainsplash transport for any rainfall conditions and under a wide range of sediment sizes and slope angles. Hillslope evolution is modeled using the rainsplash transport law. The situations modeled include an isolated ridge, a weak layer between resistant layers, and the effects of changing base level. This is the first study to model hillslope evolution using a realistic transport law developed for a specific process. (Sinha-OEIS)

FACTORS AND MECHANICS OF BLUFF EROSION ON WISCONSIN'S GREAT LAKES SHORELINES,

Wisconsin Univ.-Madison.
R. J. Sterrett.
PhD Thesis, May, 1980. 390 p, 45 Fig, 14 Tab, 53 Ref, 7 Photo, 13 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-20581.

Descriptors: Erosion, *Erosion rates, Groundwater, Water table fluctuations, Groundwater movement, Slope stability, Solifluction, Rill erosion, Creep, *Shores, *Great Lakes, *Wisconsin, Shoreline recession, *Bluff erosion.

The principal objectives of this study were to quantify the rates of erosion and removal of material from the slope by the processes of sheetwash and rill erosion, slumps, and solifluction. The field investigations were conducted at eight sites on Wisconsin's Great Lakes shorelines. The influence of ground water on slope stability was also investigated. This investigation included defining groundwater gradients, position, and water-level fluctuations within the bluffs. The results of the study indicate that most soil loss occurs during the spring thaw. Up to 96% of all soil lost from a bluff face can occur in the spring as the result of slab slides and mudflows. Large rotational slumps are infrequent in occurrence and contribute only a small percentage of material lost. Sheetwash and rill erosion were found to be effective processes in removing material from the bare soil bluff faces. Ground water is an important factor which is significant in understanding slope stability. Field and computer studies showed that there are two minimally interconnected flow systems operating at several sites on Lake Michigan. One system is within the fractured till at the top of the bluff, and the second is within a sand lens. Water-level fluctuations within the upper fractured till are important in overall stability. Water-table fluctuations along one stretch of Lake Michigan's shoreline appear to be the triggering mechanisms for a 10-meter bluff top recession which occurred in six months. (Sinha-OEIS)

HYDROCHEMICAL BALANCE OF AN ALPINE WATERSHED IN SOUTHEAST ALASKA,

Tongass National Forest, Ketchikan, AK.
J. D. Stednick.
Arctic and Alpine Research, Vol 13, No 4, p 431-438, November, 1981. 1 Fig, 4 Tab, 21 Ref.

Descriptors: *Water quality, *Alpine regions, *Chemical composition, Watersheds, *Indian River, *Alaska, Weathering, Minerals, Precipitation, Streams, Surface water.

The water quality balance of Upper Indian River, Chicagof Island, Alaska was investigated during 1979 and 1980. The 8 sq km watershed had an average streamflow of 2825 mm and annual precipitation of 3300 mm. There were net increases in orthophosphate (0.4 kg per ha per year) and in sodium (1.4 kg per ha per year). There were losses (expressed in kg per ha per year) in total nitrogen, 5.9; mg, 5.1; Ca, 475.5; silica, 55.2; sulfur, 36.+5; chloride, 71.3; and potassium, 12.4. Total phosphorus output equaled precipitation input. The major sources of most elements were weathering of rocks and deposition of ocean salts with precipitation. (Cassar-FRC)

WATER CHEMISTRY OF ALABAMA PONDS,

Auburn Univ., AL.
R. G. Arce.
PhD Thesis, June, 1980. 47 P, 20 Fig, 9 Tab, 23 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-18173.

Descriptors: *Water analysis, *Chemical analysis, *Ponds, Soil water, Hardness, Alkalinity, Chemical properties, Watershed management, Fish ponds, *Environmental effects, *Alabama.

Waters from Alabama fish ponds from five soils areas were dilute solutions of alkaline earth carbonates and bicarbonates. Waters also contained low concentrations of sodium, potassium, chloride, and sulfate and trace quantities of iron, manganese, zinc, and copper. Nitrogen and phosphorus concentrations were not measured. The total concentration of ions (averages) by soils area were in the following order: Piedmont Plateau to Coastal Plains to Appalachian Plateau to Limestone Valley and Uplands to Prairies. Differences in total ionic concentrations resulted primarily from differences in carbonate and bicarbonate (total alkalinity) and calcium and magnesium (total hardness) concentrations. Waters of a particular soils area often differed considerably in concentration of all variables, resulting in skewed distributions of data. Therefore, data are presented in histograms for each chemical species and each soils area. Means and standard errors are also presented. Many relationships existed between ions, but few were strong enough to be useful in predicting ionic concentrations. The most useful relationship involves the use of the sum of total hardness and total alkalinity to estimate total ionic concentrations. Watershed management practices did not greatly affect concentrations of major ions, but ponds in woods often had organically stained water, those in pastures often had plankton blooms, and the ones filled by runoff from watershed planted to row crops were often turbid with suspended soil particles. Descriptors: *Minerals, *Groundwater, *Chemical properties, *Seepage, *Tropic zone, Drainage, Surface drainage, Hydrogen ion concentration, Soil profiles, Soil science, Spring water, Runoff, Rainfall, Physicochemical properties, Organic carbon, Cations, Anions, *West Africa.

During four to eleven years of field studies, 5,000 samples of rainfall, throughfall, runoff, drainage, and groundwater were examined as part of a research program on the dynamics of the ferralitic and ferruginous soils of West Africa. All of the water samples analyzed were slightly mineralized, with increasing mineralization from rainfall water to seepage water at 2 m depth. The mineral content generally decreased at the water table level except for Si and Na content. The amounts of dissolved solids varied markedly with flow volumes and seasons. The factors governing the chemical composition of the groundwaters were very complex. The composition of water in the soil layers was affected basically by biological and biochemical processes, while that of the groundwaters was dependent mainly upon physicochemical properties. NATURAL TEMPORAL VARIATIONS IN THE CHEMISTRY OF SHALLOW GROUNDWATER, ATHABASCA OIL SANDS AREA, ALBERTA,

Stanley Associates Engineering Ltd., Edmonton (Alberta),
D. A. Hackbarth.
Canadian Journal of Earth Sciences, Vol 18, No 10, p 1599-1608, October, 1981. 6 Fig, 2 Tab, 24 Ref.

Descriptors: *Seasonal variation, *Water quality, *Groundwater level, *Gochemistry, Chemical composition, Athabasca Oil Sands, *Alberta, Calcium, Magnesium, Bicarbonates, Sulfates, Chlorides, Solutes, Sodium, Potassium, Carbonates, Nitrates, Silica, Water table fluctuations, Shallow wells, Groundwater recharge, Recharge.

The chemistry of shallow groundwater in the Athabasca oil sands area, Alberta, showed annual variations during sampling conducted from 1977-1979. Three wells, 5 to 8 m deep, were located in an area with 99% natural vegetation within 30 miles of oil sands mining developments. Coefficients of variation were highest for nitrates, 100-132%, and for all parameters averaged 34% for the well sampled monthly and 11 and 21% for the two wells sampled bimonthly. The annual pattern of variation in chemistry of the shallow groundwater was related to the level of the water table. Calcium, magnesium, and bicarbonate concentration were lowest in spring, highest in summer. This is related to the carbon dioxide in the recharge water, controlled by the muskeg. Sulfates were highest in spring and fall, during periods of significant groundwater recharge. Chloride concentrations were highest in winter, lowest in spring and summer, reflecting the slower groundwater flow in winter and greater residence time in the chloride-bearing minerals. Water chemistry varied less at wells of greater depth. Coefficient of variation at 150 m was 4%. (Cassar-FRC)

IDENTIFICATION OF CONNATE WATER IN INTERSTITIAL SOLUTION OF CHALK SEDIMENT,

Institute of Geological Sciences, Wallingford (England).
A. H. Bath, and W. M. Edmunds.
Geochimica et Cosmochimica Acta, Vol 45, No 9, p 1449-1461, September, 1981. 7 Fig, 4 Tab, 21 Ref.

Descriptors: *Connate water, *Geochemistry, *Groundwater dating, Chemical composition, Solute transport, Interstitial water, Pore water, Meteoric water, *Chalk formation, Isotope studies, Dating, Carbonate aquifers, Diagenesis, Geohydrology, Diffusion model.

The interstitial solution chemistry of core samples from a 594 meter borehole (41 m of glacial deposit, 472 m of carbonate) in the Upper Cretaceous Chalk formation near Norfolk, England, was investigated. In general, dissolved species (chloride, Na+, K+, Ca(2+), Mg(2+), bromide, sulfate, and Li+) were most dilute near the surface and increased in concentration with depth to a near-marine composition. Sr(2+) and fluoride concentrations decreased up to 100-200 meters depth and showed anomalous behavior at greater depths. O18 and D values for interstitial water became less negative with increasing depth and were correlated with the changes in salinity. The observed pattern of increasing salinity with depth suggests that meteoric water has diluted the interstitial water. The deepest water is connate, subsequently modified by diagenetic reaction. The same ratio of Na+:Cl- is maintained throughout the entire profile. Departures from the expected dilution trend (K+, Sr+, Li+, and fluoride) are probably a result of diagenetic reactions during burial or a result of freshwater circulation following uplift of the sediments. Analysis of the Chalk itself showed a general uniformity of Mg and Sr, despite a wide variation in interstitial solution compositions, suggesting that there was no general recrystallization of the carbonates. A diffusion model was applied to the dilution of the connate interstitial solution. The beginning of mixing [illegible]as calculated at 3 million years age (late Tertiary). The discrepancy between stable isotope composition and chemical composition of interstitial solutions can be attributed to different diffusion rates of the water and solute species. (Cassar-FRC)

Descriptors: *Aquifers, *Sulfides, Chemical composition, Groundwater, *Florida, *Texas, Hydrogen sulfide, Edwards aquifer, Floridan aquifer, *Carbonate aquifers.

Evidence is presented on the co-existing and simultaneously collected reduced sulfur species in a Florida aquifer. The total sulfur values of dissolved sulfide and the sulfur isotope fractionations between dissolved sulfide and sulfate species in the groundwater generally correlated with dissolved sulfate concentrations, which were related to flow patterns and residence time within the aquifer. The dissolved sulfide derives from the slow in situ biogenic reduction of sulfate dissolved from sedimentary gypsum in the aquifer. Where the water is the oldest, the dissolved sulfide apparently had attained isotopic equilibrium with the dissolved sulfate at the temperature of the system, which was 28 degrees C. This approach to equilibrium reflects an extremely slow reduction rate of the dissolved sulfate by bacteria. This slow rate probably results from very low concentrations of organic matter in the aquifer. In the reducing part of the Edwards aquifer, located in Texas, there was a general down-gradient increase in both dissolved sulfide and sulfate concentrations, but neither the total sulfur values of sulfide nor the sulfide-sulfate isotope fractionation correlated with the groundwater flow pattern. The dissolved sulfide species appeared to be derived mainly from biogenic reduction of sulfate ions, whose source is gypsum dissolution, even though upgradient diffusion of hydrogen sulfide gas from deeper oil field brines may be significant in some places. THE INFLUENCE OF PERIPHERAL SABKHAS ON THE GEOCHEMISTRY AND SEDIMENTOLOGY OF A TUNISIAN LAGOON: BAHIRET EL BIBAN,

K. Medhioub, and J. P. Perthuisot.
Sedimentology, Vol 28, No 5, p 679-688, October, 1981. 13 Fig, 2 Tab, 10 Ref.

Descriptors: Evaporation, *Saline water, *Tidal flats, Arid lands, *Geochemistry, Calcium sulfate, *Sedimentology, Chemical composition, Water circulation, *Lagoons, Sabkhas, Bahiret el Biban, *Tunisia.

Bahiret el Biban, a limited-circulation lagoon on the Tunisian coast, is separated from the Mediterranean by a narrow barrier broken by an inlet. On the inland border of the lagoon are sabkhas, or wide tidal flats now 0-2 m above sea level, which were formed from marine sediments. The chemical behavior of the lagoon was studied March 1976-August 1977. Water is more saline at greater distances from the seawater inlets. Salinity is higher in summer, when evaporation is greater than in winter, when freshwater dilution can take place. Water was more saline in 1977 than in 1976. Bottom waters are more concentrated than surface waters. Calcium sulfate is gradually lost, mostly by evaporitic evolution and sulfate reduction in the adjacent sabkhas. Here the interstitial waters are high in dissolved solids. This lagoon is a possible example of the early stages in evolution of an evaporatic basin. (Cassar-FRC)

SOLUBILITIES OF GYPSUM AND HALITE IN THE DEAD SEA AND IN ITS MIXTURES WITH SEAWATER,

Hebrew Univ., Jerusalem (Israel). Dept. of Geology.
A. Katz, A. Starinsky, N. Taitel-Goldman, and M. Beyth.
Limnology and Oceanography, Vol 26, No 4, p 709-716, July, 1981. 2 Fig, 5 Tab, 19 Ref.

Descriptors: *Saline lakes, *Saturation, *Solubility, Chemical precipitation, Lakes, Salts, Saline water, Gypsum, Calcium sulfate, Halite, Sodium chloride, Brines, *Dead Sea, Israel, Seawater.

The entire Dead Sea water column (ionic strength = 9-10) is saturated or slightly oversaturated with respect to both gypsum (CaSO4.2H2O) and halite (NaCl). This was determined by chemical analysis of mixtures of Mediterranean seawater (ionic strength = 0.8) and Dead Sea brines (ionic strength = 9) over the ionic strength range of 3 to 13. Higher ionic strength solutions were produced by evaporation. The practical solubility constants of gypsum were found to be related to the ionic strength by an empirical expression. The average degree of saturation for gypsum was 1.16 (range 1.08-1.43); for halite, 0.95-1.17. Summer temperatures are expected to decrease the gypsum saturation values in the upper 30 meters of water (at

ambient temperatures, 1.22-1.43) by 10-15%. (Cassar-FRC)

ANALYSES OF TEMPORAL CHANGES IN FISH ASSEMBLAGES IN SERPENTINE CREEK, QUEENSLAND,

Queensland Univ. Brisbane (Australia). Dept. of Zoology.
N. J. Quinn.
Environmental Biology of Fishes, Vol 5 No 2, p 117-133, April 22, 1980. 14 Fig, 4 Tab, 62 Ref.

Descriptors: *Fish populations, *Species diversity, *Seasonal variation, Estuaries, Bramble Bay, Serpentine Creek, *Australia, Temperature, Salinity, Biological communities, Time series analysis.

Nocturnal fish populations at 10 sites in Serpentine Creek and Bramble Bay, near Brisbane, Australia, were surveyed every two weeks from November 1975 to April 1977. Forty-five species from 34 families (14,518 individuals) were obtained. The six most abundant species accounted for 72% of the catch. Creek salinities and temperatures followed an annual cycle, which proceeded the bay by 1 month. Minimum salinity was found in February, and maximum temperature in January. The mean number of species and abundance of all fish conformed to a regular annual pattern, with maxima in April and May. Shannon and Gleason diversity indices showed no regular seasonal trends. Of the twenty-two most abundant species, seventeen demonstrated a regular annual cycle of abundance. Number, abundance, and diversity were greatest about 1 km upstream from the creek mouth and gradually declined upstream. Temperature and/or salinity were positively correlated with the abundance of 11 species. Fish were classified into 5 groups: resident (only Spheroides pleurostictus), transient (infrequent, sporadic), annual (possibly tolerant to variable abiotic conditions), abiotically influenced species (dependent on salinity/temperature), and seasonal (related both to abiotic values and to an annual cycle). The low proportion of resident species is consistent with Tyler's (1971) theory that temperature instability is reflected in instability in assemblages of fish species. (Cassar-FRC)

ON THE CONSPECIFICITY OF MARINE AND FRESHWATER BANGIA IN BRITAIN,

Liverpool Univ. (England). Hartley Botanical Labs.
R. H. Reed.
British Phycological Journal, Vol 15, No 4, p 411-416, December 1, 1980. 1 Fig, 22 Ref.

Descriptors: *Salt tolerance, *Algae, *Bangia, Salinity, Estuaries, Marine plants, *United Kingdom, Aquatic plants.

The salinity responses of marine (Port St. Mary, Isle of Man, United Kingdom) and freshwater (Leeds-Liverpool Canal at Wigan) Bangia isolates were studied in laboratory cultures to test the conspecific theory. After two generations immature germlings of the marine isolate were introduced into waters of varying salinity (natural seawater, freshwater and mixtures), where they grew over the whole salinity range. Growth was optimum in full-strength seawater. The freshwater isolates grew best in 1/16 to 1/2 seawater, and least well in 1/32 and full-strength seawater. Although most mature plants of the marine isolate died when placed in fresh water, a few cells in some thalli survived and formed a bottlebrush structure after 8-10 weeks dormance. These produced new plants, which did not reproduce. This evidence suggests a marine origin for freshwater Bangia and adds weight to the argument that the two are not separate taxa. (Cassar-FRC)

THE EFFECT OF ORGANIC MATERIAL AND INORGANIC IONS ON THE PHOTOSYNTHETIC RATE OF RED ALGA BOSTRYCHIA BINDERI FROM A FLORIDA ESTUARY,

University of South Florida, Tampa. Dept. of Biology.
C. J. Dawes, and R. P. McIntosh.
Marine Biology (Berlin), Vol 64, No 2, p 213-218, September, 1981. 6 Fig, 4 Tab, 24 Ref.

Descriptors: *Algal growth, *Estuaries, *Salinity, Photosynthesis, Nutrients, Sea water, Calcium, Spring water, *Florida.

Comparisons of photosynthetic rates were made on Bostrychia binderi held in seawater diluted to various salinities, artificial spring water, and distilled water to determine which components of spring water may be particularly important to the alga's survival in estuarine waters. The rate of photosynthesis increased with decreases in salinity. Higher photosynthetic rates when salinity was 0 and 5 ppt were partially due to increased levels of bicarbonate and various nutrients. When plants were held for three to seven days in spring water of low salinity (0-5 ppt), the higher calcium levels caused a higher photosynthetic rate. When salinity was 5 ppt or higher, the effect of calcium on the photosynthetic rate was not apparent after 2 to 8 weeks due to acclimation. The diverse algal populations characteristic of estuaries on the west coast of Florida may be due at least in part to natural spring water mixing with the seawater and sustaining the algae over short periods of low salinity. ESTUARINE DISTRIBUTION OF SAPROLEGNIACEAE IN THE TAMPA BAY AREA: I,

University of South Florida, Tampa. Dept. of Biology.
D. Tes. Wagner-Merner.
Botanica Marina, Vol 23, No 11, p 707-709, November, 1980. 2 Tab, 14 Ref.

Descriptors: *Estuaries, *Aquatic fungi, Distribution patterns, *Tampa Bay, Salinity, Nutrients, Growth.

This study attempted to determine what Saprolegniaceae are distributed in a small estuary in the Tampa Bay Area. Bullfrog Creek, the area studied, is located in the heart of the county agricultural district but is subject to minimal agricultural drainage. The collecting of Saprolegniaceae from the estuary was carried out by laboratory or in situ hemp seed baiting techniques. It appeared from the findings of the study that some species of Saprolegniaceae are limited in their occurrence in southeastern estuaries. No evidence was forthcoming that a correlation existed in fungal distribution in a natural aquatic habitat between temperature and salinity tolerance. It is suggested that additional studies are needed on competition among water molds on quantified and equal baits in order to understand estuarine mycology more fully. (Baker-FRC)

Water Research, Vol 14, No 9, p 1327-1332, September, 1980. 2 Fig, 3 Tab, 20 Ref.

Descriptors: *Accumulation, *Heavy metals, *Fish, Metals, *Estuaries, *France, Crustaceans, Bioaccumulation, Copepods, Mysids, Path of pollutants, Food chains, Loire estuary.

Plankton-feeder fish (anchovies, sprats, garfish and herring) and their prey (mainly Copepods and Mysids) were obtained from the banks of Bilho and Pipy in the Loire estuary in August 1977 to October 1978. Trace element (Cd, Pb, Cu and Zn) concentrations in organisms from different levels of the food chains were compared using the transfer factor (the ratio of the concentration in the predator to that in the prey). This factor was generally lower than 1 for Cd, Pb and Cu but often higher than 1 for Zn. This does not conclusively indicate biomagnification of Zn in the food chain, since the level of Zn in the predator used to calculate the transfer factor results from the accumulation of both food and water. The differences observed between the two zoological groups were partly due to the fact that determinations were made after elimination of the digestive content for the fish, while for the crustaceans the digestive content was included. Analysis of the results and literature data indicate that the order of biological accumulation was $\mathrm{Cd} < \mathrm{Pb} = \mathrm{Cu} < \mathrm{Zn}$ in fish and $\mathrm{Cd} < \mathrm{Pb} < \mathrm{Cu} < \mathrm{Zn}$ in crustaceans. The difference was due to the metabolic role of Cu in crustaceans as a constituent of respiratory pigment. During digestion there was often a slight decrease of metal concentrations between the prey and stomach content, followed by an increase of the metal levels in intestinal contents compared to the stomach. DYNAMICS OF BACTERIOPLANKTON IN THE NEWPORT RIVER ESTUARY,

North Carolina State Univ. at Raleigh. Dept. of Marine Science and Engineering.
A. V. Palumbo.
PhD Thesis, 1980. 124 p, 16 Fig, 29 Tab, 107 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-00809.

Descriptors: *Estuaries, *Organic matter, *Bacteria, Plankton, Particulate matter, Dissolved oxygen, Amino acids, Dissolved organic carbon, *Newport River estuary, *North Carolina.

The numbers of the bacterioplankton and the turnover times of dissolved organic compounds in the Newport River estuary are comparable to the numbers and turnover times observed in other studies, especially those done in estuaries. Bacterial populations which occur in the riverine and estuarine areas respond to changes in pH, salinity, temperature and substrate concentration. Resuspension of benthic bacteria does not seem to be the source of the relatively high biomass and activity of the bacterioplankton in the upper estuary. However, release of DOC from the organic rich anaerobic sediments of the upper estuary could be very important. The data supports the hypothesis that the mid-salinity mixing basin above Cross Rock is the primary area of active bacterial growth. There seems to be much less activity and production of bacteria in the river and in the high salinity water of the lower estuary. The maximum bacterial activity and biomass occur during the warmest months and temperature is correlated positively with ADDC, PAV, and negatively with turnover time. The large quantities of DOC in the river do not seem to stimulate bacterial growth until the fresh water mixes with the salt water. The increased pH and perhaps the increased concentration of readily-degradable organic matter released from the shallow anaerobic sediments and from the phytoplankton results in the increase in bacterial numbers and activity in the upper estuarine mixing zone. The data on the respiration of amino acids by natural bacterial populations and the biomass of bacteria in

marine and estuarine waters support the hypothesis that bacteria are an important source of particular organic matter. (Sinha-OEIS)

PHYSICAL MODELING OF ROTTERDAMSE WATERWEG ESTUARY,
Waterloopkundig Lab., Delft (Netherlands). Basic Research Div.
H. N. C. Breusers, and A. G. van OS.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1351-1370, November, 1981. 9 Fig, 13 Ref.

Descriptors: *Model studies, *Estuaries, Estuarine environment, Hydraulics, Mathematical models, Salinity, Sedimentation, Tides, Water quality, Navigation, *Rotterdamse Waterweg estuary, *Holland.

Modeling techniques are considered for the difficult case of the Rotterdamse Waterweg Estuary, where salt intrusion and water quality modeling impose great demands on the capabilities of the techniques employed. A thorough evaluation of the research possibilities of this area indicated that at present only a complementary approach with hydraulic and mathematical modeling is feasible. It was concluded that mathematical models do not yet yield the possibility to predict in sufficient detail the flow velocity and salinity field. Thus the main tool for estuarine problems is the physical scale model. Mathematical models can be used successfully for the study of transport of pollutants and sediments. A hydraulic scale model with a partial black-box character proves to be the most powerful tool for the study of estuaries, provided certain requirements are met. The hydraulic model should be calibrated very carefully, with special emphasis on the influence of possible scale effects due to distortion and Reynolds number influences. The verification tests of the physical model of this estuary proved that reproduction of water levels and flow pattern is possible to the required accuracy if proper boundary conditions are known. Mathematical models are useful in predicting discharges at model boundaries. The model sea boundary should be operated with discharge control. In this case, where wall roughness was dominant, no additional mixing was needed after calibration of the total roughness on the tidal propagation with bed elements. This model has been useful in providing support for management decisions related to the development of the estuary. (Baker-FRC)

HEATED DISCHARGE IN AN ESTUARY: CASE STUDY,
Worcester Polytechnic Inst., Holden, MA. Alden Research Labs.
J. B. Nystrom, G. E. Hecker, and H. C. Moy.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1371-1406, November, 1981. 26 Fig, 1 Tab, 20 Ref.

Descriptors: *Model studies, *Thermal pollution, *Estuaries, Temperature effects, Flow profiles, Heated water, Powerplants, *Nuclear powerplants, Rivers, Estuarine environment, *Hudson River, *Indian Point Nuclear Powerplant.

Two physical model studies were made to evaluate the thermal patterns produced in the Hudson River by the water discharged from the condenser cooling unit from the Indian Point Nuclear Generating Station. Tidal flows dominate the hydraulics of the receiving water body, the Hudson River, which is classed as a partially stratified estuary. Salt from the ocean intrudes into the estuary past the Indian Point site for freshwater flow rates less than about 20,800 cubic feet/second, and relatively strong vertical mixing causes vertical salinity gradients to be relatively weak. Similitude criteria are developed for the design of models to predict near field temperature patterns. These criteria are applied in conjunction with practical considerations. The undistorted near-field model was constructed to a scale of 1-75. Near-field thermal patterns were obtained to evaluate maximum temperature rises, direct recirculation, and to calibrate the distorted scale model outfall structure. The distorted scale model, constructed to a scale of 1-400 and a vertical scale of 1-800, was used to determine thermal patterns in the intermediate-far-field. Typical results show surface temperature rise patterns near the plant discharge and within a 15 mile reach load, and discharge structure geometries are illustrated. Model results are evaluated with respect to scale effects and limitations due to inability to simulate certain phenomena occurring in the field. Model results are compared to an extensive field survey program and a one-dimensional time averaged mathematical model. (Baker-FRC)

DEEP WATER RENEWAL IN SUBARCTIC FJORD,
Woodward-Clyde Consultants, Anchorage, AL.
J. M. Colonell.
Journal of the Waterway, Port, Coastal and Ocean Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WW4, p 223-231, November, 1981. 6 Fig, 2 Tab, 9 Ref.

Descriptors: *Fjords, *Mixing *Water exchange, Subarctic zone, Surface water, Meteorological data collection, Estuaries, *Tidal effects, Tidal currents, Flushing, Current meters, Weather, *Port Valdez, Prince William Sound, *Alaska.

Port Valdez, at the marine terminal of the trans-Alaska Pipeline System, is located on a subarctic fjord. Currents were studied in Valdez Narrows for over 2 years to examine the exchange of water between the port and Prince William Sound. Surges of surface water from Prince William Sound into Port Valdez appear to be related to the passage of weather systems through southcentral Alaska. These events are random and cause variable flushing rates, probably of no more than several days according to outflow volumes recorded on current meter data. These observations suggest that a unique residence time for Port Valdez is inappropriate, but a composite residence time may be estimated at no more than a few weeks. These estimates depend upon assumptions of fairly uniform mixing throughout Port Valdez and should apply to other fjords of southcentral and southeastern Alaska and northern British Columbia. ENRICHMENT OF DISSOLVED PHENOLIC MATERIAL IN THE SURFACE MICROLAYER OF COASTAL WATERS,
Maine Univ. at Orono. Dept. of Oceanography.
D. J. Carlson, and L. M. Mayer.
Nature (London), Vol 286, No 5772, p 482-483, July, 1980. 3 Fig, 40 Ref.

Descriptors: *Estuaries, *Surface water, *Phenols, Bacteria, Microorganisms, Coasts, Enrichment, Dissolved solids, Saco River, *Maine, Damariscotta River, Industrial wastes, Salinity, Chemical properties, Coastal waters.

Ultraviolet absorbance, dissolved organic carbon (DOC), and phenolic material were examined in the bulk and surface microlayer waters of the Damariscotta and Saco River estuaries. The Damariscotta River estuary is a 30 m long, narrow embayment in central Maine with limited freshwater input, predominantly overflow from Damariscotta Lake. The Saco River is a major drainage system in southern Maine. Data from these estuaries demonstrate consistent microlayer enrichment of UV absorbance, and hence of phenolic material. DOC levels did not exhibit consistent enrichment. Most samples plot above the line of equal microlayer partitioning of UV absorbance and DOC. This indicates preferential enrichment of phenoloc material relative to other DOC. While the enrichment of phenolic material occurs at all salinities, it is greatest at higher salinities. This trend may be due to three factors. First, terrigenous humic DOC becomes less soluble at high salinities. Second, higher enrichments at high salinities may simply reflect an aging phenomenon. Third, this may be evidence of different partition coefficients for the two different sources of phenols. The surface microlayer may be temporary sink and a reaction site leading to the resolubilization of strongly UV-absorbing molecules in bulk water or their removal to the atmosphere. (Baker-FRC)

Gigiena i Sanitariia, No 10, p 19-22, October, 1981. 4 Tab, 7 Ref. (English Summary).

Descriptors: *Desalination, *Membranes, *Reverse osmosis, Water pollution effects, Polymers, Materials testing, Plastics, Resins, Evaluation, Water treatment, Drinking water, *Water treatment.

New polyamide membranes composed of phenylone-2s were evaluated for use in water supply systems. The membranes consisted of hollow fibers adhered together with phenol-formaldehyde resin VIAM-B. Under certain conditions, both the phenylone-2s and the phenol-formaldehyde resin may release harmful chemicals into the water, which adversely affect warm-blooded animals and water quality. Such adverse effects were not observed under industrial conditions typical of water desalination by reverse osmosis. In view of these findings both polymers are recommended for use in residential water supply systems.

SALT REMOVAL FROM BRACKISH WATER BY CONTINUOUS PROCESSES WITH AMPHOTERIC, THERMALLY REGENERABLE ION-EXCHANGE RESINS,
Delaware Univ., Newark. Dept. of Chemical Engineering.
T-B. Hsu.
PhD Thesis, June, 1981. 367 p, 95 Fig, 10 Tab, 144 Ref, 9 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-23816.

Descriptors: *Desalination, *Separation techniques, *Resins, *Ion exchange, Adsorption, Brackish water, Computer programs, Continuous flow, Thermal regeneration.

Two amphoteric, thermally regenerable ion-exchange resins, Amberlite XD-2 and Amberlite XD-5, have been utilized to remove salt from brackish water by continuous processes. The physical and chemical properties of both resins have been studied, including their resin capacity, density, poros-

ity, swelling phenomena, etc. The kinetic study of mass transfer in these resins has been carried out by means of frequency analysis during forced temperature cycling and also by fixed-bed breakthrough experiments. Amberlite XD-2 has a higher mass transfer rate than Amberlite XD-5. Both the results of theoretical simulation and the experimental results have been used for the evaluation of a 'Truly Countercurrent, Continuous Adsorption' process to remove salt from water. Amberlite XD-2 showed better separation performance than Amberlite XD-5 under the same operation conditions. The linear-equilibrium-line case, which may be important for dilute concentrations, was also simulated theoretically. The concept of a 'Quasi-countercurrent, Continuous Progressive-zone Adsorption' process has been proposed and studied from a theoretical viewpoint for cases with either linear or non-linear Langmuir equilibrium isotherms. A 'Continuous-flow, Stirred-Tank Reactor' theory and a 'Plug-flow, Fixed-bed Reactor' theory were derived to describe the behavior of this process. The more columns a ACPA process has, the closer it can approach the ideal of truly countercurrent operation. A 4-column QCPA process simulates truly countercurrent operation reasonably well. FROM SCREENING TO FILTRATION: TREATING THE WATER SUPPLY,

New Jersey Inst. of Tech., Newark.
H. S. Hundal, R. B. Trattner, and P. N. Chereminisoff.
Water and Sewage Works, Vol 127, No 1, p 54-55, January, 1980. 9 Fig, 24 Ref.

Descriptors: *Seawater, *Desalination plants, *Reverse osmosis, Freezing, Electrodialysis, Costs.

Methods for obtaining freshwater from seawater are reviewed. Freezing can be used for this purpose because when water is frozen it forms crystals that are structurally free of salt. The salt remains on the surface of the crystal and can be washed off. There is not yet any fully satisfactory method of washing ice crystals, however. Electrodialysis utilizes electricity and ion-selective membranes to remove salt. This process has been used to treat brackish water, but its application to seawater is limited by its high electricity requirements. Reverse osmosis has a low energy requirement and requires relatively simple equipment. About 95% of dissolved solids can be removed in a single unit, but two units would be required to make seawater potable. Fouling of the membrane by salt deposits can be a problem. Costs of desalination vary from about $0.60-$2/1000 gal. (Small-FRC)

3B. Water Yield Improvement

'NADIS', THE VITAL WATER RESOURCES OF THE INDIAN ARID ZONE,

Central Arid Zone Research Inst., Jodhpur (India).
K. D. Sharma, and D. C. Joshi.
Journal of Arid Environments, Vol 4, No 3, p 247-251, September, 1981. 2 Fig, 3 Tab, 1 Ref.

Descriptors: *Catchment basins, *Water supply development, *Construction methods, Design criteria, Nadis, *India, Arid lands, Soil types, Water management, Land management, *Water storage, Water resources, Water harvesting, Runoff, Storage reservoirs, Ponds.

One hundred nadis, ponds excavated in arid regions of India to capture and store precipitation for later use, were studied to provide a scientific basis and to suggest possible improvements in design and construction. At present villagers rely on their experience to select the best nadi sites. The physiographic settings of the five types of nadis in Nagaur district, West Rajasthan, were: dune complex (18 observations), sandy plain with deep soil (15), sandy plain underlain by concretion zone (21), younger alluvial plain (33), and rocky/gravel pediment (13). Their average depths were 2.2, 3.8, 6.0, 4.4, and 3.2 meters, respectively. Average volumes were (in thousands of cu meters): 23.5, 58.1, 192.1, 130.1, and 131.8, respectively. Catchment areas were 55.1, 94.3, 454.1, 313.7, and 300.1 hectares, respectively. Density was lowest in the dune complex (8 per 100 sq km) and highest in rock/gravel sediment (35 per 100 sq km). Average duration of use after filling was : 3.4, 3.8, 9.2, 11.3, and 9.9 months, respectively. Nadi volume was directly related to catchment area irrespective of surface, physiography, and rainfall. Highest nadi volumes were observed on dunes and sandy plains with slopes of 1-2%. It is recommended that nadis should be dug down to the CaC03 concretion zone in sandy soils. In dune and sandy areas, the catchment slope should be less than 2%, and in younger alluvial and rocky/gravel areas, greater than 2%. In dune areas nadi volumes are greater in the 300-350 mm rainfall zone than in higher rainfall areas. (Casser-FRC)

A NOTE ON MINIMIZING TEMPERATURE RISE BY RESTRICTING EVAPORATION FROM SMALL OPEN WATER SURFACES,

Salford Univ. (England). Dept. of Civil Engineering.
B. Henderson-Sellers.
Water S A, Vol 7, No 2, p 71-75, April, 1981. 1 Fig, 4 Tab, 16 Ref.

Descriptors: *Evaporation control, *Water storage, *Water temperature, Lake evaporation, Reservoir evaporation, Evaporation, Temperature, Energy, Mathematical studies, Dissolved oxygen, Acid climates, Precipitation gages.

A theoretical analysis of the surface energy budget was performed to calculate the effect on water and temperature evaporation of using small, floating polystyrene spheres to cover open water surfaces. The temperature change was found to be related primarily to the reflectivity of the spheres and not to the percent coverage. Only total coverage will prevent evaporation, although if 0.8 of the surface is covered, there is an evaporation asvings of 80%. Thus, for a large body of water, considerable savings in evaporative losses can be achieved together with a lowered water temperature even if the spheres are disturbed by, for example, the wind. In areas where there are water shortages, the cost of the covering material may be justified. When stored water is covered, there are higher concentrations of dissolved oxygen at saturation, unwanted plant growth is discouraged, and the water is more palatable. (Small-FRC)

A CENTURY OF EFFORT QUENCHES HONG KONG'S THIRST,

Y. L. V. Sharma.
Aqua, No 6, p 19-23, 1981. 3 Fig, 1 Tab.

Descriptors: *Water supply, *Water resources development, Water demand, Population dynamics, China, *Hong Kong, Resources development, Drinking water, Reservoirs, Channels, Water conveyance, Catchment areas, Desalination.

Hong Kong survives even though it has always had an almost complete lack of natural resources. The water supply problem results from too many people and an inadequate catchment area. The present, efficient water supply system was built over 120 years of effort by the government in conjunction with international consultants and engineers. Since direct catchment areas are limited, extensive catchwaters are a vital feature of the waterworks development, and probably nowhere else in the world have they been so highly developed. Constructed around hillsides, the catchwaters collect water from areas where it would normally drain more or less directly to the sea or into valleys unsuitable for reservoirs. In more modern approaches water is collected from stream courses by means of intakes and shafts discharging into a main tunnel which carries the water to either an impounding reservoir or a treatment works. Hong Kong's water supply system also includes two reservoirs in the sea, 16 conventional reservoirs, one of the world's largest desalination plants, 14 treatment works, and a third of its total 1,060 square kilimeter area as catchment. While developing its own methods of securing water, Hong Kong also made agreements with China which ensure sufficient water supplies for Hong Kong, with an average annual increase in supply of about 35 million cubic meters beginning in 1983. China will be supplying 620 million cubic meters of water per year to Hong Kong by 1995. These close ties with China, constant readiness to develop any possible sources using modern technology, and the close monitoring of the overall water situation have enabled the government to assure its over 5 million inhabitants that reliable water supplies are available. MANAGING SPRINKLE IRRIGATION WITH SALINE WATER FOR ZERO LEACHING,

Utah State Univ., Logan. Dept. of Engineering.
R. A. L. Brito.
PhD Thesis, 1980. 168 p, 22 Fig, 43 Tab, 49 Ref, 8 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-19236.

Descriptors: *Irrigation, *Sprinkler irrigation, *Saline water, *Leaching, Wastewater irrigation, Resources management, Water management, *Barley, Impaired water use.

A study was conducted with the objectives of (1) evaluating how long a salt-tolerant crop (barley) could resist a zero leaching situation where saline water was applied by irrigation, (2) comparing the effect of different salt composition of the irrigation water in increasing the EC of the soil solution, and (3) defining management strategies necessary to obtain a situation of no leaching under sprinkle irrigation. A greenhouse experiment was carried out that simulated a salt buildup which will take place in 13 years of continuous irrigation in the field for the soil types studied (silty loam and silty clay loam). Two types of irrigation water were used: one (W1) composed predominantly of sulfates and carbonates and the other (W2) composed primarily of chloride salts. The results pointed out that a zero leaching situation can be maintained with W1 and W2 for 13 or more years, for both soils. It was also found that W2 causes a faster increase in the EC of the irrigation water. Most of the results obtained at the end of the experiment agreed with predictions made by Robbin's model which was then used to determine an irrigation schedule that will allow for no leaching. Management strategies were proposed to eliminate deep percolation from a sprinkler source. Values of CU were estimated as the minimum required for different management according to the ratio of the average application to the lower limit of water application for the irrigated area. ENVIRONMENTAL EFFECTS OF APPLYING FEEDLOT RUNOFF TO GRASSLAND PLOTS BY SPRINKLER IRRIGATION,

Tennessee Univ., Knoxville.
N. Al-Masri.
PhD Thesis, March, 1980. 130 p, 23 Fig, 15 Tab, 55 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-18470.

Descriptors: *Feedlot runoff, *Sprinkler irrigation, *Water quality, *Environmental effects, Lagoons, Wastewater disposal, *Wastewater irrigation, Soil properties, Grasslands, Tennessee.

Irrigation of grassland with feedlot runoff appears to be a practical solution to the problem of disposal of such material. The major objectives of this study were: (1) to determine the effects on quality of surface water and groundwater of applying different rates of lagoon effluent on grassland plots, and (2) to determine effects on soil physical properties. A lagoon effluent irrigation system at the University of Tennessee-USDA Dairy Experiment Station at Lewisburg, Tennessee, served about 200 milk cows on a concrete lot from which runoff was collected into drains and delivered by gravity flow into a lagoon. The application of lagoon effluent to plots resulted in a high ammonia nitrogen concentration in surface runoff and groundwater from the plots which exceeded the maximum standard for raw surface water. The chemical oxygen demand concentration of the surface runoff and groundwater was much higher than that of nearby creek water. Factors existing at the time of lagoon effluent application which affected water quality parameters measured in surface runoff from the plots were: rainfall amount and intensities, soil moisture of the root zone, delay in time between lagoon effluent application and the occurrence of rainfall, and the rate at which lagoon effluent was applied to the plots. More reduction in the permeability and bulk density due to application of lagoon effluent occurred in the sandy loam soil than in the clay loam soil. The application of lagoon effluent with high solid fibrous material content caused more reduction in soil permeability and bulk density than lagoon effluent with low solid fibrous material content. CITY SEWAGE AND THE AMERICAN FARMER,
Carnegie-Mellon Univ., Pittsburgh, PA.
J. A. Tarr.
BioCycle, Vol 22, No 5, p 36-38, September/October, 1981.

Descriptors: *Land disposal, *Wastewater farming, *Farming, *Waste disposal, Land reclamation, Nutrients, Municipal wastewater, History, Wastewater irrigation, Public health, Costs, Irrigation, Fertilizers.

Land disposal of human wastes has been practiced for centuries in Europe and Asia. American farmers used wastes from cities for fertilizer during the 19th century. Sewage farming began in Great Britain about 1800 and in the U.S. about 1850, where it was called broad irrigation. In 1899 there were 24 municipal farms serving 280,000 people in New England and the West. Most of the subsequent development took place in the Southwest and Far West, where the prime motivation was irrigation. Although many publications extolled the merits of sewage farming, this process lost favor in the 20th century for 4 reasons: costs, public health and sanitary concerns, labor problems in the politically-run facilities, and large land requirements. Lessons to be learned from the past are: (1) all wastes require an ultimate sink, but sewage farming allows reclamation of vital nutrients, (2) cost accounting must be based on a system that considers long-term environmental impacts of sewage farming and its alternative disposal methods, (3) close monitoring is required to prevent health hazards and nuisances, and (4) sewage farming is most appropriate where sufficient land is available. YIELD AND DEVELOPMENT OF SOYBEANS (GLYCINE MAX L.) AS AFFECTED BY IRRIGATION WITH MUNICIPAL WASTEWATER AND WELL WATER,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Science.
M. J. Cordonnier.
PhD Thesis, 1981. 98 p, 10 Fig, 16 Tab, 101 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-26486.

Descriptors: Irrigation, *Agriculture, *Wastewater irrigation, *Soybeans, Irrigation effects, Impaired water use, Municipal wastewater, Well water, *Crop yield, Michigan, Glycine max L.

The objectives of this study were to determine if soybean (Glycine max L.) yields in Michigan could be increased with supplemental irrigation and to investigate the feasibility of using secondarily treated municipal wastewater as the water source. The study was conducted on a Miami silt loam soil in 1979 and 1980. Each water treatment was split into eight subplots consisting of two soybean cultivars; three replications were used with either wastewater, well water, or no water assigned to the main plots. Seed yields were significantly different for water treatments in 1979 with 2434, 2580 and 2786 kg/ha for no water, well water, and wastewater, respectively. Yields generally increased as plant population increased, with the greatest yield recorded for both cultivars occurring at the highest plant population. Irrigated plants were taller, matured later, had larger seeds and lodged slightly more than nonirrigated plants. Results of this experiment indicate that Harcor responds much better than Nebsoy to additional water and to the spatial arrangement of plants. Harcor also appears to have a higher water requirement than Nebsoy. The 1980 growing season was wetter than normal, and there was little or no yield response to irrigation. The two cultivars responded differently to the wastewater, with Harcor exhibiting a positive response and Nebsoy responding negatively for such things as leaf area index, leaf weight, and stem weight. Under the conditions of soil, climate and wastewater quality during this experiment, wastewater was generally superior to well water in increasing yields. (Sinha-OEIS)

3D. Conservation In Domestic and Municipal Use

WATER METERING AND CONSERVATION,
Council of Economic Advisors, Washington, DC.
S. H. Hanke.
Water/Engineering and Management, Vol 128, No 10, p 57-59, 1981. 1 Fig, 1 Tab, 6 Ref.

Descriptors: *Water metering, *Cost-benefit analysis, Water measurement, Water conservation, Water use, *Perth, *Australia, Costs, Water costs, Economic aspects, Mathematical studies, Mathematical models.

To evaluate the benefits and costs of water metering, it is convenient to use a formal water conservation model. The objective of such a study is to maximize the net benefits from the adoption of any given strategy. This is accomplished by pursuing a conservation policy as long as its incremental benefits exceed its incremental costs. A demonstration of the usefulness of such a model can be achieved by evaluating the benefits and costs of a water meter installation program such as the one installed in Perth, Australia. During the period of 1976-77, 14% of the total water produced was used by 17,968 unmetered water connections. Commercial establishments and residences accounted for this unmetered use. Universal metering would have called for the installation of 17,968 water meters. An equation which would allow computation of benefits of such a program is discussed. Factors in this equation include the predicted reduction in consumption, the marginal cost of water, the change in benefits, the costs associated with universal metering, and the resource costs to consumers of metering. Given the original objective of maximizing net benefits and the decision rule, universal metering for Perth turned out to be an economically attractive conservation policy. (Baker-FRC)

A. Streutker.
Water SA, Vol 7, No 2, p 97-106, April, 1981. 5 Fig, 7 Tab, 6 Ref.

Descriptors: *Irrigation efficiency, *Irrigation programs, *Water logging, Irrigation practices, Irrigation, Groundwater level, Canal seepage, Crop yield, *South Africa.

To improve irrigation efficiency and reduce leaching losses of fertilizers, water usage, irrigation management, and leakage from a canal system in South Africa were investigated. There had been complaints of waterlogging and salinization by users of the Vaalharts Government Water Scheme. Irrigation management was evaluated on flood irrigated beds with a GWT (groundwater table) at 1.4 to 2 m planted with groundnut. Over-irrigation was common, and leakage from the canals also contributed to waterlogging. Irrigation management contributed 42% of the waterlogging, while 10% was due to soil furrows and 5% to canal leakage. Farms with a deep GWT experienced more waterlogging than did farms with a relatively shallow GWT. Thus, irrigation management of the system could be improved with higher application rates for shorter periods. Subsurface drains would not be required to the extent that they are now, and larger areas could be irrigated during peak demand periods. (Small-FRC)

METHODOLOGY FOR OPTIMIZATION OF AN IRRIGATION SYSTEM WITH STORAGE RESERVOIRS,
Idaho Univ., Moscow. Dept. of Agricultural Engineering.
M. J. Khanjani.
PhD Thesis, August, 1980. 330 p, 25 Fig, 23 Tab, 216 Ref, 6 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-08743.

Descriptors: *Irrigation design, *Irrigation requirements, *Water storage, *Storage reservoirs, Model studies, Economic aspects, Optimization.

A procedure was developed to specify optimal plans for an irrigation system with temporary internal storage. The procedure was used to develop plans for 1865 ha using farm service reservoirs. Daily potential and actual evapotranspiration for 25 years were computed. Probability distributions of potential and actual evapotranspiration for 1-30 days duration were estimated. A log-normal probability distribution was found to best fit the data, and probability equations for different durations were computed. These distributions were used to determine possible irrigation intervals for different crops growing in different soil types. A marginal cost and benefit analysis was used to select the best irrigation intervals for all soil-crop combinations.

Water-use information was used to compute the volume of interval storage needed within the system. By utilizing a mixed integer programming model, the locations of farm service reservoirs were optimized; and seven of the original 15 farm service reservoir sites were selected. A linear programming model was then used to compute the optimum capacity of each farm service reservoir, and parametric programming was used to examine the effects of varying water costs of system configuration. The cost and design capacity of the irrigation system with seven farm service reservoirs was computed. The total cost was 32% less than the cost of the irrigation system with the 15 original proposed farm service reservoirs. (Sinha-OEIS)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

ASYNCHRONISM AND UNCORRELATED PHASES OF STREAMFLOW IN THE CASE OF ITS INTERBASIN TRANSFER WITH SPECIAL REFERENCE TO THE GEORGIAN SSR,
M. G. Babutsidze, B. A. Tutarashvili, and T. V. Shvelidze.
Water Resources (English Translation) Vol 7, No 6, p 524-527, November/December, 1980. 2 Ref. Translated from Vodnye Resursy, Vol 7, No 6, p 83-87, November-December, 1980.

Descriptors: *Diversion, *Diversion dams, *Hydroelectric power production, Rivers, Water level fluctuations, Seasonal variation, *USSR, Streamflow, Water transfer, Interbasin transfers.

Gravity flow diversion and diversion of water with pumping are analyzed from the point of view of asynchronism and uncorrelated phases of the streamflow. This study is related to the diversion of runoff from rivers of western Georgia (USSR) to eastern Transcaucasia. The delivery of part of the runoff from the Tskhenistskali River is analyzed as well as several proposed schemes. If the long-term fluctuations and annual distribution of the runoff of rivers coincide, then when water is diverted the amount of water in the basin receiving the runoff increases. When there is noncoincidence of long-term fluctuations, there is an increase in water and hydropower resources after diversion. Long-term asynchronism results in an increase in the minimum total volumes of annual runoff of individual rivers. (Small-FRC)

THE ECONOMICS OF URBAN STORMWATER MANAGEMENT,
Rice Univ., Houston, TX.
M. D. Maher.
PhD Thesis, May, 1980. 373 p, 39 Fig, 114 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-18068.

Descriptors: *Economic aspects, *Watershed management, *Storm runoff, *Urban runoff, Land use, Flooding, Cost-benefit analysis, Channeling, Runoff control.

Urban flooding and water quality problems are due to both natural phenomena and externalities related to urbanization. Development of upstream land increases the rate and amount of stormwater runoff from these areas. The consequences of increased upstream runoff are borne by downstream residents in the form of increased flooding and water pollution. It is shown that for a runoff control policy to be efficient; (1) because of irreversibility, runoff controls should be installed during a subdivision's construction. (2) The degree of a subdivision's detention of runoff should be based on the present value of damages that its runoff, in conjunction with other developments' runoff, will generate in the present and future. (3) The level of detention should reflect the location and timing of a development. Although runoff flows are irreversible, channelization can expand a stream's carrying capacity and reduce flooding without affecting runoff flows. The problems of the timing and sizing of irreversible upstream and downstream controls are explored in depth. It is shown that it is likely to be cost-effective to expand channel capacity to control some but not all future increases in runoff, some detention is likely to be efficient even in periods of excess channel capacity if in future periods runoff flows will increase to such an extent that irreversible 'congestion' of the channel will occur, and the probabilistic nature of rainfall and hence, runoff has significant policy implications. An important policy guideline is that watershed-wide stormwater management is necessary since uncoordinated community by community action cannot simultaneously implement runoff controls upstream and flood controls downstream. THE NILE - ONE RIVER AND NINE COUNTRIES,
High Aswan Dam Authority, Cairo (Egypt).
A-A. I. Kashef.
Journal of Hydrology, Vol 53, No 1-2, p 53-71, September, 1981. 2 Fig, 5 Tab, 19 Ref.

Descriptors: *Water resources development, *Water supply development, *Riparian rights, *Hydrologic budget, *Nile River, River basin development, Water reuse, Water requirements, Irrigation requirements, Water supply, Water management, Water demand, Water deficit, Africa.

The highlights of the water resource management efforts made on the Nile River by the nine countries through which the river flows are reviewed. At present, Egypt and Sudan practice modern methods of river control. Other countries drained by the Nile are planning to tap the water supply for expansion of irrigation projects. An estimated 96.57 cu kilometers of water/year will be needed to meet the water needs of the nine riparian countries, assuming that all proposed Nile projects are implemented. Water saving projects among the nations affected include developing groundwater supplies, building flood protection reservoirs, improving irrigation efficiencies by recycling, and utilizing the huge water supplies of Lake Albert and Lake Victoria. If these conservation projects are implemented and proper management authorities for Nile water resources are set up in the co-riparian countries, no shortages should be expected in meeting the water demands of these African nations in the near future. EFFECTS OF A BARRAGE ON FLUSHING AND WATER QUALITY IN THE FITZROY RIVER ESTUARY, QUEENSLAND,
Griffith Univ., Nathan (Australia). School of Australian Environmental Studies.
D. W. Connell, B. M. Bycroft, G. J. Miller, and P. Lather.
Australian Journal of Marine and Freshwater Research, Vol 32, No 1, p 57-63, 1981. 3 Fig, 5 Ref.

Descriptors: *Tidal rivers, Barriers, Water quality, Dams, *Saline water barriers, *Water quality control, Ecological effects, Rivers, *Fitzroy River, Rockhampton, *Australia, Fate of pollutants, Stream discharge, Zero discharge, Estuaries, Flushing.

Construction of a salt water barrier 65 km from the mouth of the Fitzroy River, Australia, increased the residence time of water and pollutants in the lower estuary by decreasing the amount of fresh water flow. At high river discharges in February (2000 million cu meters per month) residence time is 0.2 months; at low discharges in November (100 million cu meters per month), 3.5 months. Comparisons of salinity data indicate that the barrage now retains more fresh water during low river discharges than before construction. It can be inferred that pre-barrage residence times were shorter than post-barrage residence times during dry months and similar during rainy months. Tidal exchange, producing a residence time of 8 months before and after barrage construction, is the principal flushing mechanism during low discharge periods. Water quality parameters are similar upstream and downstream of the barrage during high discharge. Dissolved oxygen reductions and nutrient and chlorophyll a concentration increases are observed downstream during low or zero discharge. (Cassar-FRC)

4B. Groundwater Management

SUBSIDENCE–A GEOLOGICAL PROBLEM WITH A POLITICAL SOLUTION,
Civil Engineering (New York), Vol 52, No 5, p 60-63, May, 1980. 2 Fig.

Descriptors: *Subsidence, *Groundwater management, Water management, Water demand, Groundwater mining, Water policy, Political aspects, Groundwater recharge, Flood damage, California, Texas, Population dynamics, Geological fractures, Sewer systems, *Overdraft.

Groundwater overdraft has produced land subsidence in 17 known areas in the U.S. The most serious property damage has occurred in California and Texas. Management approaches usually stress local control. The Harris-Galveston Coastal Subsidence District was created in 1974 to regulate groundwater withdrawl. Although the subsidence has stopped, damage is permanent, causing continued flooding, poor storm drainage, and activation of geologic faults. Santa Clara, California, stored storm water for recharging the aquifer from 1932 to 1960. When the demand for water stripped to supply in 1960, the water district began other preventive measures--water importation, recharging, and weather modification. The overdraft and subsidence was stopped by 1969, but $100 million in damages had occurred, including buckling of well casings, changes in sewer slopes, and flooding from San Francisco Bay. Although subsidence in the agricultural San Joaquin Valley, California, had been under control, a recent drought caused overdrafts that increased subsidence greatly. Comprehensive plans for groundwater management have been thwarted by agricultural interests, by lack of public concern, and by the needs of expanding populations. (Cassar-FRC)

IRRIGATION, CROP YIELD AND DRAINAGE ON THE VAALHARTS IRRIGATION SCHEME: 2. THE OCCURENCE OF AND THE INFLUENCE OF DRAINAGE ON SALINIZED SOIL (IN AFRIKAANS),
Navorsingsinstituut vir Grond en Besproeiing, Pretoria (South Africa).
A. Streutker, H. W. Molenaar, H. Hamman, C. C. Nel, and J. H. Mulder.
Water SA, Vol 7, No 3, p 175-184, July, 1981. 6 Fig, 4 Tab, 14 Ref. (English Summary).

Descriptors: *Flood irrigation, *Saline soils, *Waterlogging, Irrigation effects, Groundwater recharge, Environmental effects, Drainage systems, Crop yield, *South Africa.

The Vaalharts Irrigation SCheme was investigated for salinization, leaching of salts, and drainage system efficiency. The 30,000 ha have been flood irrigated since before 1940, and the shallow water table combined with sand soil has resulted in waterlogging and severe salinization. By 1976, almost

3,000 ha were saline or saline sodic to a depth of 0.3 m. Five hundred km of subsurface lateral drains (1.5-1.7 m deep) were added in 1975-1977 in an attempt to control the water table and promote the leaching of salts. These drains were successful in keeping the water table below 0.7 m and reducing salinization, but 1500 ha of saline soils remained in 1977 and about 1000 ha in 1980. A shallow drainage system might be able to retain beneficial groundwater supplies while counteracting the salinization of the soil. A system such as this would be acceptable if maintenance of the water table did not require considerable over-irrigation, resulting in river pollution. (Small-FRC)

GROUNDWATER ALLOCATION MECHANISMS: THE CASE OF WESTERN KANSAS,

Kansas Univ., Kansas City. Dept. of Economics.
D. R. Collins.
PhD Thesis, September, 1980. 118 p, 16 Fig, 2 Tab, 47 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-11728.

Descriptors: *Economic aspects, *Groundwater management, Property rights, Decision making, Administrative decisions, Resource allocation, *Water allocation, Water resources development, *Kansas.

The characterization of 'optimal' time paths for the development of groundwater resources within alter-native institutional settings is discussed. Optimality is defined in terms of the objectives of the agent or agents having authority to make decisions and carry out the associated actions relating to the use of the resource and does not imply superiority of one institutional setting relative to others. The institutional setting defines the decision-making authority of agents in the economy and any constraints which may be imposed by the social framework. Conditions relating to the supply of groundwater in western Kansas, economic incentives for its development, and the historical development in Kansas of a framework of property rights relating to groundwater are considered. Alternative institutional settings for groundwater development are formulated in the context of optimal control problems. The implications of operating costs for the comparison of groundwater allocation mechanisms is considered. The results of the study indicate that when decision-making authority is decentralized, the marginal conditions relating to groundwater allocation over time may differ from those selected under central control. It is indicated that significant differences in cost may be associated with operation of the allocation mechanisms under these alternative settings. The restrictions on the economic environment which are required for the groundwater resource allocation problem to be compatible with this method of analysis are outlined. (Sinha-OEIS)

HYDRODYNAMIC RESPONSE OF NAKHON LUANG AQUIFER, BANGKOK, THAILAND,

Asian Inst. of Tech. Bangkok (Thailand). Div. of Water Resources Engineering.
A. Das Gupta, and M. Siddique.
Ground Water, Vol 19, No 5, p 469-475, September/October, 1981. 9 Fig, 1 Tab, 7 Ref.

Descriptors: *Aquifers, *Hydrodynamics, Hydrology, *Thailand, Bangkok, Nakhon Luang Aquifer, Groundwater, Groundwater reservoirs, *Groundwater management, Aquifer characteristics, Water supply, Water demand.

A comprehensive study has been undertaken to maintain the water supply of the Nakhon Luang Aquifer in Bangkok. This paper outlines the existing situation and points out in quantitative terms the future implications of the present trend of pumpage and of some probably controlled pumpage foreseeable at this stage. The Chao Phraya Plain consists of a broad, deep basin filled with Sedimentary soil deposits which form alternating layers of sand, gravel and clay. In the upper 600 meters depth from the ground surface there are eight confined aquifers seperated by virtually impervious strata of clay. The Nakhon Luang Aquifer is of prime importance, as it supplies the majority of the wells in the city of Bangkok at the present time. This aquifer consists of permeable sand and gravel with clay lenses and leaky clay beds, and yields excellent quality water except in the southern region and especially in the Phra Pradaeng area where salt water is encountered due to overpumping. In a simulation of the hydrodynamic behavior of this aquifer using information on hydrogeology and hydraulic aspects available, it was determined that with continuation at the present rate of increase in pumpage, a severe decline of piezometric head is predicted for the future. Active initiative is needed from the authorities concerned to increase the surface-water supply facility and to adopt certain control measures to restrict the private and industrial usage of ground water in the area. THE MEADOWBROOK ARTIFICIAL-RECHARGE PROJECT IN NASSAU COUNTY, LONG ISLAND, NEW YORK,

Geological Survey, Syosset, NY. Water Resources Div.
D. A. Aronson, and M. Beyth.
Long Island Water Resources Bulletin 14, 1980. 23 p 10 Fig, 1 Tab, 33 Ref. Nassau County Department of Public Works.

Descriptors: *Artificial recharge, *Groundwater recharge, *Injection wells, *Reclaimed water, Ponding, Water reuse, Water management, New York, *Long Island, Nassau County, Suffolk County, Land application, Water supply, Wastewater treatment.

In Nassau and Suffolk Counties, where the quality and quantity of potable ground water have declined as a result of urbanization, the use of highly treated wastewater (reclaimed wastewater) to replenish the ground-water supply is technically feasible. Two methods that are particularly well suited to Long Island are surface ponding of the reclaimed water in basins so that it can infiltrate to the water table, and injecting the reclaimed water into the ground through wells. At the Meadowbrook artificial-recharge project site in East Meadow, a system of 11 basins and 5 injection wells will return to the ground-water reservoir 4 million gallons per day of reclaimed wastewater, supplied by the Cedar Creek water-reclamation facilities. This demonstration project is intended to study the effectiveness of using reclaimed wastewater to replenish and improve the chemical quality of Long Island's ground-water supply. Knowledge gained in the study will have applicability to other areas where the need to conserve and augment fresh-water supplies has become critical. (USGS)

THE OCCURRENCE AND CONTROL OF LAND SUBSIDENCE DUE TO GROUNDWATER WITHDRAWAL WITH SPECIAL REFERENCE TO THE SAN JOAQUIN AND SANTA CLARA VALLEYS, CALIFORNIA,

Stanford Univ., CA. Dept. of Geology.
J. F. Poland.
PhD Thesis, June, 1981. 176 p, 44 Fig, 5 Tab, 120 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-24135.

Descriptors: *Groundwater depletion, *Subsidence, *Compaction, Groundwater recharge, Groundwater basins, Aquifers, Aquitards, Elastic properties, Aquifer characteristics, *Groundwater management, Injection wells, San Joaquin Valley, Santa Clara Valley, *California, Repressuring, Subsidence control.

The San Joaquin Valley in California is the area of the most intensive land subsidence in the United States. in the Santa Clara Valley at the south end of San Francisco Bay, excessive pumping of ground water between 1917 and 1967 caused as much as 180 ft (50 m) of artesian-head decline and maximum land subsidence of 13 ft (4 m). Wilmington oil field, in the harbor area of Los Angeles and Long Beach, California, is not only the oil field of maximum subsidence in the United States but also the outstanding example of subsidence control by injection and repressuring. Both direct and indirect evidence is accumulating to indicate that, under the total stresses applied to unconsolidated heterogeneous deposits in overdrawn ground-water basins, most of the compaction of the aquifer systems is in the fine-grained aquitards and little is in the coarse-grained aquifers. In a confined system that is compacting because of decrease in fluid pressure, compaction and subsidence can be stopped by raising fluid pressures in the aquifers sufficiently to eliminate excess pore pressure in the aquitards and confining beds (clays or shales). Moreover, the system (both aquifers and aquitards) will expand elastically and the land surface will rise if fluid pressures are increased above preconsolidation conditions. In liquid-waste disposal also, the response of the sediments normally would be in the elastic range. (Sinha-OEIS)

MODELING THE ECONOMICS OF GROUND WATER MANAGEMENT,

Auslam and Associates, Inc., Sacramento, CA.
J. E. Noel.
In: Proceedings of the Thirteenth Biennial Conference on Ground Water, Irvine, September 14-15, 1981. California Water Resources Center, University of California, Davis, Report No 53, November, 1981. p 92-102. 3 Fig, 2 Tab.

Descriptors: *Groundwater management, Mathematical models, Hydrologic models, Water resources development, Simulation analysis, Value, Surface water, Mathematical studies, Hydrologic data collections, Water balance equation, Water costs, *Economic aspects, *Irrigation, *Crop production, *Model studies.

A hydrologic-economic modeling framework can be a valuable tool when used to evaluate the economic consequences of different groundwater and surface water management scenarios. There are two operational problems associated with developing a hydrologic-economic model of groundwater management: estimating the different economic and hydrologic relationships that make up these components of the problem, and interrelating the economic and hydrologic elements so that each provides information to the other in a continuous and consistent manner. Four mathematical models--two hydrologic, one economic, and one with hydrologic and economic elements--are discussed that make up the San Joaquin Valley Hydrologic-Economic Modeling system (HEM). One hydrologic model is the surface water allocation model (SWAM) which computes a mass water balance (inflows, losses, outflows) so that supply equals demand at every conveyance facility in the Valley's surface supply network. The other hydrologic model is a layered two-dimensional saturated flow groundwater model which can simulate unconfined flow in the top layer of the groundwater basin and confined flow in the bottom layer. The economic non-linear programming model can determine optimal changes in farm income, cropping patterns, irrigation technologies, and land use given changes in crop demand, crop production costs, and water management scenarios. The final model in the HEM system is the Linear Quadratic Control Model: it is a policy model from which optimal pumpage and groundwater depths can be

determined over a specific period under different water management scenarios. (Atkins-Omniplan)

MANAGING WELLS FOR ENERGY EFFICIENCY,
California Univ., Davis. Dept. of Civil Engineering.
O. Helweg.
In: Proceedings of the Thirteenth Biennial Conference on Ground Water, Irvine, September 14-15, 1981. California Water Resources Center, University of California, Davis, Report No 53, November, 1981. p 119-127. 8 Fig, 4 Ref.

Descriptors: *Wells, *Well yield, *Pump wells, *Optimal yield, Pumping head, Head loss, Discharge capacity, Effective capacity, Benefits, *Groundwater management, Energy efficiency.

Saving energy is advantageous from an economic as well as an ecological viewpoint. When water well yield deteriorates or when the optimal discharge of a pump decreases either or both should be replaced or repaired. A wire-to-water test is used to evaluate electrical driven pumps. Loss in pump efficiency should be measured over time to establish a trend. The results then need to be normalized, i.e., compared to maximum efficiency at the same discharge and head. Correcting pumping inefficiences involves: (1) when to correct the inefficiency, and (2) what the correction should be, i.e., repair or replacement. In economic terms, pump replacement is recommended when the marginal net benefits of the defender equal the maximum amortized net benefits of the challenger. Several tables show how these calculations are made. A similar analysis is made, and a formula given, to determine when to rehabilitate a well. Simply, a well should be rehabilitated when the maximum annualized net benefits of rehabilitation are greater than the old annual (marginal) net benefits. If a well is not affected by rehabilitation, replacement analysis is needed; however, some wells deteriorate so slowly that pumping costs do not increase and the economic life of the well is infinite. Other factors hold in general for wells: pumping costs are usually higher than well construction costs; replacement analysis for municipalities is simpler because there is no tax, whereas a private owner must consider the impact of taxes and depreciation; and the most economical design should be chosen over the cheapest when drilling a new well so as to save future energy. ARTIFICIAL BASIN RECHARGE,
Water Management Research Laboratory, Fresno, California.
H. L. Nightingale, and W. C. Bianchi.
Water/Engineering and Management, Vol REF, No HB, p R85-87, R89-92, 1981. 4 Fig, 84 Ref.

Descriptors: *Recharge basins, *Artificial recharge, *Planning, Basins, Recharge, Groundwater, Soil profiles, Geology, Surveys, Productivity, *Groundwater management.

Basin-type artificial recharge and preconstruction field surveys are discussed. These surveys are made to evaluate the magnitude of potential problems as related to both a project's recharge rate and its environmental impact. A multidisciplinary approach is needed to plan and operate a successful recharge facility. Assuming that the size of the groundwater basin and amount of storage capacity available are amenable to recharge, seven phases have been identified, in order of priority: precursory site evaluation, soil profile and subsurface geology determinations, recharge water quality determinations, biological considerations, pilot test basin study, construction plants, and the operation, maintenance and performance evaluation plans. In most reports of failures of basin recharge facilities and small experimental sites, soil clogging is to blame. This clogging is caused by sediment in the recharge water. The reason for sediment formation is not always clearly apparent. Sediments can be generated by improper construction techniques. Soil compaction from heavy construction equipment rarely seems to be at fault. The chances of long-term economical basin recharge can be improved by superimposing on the purely engineering aspects of construction and operation the principles of soil chemistry, hydrology, water chemistry, aquatic biology and subsurface geology. Interaction between engineering and environmental factors must be carefully considered to increase the chances for valid decisionmaking and planning which will produce a successful basin recharge facility. WILL THE WORLD FACE UP TO ITS EVER-WORSENING ENVIRONMENTAL PROBLEMS,
Civil Engineering (New York), Vol 50, No 9, p 71-74, September, 1980.

Descriptors: *Environmental effects, *Soil erosion, *Forest management, Erosion, Acid rain, Deserts, Saline soils, Water quality, Irrigation water, Water pollution effects.

Among the world's most pressing environmental problems are soil deterioration (erosion and salinity buildup), atmospheric changes (including acid rain), and accelerating extinction of plant and animal species (deforestation and wetlands destruction). Results of soil erosion are siltation of rivers and reservoirs, impaired water quality, and a return of agricultural land to desert. Salt buildup in farmed areas is serious both in poorer countries such as India and Pakistan and in the San Joaquin Valley, California. This condition can be alleviated and prevented by using enough irrigation water to flush out the accumulated salts. However, downstream farmers are then faced with higher salt levels in their irrigation water. Acid rain, formed from burning of sulfur-containing fuels, also damages soil. This is now a problem in the eastern and southwestern U.S., northern and eastern Europe, and parts of the Soviet Union and Australia. Deforestation, especially in the tropics, destroys the land's ability to store water, producing rapid runoff during rainfall, intensified flooding, and water shortages during dry spells. (Cassar-FRC)

TEMPORARY HYDROLOGIC CHANGES AFTER DEFORESTATION FOR PIONEER HOMESTEADING,
H. Ryckborst.
Journal of Hydrology, Vol 53, No 1-2, p 117-133, September, 1981. 10 Fig, 1 Tab, 11 Ref.

Descriptors: *Clear-cutting, Snowmelt, *Geohydrology, *Soil porosity, *Groundwater level, Forest hydrology, Forest soils, Groundwater runoff, Sublimation, Soil profiles, *Groundwater recharge, Evaporation, Radioactive tracers, *Water level fluctuations, *Alberta, Canada.

Modern homestead lands in Central Alberta, Canada that have been cleared of forest and brush experience a temporary disturbance in soil profile and a slight increase in effective porosity of groundwater recharge areas. An 8-year experiment on the impact of deforestation on the hydrology of a research catchment of the homestead lands using radioactive tracers showed that these impacts should be only minor and temporary. In the recharge areas, deforestation caused the groundwater table to drop by 0.2-0.5 m with an average two year recovery period. In the remaining groundwater discharge areas, groundwater table levels rose due to decreases in the effective porosity caused by mechanized deforestation. The main impacts of homesteading deforestation are a slight increase in total snowmelt runoff from 60 to 75 millimeters/year, a shortening of the snowmelt period from 5 to 4 weeks, an increase in snowmelt groundwater runoff from 1.0 to 1.9 millimeters/day and a decrease in snow-cover sublimation and evaporation by 40%. (Geiger-FRC)

EFFECT OF FELLING FORESTS ON FLOOD RUNOFF IN THE CARPATHIAN MOUNTAINS WITH SPECIAL REFERENCE TO BEECH FORESTS,
O. V. Chubatyi.
Water Resources, Vol 8, No 1, p 13-18, January/February, 1981. 5 Tab, 1 Ref. Translated from Vodnye Resursy, No 1, p 48-55, January/February, 1981.

Descriptors: *Logging, *Runoff coefficient, *Clear-cutting, Snowmelt, Precipitation, *Flood discharge, Forest watersheds, Forest management, *Carpathian Mountains, *USSR, Infiltration, Rainfall-runoff relationships, *Forest soils.

Infiltration into forest soils was studied in 3 forested watersheds in the Transcarpathian Mountains, U.S.S.R., a region of high precipitation frequency. After a 5-year calibration period, the first basin was clear-cut; the second, 2-step felled (30% cutting followed by the remainder of the timber cut 8 years later); and the third acted as a control. During the calibration period flood runoff coefficients increased with increasing values of effective precipitation and were similar in the 3 basins (0.03-0.39). After clear-cutting in Basin I and the first stage of cutting in Basin II the coefficients were 0.02-0.91 and 0.02-0.68, respectively. In the 2-year period after the second (final) step of cutting in Basin II, the flood runoff coefficients were: I, 0.05-0.89; II, 0.13-0.71; and III (control), 0.03-0.30. Maximum flood runoff coefficients were seen after melting of snow. When summer cloudbursts overlapped, runoff coefficients increased progressively. The ratio of runoff coefficients for Basin I:Basin III and Basin II:Basin III were higher for the first year after felling than for the fourth year after felling. (Cassar-FRC)

AN ORGANICS DETECTION SYSTEM FOR THE OHIO RIVER,

Ohio River Valley Water Sanitation Commission, Cincinnati.
L. Weaver, R. Boes, and G. Moore.
Water Science and Technology, Vol 13, No 3, p 227-236, 1981. 3 Fig, 2 Tab.

Descriptors: *Water quality control, *Monitoring, *Chlorinated hydrocarbons, Water pollution control, Pollutant identification, *Ohio River, Organic compounds, Water analysis, Rivers, Chemical analysis, Carbon tetrachloride, Chloroform, Trihalomethanes, Industrial wastes, Heavy metals, Polychlorinated biphenyls, Sediments, Fish, Pesticides, Industrial spills.

In 1977 the Ohio River Valley Water Sanitation Commission established the Early Warning Organics Detection System to detect organic pollutants in river water after the well-publicized spill of carbon tetrachloride into the Kanawha River, a major Ohio tributary. Local water treatment plants or industrial plants provide laboratory space and personnel for the Commission's gas chromatographic equipment. If any of the daily samples indicate organics levels significantly above the background level, the EPA confirms the analysis with more sophisticated analytical equipment, and downstream water users are promptly notified of the pollutant load. Equipment costs for the program were $300,000, and annual operating costs are $20,000-$25,000. In addition, fish diversity studies and analysis of fish tissue and sediments are conducted. Fish populations have improved in production, diversity, and stability since the 1957-60 baseline study. During the last 9 months of 1979 most of the total 1350 samples contained less than 0.1 micrograms per liter of the 19 purgeable halocarbons under consideration. Compounds found in the amounts greater than 10 micrograms per liter were chloroform, methylene chloride, bromodichloromethane, chlorobenzene, and carbon tetrachloride. Chloroform is found in 70% of the Ohio River samples and 13% of the tributary samples. Chlorobenzene appears primarily in the main river; carbon tetrachloride seems to originate in the Kanawha River. The monitoring program has proved to be an effective safeguard of downstream water supplies, and aid in identifying pollution sources, and a deterrent to potential polluters. (Cassar-FRC)

HIGH PERFORMANCE LIQUID CHROMATOGRAPHIC DETERMINATION OF CARBARYL AND 1-NAPHTHOL AT RESIDUE LEVELS IN VARIOUS WATER SOURCES BY DIRECT INJECTION AND TRACE ENRICHMENT,

Maine Univ., at Orono. Dept. of Food Science.
R. J. Bushway.
Journal of Chromatography, No 211, p 135-143, June, 1981. 3 Fig, 3 Tab, 30 Ref.

Descriptors: *Carbaryl, *Water analysis, *Pesticide residues, Pollutant identification, Insecticides, Herbicides, Chromatography, Naphthol, Organic compounds, Carbamate pesticides.

Carbaryl and its hydrolysis product, 1-naphthol, at low ppb concentrations in water were determined by a high-performance liquid chromatographic method. Water samples were filtered through a 0.45 micrometer Millipore filter and injected directly into the chromatograph system, which used a variable wavelength UV detector reading at 222 nm. No cleanup, concentration, or derivatization were required. Levels less than 1 ppb were determined by first concentrating the sample with an activated C18 Sep-Pak cartridge using a fluid metering pump. Samples of ocean water, stream water, and drinking water were spiked with carbaryl and 1-naphthol at concentrations from 3.78 to 207 ppb. Coefficients of variation ranged from 2.5 to 10.7%. Different types of water with equal amounts of carbaryl did not produce the same peak height; therefore, a working standard should be made up daily with water as near as possible in composition to the sample being analyzed. Other pesticides successfully detected with this system were carbofuran, methomyl, azinphosmethyl, benomyl, monuron, propham, chloropropham, pentachlorophenol, the oxygen analog of azinphosmethyl, and simazine. Atrazine co-chromatographed with carbaryl, and pentachloronitrobenzene, diuron and thiram interfered with the 1-naphthol determination. (Cassar-FRC)

ENUMERATING BACTERIA IN RIVER WATER AND SEWAGE EFFLUENT,

Western Kentucky Univ., Bowling Green. Dept. of Biology.
L. P. Elliott.
Water/Engineering and Management, Vol REF, No HB, p R122-R123, 1981. 1 Fig, 2 Tab, 7 Ref.

Descriptors: *Sewage bacteria, *Assay, Bacteria, Rivers, Chlorination, Bacterial analysis, Water quality, River water, Path of pollutants, Wastewater treatment.

A technique is reported for enumerating bacteria in river water and sewage effluent in which the medium was spread-inoculated with calibrated loops delivering 0.01 or 0.001 ml. The results were compared with the standard spread plate-count technique for the enumeration of baceria in river water. The spread plate technique was used inasmuch as there was no reduced growth rate of obligate aerobes and no danger of killing heat sensitive organisms with hot-agar. Five sampling sites were chosen about 1/4 mile apart in the Barren River flowing through Bowling Green, Kentucky. One site was upstream from the sewage disposal plant, another was in the effluent from the plant's discharge pipe, and three were downstream from the discharge outlet. Sampling was done from a boat at midstream, with samples taken semimonthly during March 1978 through February 1979. In a comparison of the standard usual spread plate method versus the plate loop method, the two methods were not significantly different. Sometimes the effluent count was lower than the counts from other sampling stations. The wastewater treatment plant provides primary and secondary treatment by means of an activated biological filter system which is a combination activated sludge and trickle-filter process. All effluent is chlorinated by automated chlorinators. It was concluded that calibrated loops which deliver 0.01 and 0.001 ml, when used as described in this paper, provided a simple, rapid, reliable means of inoculating agar media for estimating populations of bateria in water. IDENTIFICATION AND DETERMINATION OF AMINOCARB IN NATURAL WATER AND BALSAM FIR FOLIAGE. (RECHERCHE ET DOSAGE DE L'AMINOCARB DANS LES EAUX NATURELLES ET LE FEUILLAGE DU SAPIN BAUMIER PAR CHROMATOGRAPHIE EN PHASE GAZEUSE),

Service de Protection de l'Environnement, Sainte-Foy (Quebec).
G. Mamarbachi.
Bulletin of Environmental Contamination and Toxicology, Vol 24, No 3, p 415-422, 1980. 1 Tab, 4 Fig, 10 Ref. (English Summary).

Descriptors: *Pesticides, Agricultural chemicals, *Forestry, *Agricultural hydrology, Environmental effects, Surface waters, Gas chromatography, Vegetation, Vegetation effects, Chemical analysis, Chloroform, Water pollution, Chemical properties, Reagents, Degradation products, Fir trees, Leaves, *Pollutant identification, *Aminocarb.

A method for the determination residues of the insecticide aminocarb in natural waters and balsam fir foliage is described. Average recoveries of more than 90% from foliage and nearly 100% from water can be achieved. The insecticide is extracted from water with chloroform and from foliage with ethyl acetate. The extracts are purified by coagulation with an aqueous solution of ammonium chloride and phosphoric acid. The solution is partitioned with methylene chloride, neutralized with sodium carbonate and then extracted with chloroform. The extract is then concentrated and injected directly into a gas chromatograph equipped with a dual nitrogen-phosphorus detector. (Titus-FRC)

STUDIES OF THE TRANSFORMATIONS OF FORMS OF CARBON, NITROGEN, PHOSPHORUS, SULFUR AND SOME PRINCIPAL MINERAL ELEMENTS DURING THE MEASUREMENT OF THE TOTAL OXYGEN DEMAND - II. TRANSFORMATION OF FORMS OF NITROGEN (IN FRENCH),

Institut National des Sciences Appliquees, Toulouse (France). Lab. de Chimie et Genie de l'Environnement.
B. Capdeville, C. Laffont, and H. Roques.
Water Research, Vol 14, No 5, p 501-509, May, 1980. 12 Fig, 2 Tab, 13 Ref. (English Summary).

Descriptors: *Oxygen demand, *Analytical techniques, *Chemical interferences, Nitrogen compounds, Inorganic compounds, Amino acids, Model studies, Oxidation, Laboratory equipment.

The oxidizability of organic compounds containing nitrogen was studied along with the interferences due to the presence of ammonium, nitrous and nitric nitrogen ions in the water. At a total oxygen demand of 0-250 mg/l the organic and ammonium nitrogen are partially oxidized and transformed into a mixture of N2 and NO. This illustrates the advantage of the TOD (total oxygen demand) meter compared with classic COD and BOD5 oxidation tests, where these elements are rarely taken into account and these forms are oxidized incompletely. Nitrous and nitric nitrogen create important negative interferences, but they can be corrected for by a simple proposed tabular method. Measurements were made using TOD meter to distinguish the stable forms of organic and inorganic nitrogen after high temperature catalytic action. (DL) citrulline, (DL) aspartic acid, creatinine, (L+) glutamine, (DL) threonine, (L-) asparagine, beta-alanine, (L+) arginine and (DL) serine were used as model organic nitrogen compounds. (Hertzoff-FRC)

STUDIES OF THE TRANSFORMATION OF CARBON, NITROGEN, PHOSPHORUS, SULPHUR AND THE PRINCIPAL MINERAL ELEMENTS IN THE COURSE OF MEASURING TOTAL OXYGEN DEMAND--III. TRANSFORMATION OF SULFUR (IN FRENCH),

Institut National des Sciences Appliquees, Toulouse (France). Lab. de Chimie et Genie de l'Environnement.
C. Laffont, B. Capdeville, and H. Roques.
Water Research, Vol 15, No 5, p 561-572, 1981. 8 Fig, 1 Tab, 7 Ref. (English Summary).

Descriptors: *Oxygen demand, *Sulfur compounds, *Wastewater analysis, Pollutant identification, Chemical analysis, Chemical oxygen demand, Seawater, Sulfate, Sulfite, Sulfides, Organic compounds, Chemical reactions, Chemical interference.

Interferences with measuring oxygen demand using the Dow Chemical Ionics 225 TOD (total oxygen demand) meter and the COD method were determined in waters containing inorganic salts (such as industrial wastewaters and seawater). Sulfur-containing organic compounds of the type CxHyOxS were partially oxidized to SO2 and SO3 in a consistent manner in the TOD test and variably in the COD test. Sulfate and sulfite ions were negatively correlated with TOD, and sulfide was positively correlated. Corrective equations were developed to account for these interferences. The TOD test was better than COD for determining organic pollutants in the presence of inorganic salts. (Cassar-FRC)

CARBON ISOTOPE ANALYSIS OF CARBONACEOUS COMPOUNDS IN PUGET SOUND AND LAKE WASHINGTON,

Washington Univ., Seattle.
J. R. Swanson.
PhD Thesis, August, 1980. 230 p, 34 Fig, 14 Tab, 358 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-09776.

Descriptors: *Biochemistry, *Carbon radioisotopes, *Water pollution, Organic matter, Sediments, Aromatic hydrocarbons, Aliphatic hydrocarbons, Water pollution sources, *Puget Sound, *Lake Washington, Carbonaceous compounds, Biogeochemistry, Carbon Isotope Analysis.

A new method has been developed and tested for determining chronological profiles of organic pollutants. This method, Carbon Isotope Analysis (CIA), involves measurement of 12C, 13C and 14C in carbonaceous compounds found in layers of sediment. Lipids, total aliphatic hydrocarbons (TAHs) and polycyclic aromatic hydrocarbons (PAHs) are separated from kg quantities of sediment. The basic principle of Carbon Isotope Analysis is the fact that natural isotopic differences present in organic compounds are due to their respective sources. Carbon Isotope Analysis uses three levels of 14C in organic compounds to develop a chronological profile of the anthropogenic impact on sedimentary organic compounds. The overall impact of organic pollutants on a given region often cannot be determined by compound identification alone. Most sophisticated analytical instruments often confuse compounds derived from petroleum and coal dust with natural organic degradation products. By using Carbon Isotope Analysis, additional insight to pollution can be obtained and the impact of chronic levels of toxicants can be identified. This investigation reviewed carbon isotopic data and carbon cycling and analyzes organic pollution in two limited ecosystems (Puget Sound and Lake Washington).

SPECIATION OF ENVIRONMENTAL POLLUTANTS BY GC-AA AND BY ESCA. PURIFICATION OF WATER AT ULTRATRACE LEVELS OF HEAVY METALS AND COMPLEXATION STUDIES BY ELECTROCHEMICAL METHODS,

Louisiana State Univ., Baton Rouge. Dept. of Chemistry.
I. A-L. Rhodes.
PhD Thesis, May, 1980. 347 p, 91 Fig, 24 Tab, 225 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-21759.

Descriptors: *Pollutant identification, *Heavy metals, *Water pollution, *Lead, *Speciation, Electrochemistry, Gas chromatography, Spectral analysis, Bibliographies, Air pollution, *Tetraethyl lead(TET), Environmental pollution, Airborne pollutants, Comlexation.

A GC-AA method was developed that allowed the simultaneous determination of PbEt4 and of PbEt3C1 in gaseous and liquid sampled. This method enabled the study of the behavior of PbEt4 (TEL) and the formation of PbEt3C1 in sea water under several experimental conditions. From the results obtained, the potential hazard of TEL spills at sea was evaluated as well as the effect of particulate materials present in sea water on TEL concentration levels. Airborne heavy metal pollutants were studied by ESCA and the final chemical form of airborne Pb was found to be Pb02. The importance of ESCA as a valuable tool for speciation of airborne matter was demonstrated. An electrochemical method was developed to produce a readily available and economic source of ultrapure water. A method was developed for the determination of stability constants of heavy metal complexes and for the study of reaction kinetics of complex formation. The electrochemical technique was illustrated with Cd, Pb and Zn complexes of EDTA. Problems in storing very pure water and very dilute solutions of metal compounds are also discussed. An essentially complete literature review of each subject discussed is included. (Sinha-OEIS)

THE CHARACTERIZATION AND ANALYSIS OF CHLORINATED ORGANIC COMPOUNDS DERIVED FROM CHLORINATION OF HUMIC SUBSTANCES IN SURFACE WATERS,

Massachusetts Univ., Amhurst. Dept. of Chemistry.
B. D. Quimby.
PhD Thesis, September, 1980. 199 p, 35 Fig, 5 Tab, 79 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-01385.

Descriptors: *Pollutant identification, *Chemical analysis, *Organic compounds, *Surface water, Chlorination, Drinking water, Phenols, Fulvic acids, Humic acids, Gas chromatography, Trihalomethanes, Microwave emission detection(MED).

Suitable strategies were developed for characterizing the halogenation products of humic materials, both the trihalomethanes and other expected products. To provide element selective detection for gas chromatographic studies, a microwave emission detection system (MED) was developed utilizing an echelle grating spectrometer and a TM sub 010 resonant microwave cavity to sustain a plasma in helium at atmospheric pressure. The MED system was applied to the determination of the trihalomethanes in drinking water. Glass capillary gas chromatography was used in conjunction with the MED system to examine the chlorination products of humic and fulvic acids. The results indicate that in addition to the trihalomethanes, significant numbers of chlorinated phenolic and/or acidic compounds can be formed. The presence of bromide ion in the chlorination mixture was shown to result in bromine-containing compounds as well. Since many of these compounds cannot be gas chromatographed directly, chemical derivatization with diazomethane was employed. The number of halogen-containing substances that appear in the element-selective chromatograms was greatly increased after methylation of the samples. Several halogenated phenols and aromatic carboxylic acids have thus far been tentatively identified by retention times. (Sinha-OEIS)

BALANUS EBURNEUS: A SENSITIVE INDICATOR OF COPPER AND ZINC POLLUTION IN THE COASTAL ZONE,

Florida Inst. of Tech., Melbourne.
S. Barber, and J. H. Trefry.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 654-659, November, 1981. 4 Fig, 11 Ref.

Descriptors: *Bioindicators, *Barnacles, Copper, Zinc, *Pollutant identification, Fate of pollutants, Eau Gallie Harbor, Indian River Lagoon, *Florida, Bioaccumulation, Accumulation, Metals, Heavy metals, Coastal waters.

Barnacles, Balanus eburneus, were a sensitive indicator of copper and zinc pollution in the moderately polluted waters of the Eau Gallie River and Indian River Lagoon, Florida. Tissues accumulated about 36 ppm Cu for each 1 ppb increase in water Cu levels. Barnacle tissue collected at 8 sites contained 11-64 micrograms of Cu per g dry weight; dissolved Cu levels in water at these sites were 0.4 to 1.6 micrograms per liter, and total Cu, 0.8 to 2.7 micrograms per liter. Zn concentrations in barnacle tissues ranged from 360 to 12,000 micrograms per g dry weight. Possible sources of metal pollution in the system were sewage effluent, a railway trestle, and antifouling paints. (Cassar-FRC)

STATISTICAL MODELS FOR ESTIMATING SEAWATER METAL CONCENTRATIONS FROM METAL CONCENTRATIONS IN MUSSELS (MYTILUS EDULIS),

Simon Fraser Univ., Burnaby (British Columbia). Dept. of Chemistry.
J. D. Popham, and J. M. D'Auria.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 660-670, November, 1981. 2 Fig, 3 Tab, 18 Ref.

Descriptors: *Mussels, *Heavy metals, *Bioindicators, Model studies, Copper, Zinc, Lead, Pollutant identification, Statistical models, Metals, Regression analysis, Water analysis, Trace metals, British Columbia, Seawater.

Field studies of copper, zinc, and lead concentrations in seawater and mussels were used to develop statistical models for estimating concentrations of trace metals in seawater, knowing the concentrations of metals in mussels. This model accounted for 50% of the variance of the soluble metal and about 20% of the metal as suspended particulate matter. Low concentrations of metals in seawater were consistently overestimated and high values, underestimated. Over 700 mussels and 25 seawater samples were collected in the southeastern coastal waters of British Columbia. These models can probably be improved by adding parameters which reflect the instantaneous effects of salinity and turbidity. (Cassar-FRC)

STREAM MACROINVERTEBRATE BASELINE SURVEYS: A COMPARATIVE ANALYSIS FROM THE OIL-SHALE REGIONS OF COLORADO, USA,

California Univ., Berkeley. Dept. of Forestry and Resources Management.
D. C. Erman.
Environmental Management, Vol 5, No 6, p 531-536, November, 1981. 2 Fig, 3 Tab, 18 Ref.

Descriptors: *Macroinvertebrates, *Oil shale, *Colorado, Streams, *Baseline studies, *Mining wastes, Resources development, Environmental effects, Ecosystems.

General surveys of the benthic macroinvertebrates from Piceance Creek and the White River have been conducted for nearly a decade prior to oil shale exploitation in north central Colorado. The taxa collected in four studies on Piceance Creek and in five studies on the White River showed in comparison studies that there was little similarity in results between studies, even though the studies were generally consistent in methodology, site selection, and time of year that collection of samples was made. It is suggested that this lack of agreement among the studies on what constitutes a baseline of common taxa in this area is probably a result of taxonomic difficulties and differences in technique. More emphasis should be placed on testing possible impacts than on repeated, expensive, and inconclusive baseline inventories. At present it would be impossible to identify the effects of oil-shale development, even though four or five separate studies were performed during most of a yearly cycle. (Baker-FRC)

MICROBIOLOGICAL QUALITY OF SELECTED RECREATIONAL WATERS,

Florida Univ., Gainesville. Dept. of Food Science and Human Nutrition.
R. J. Alvarez.
Environmental Research, Vol 26, No 2, p 372-380, December, 1981. 3 Tab, 21 Ref.

Descriptors: *Public health, *Water quality, Water use, Lakes, Streams, Rivers, Ponds, *Bacterial analysis, Pathogens, Microorganisms, Recreation, *Microbiological studies, *Florida.

The microbial quality of 18 recreational waters was evaluated in north-central Florida. These waters included lakes, streams, ponds, and creeks. Total bacterial and fungal counts, total and fecal coliforms, temperature, and pH were monitored in the summer of 1979 and winter of 1980 to observe

any seasonality associated with the quality and safety of the recreational waters. Since preliminary work had suggested the presence in various waters of lesser pathogens, five were monitored using plate count agar during the current study: Serratia marcescens, Pseudomonas aeruginosa, Yersinia enterocolitica, Edwardiella tarda, and Chromobacterium violaceum. Temperature, pH, and bacterial, fungal, total and fecal coliform counts decreased in all winter samples. However, the distribution of the selected pathogenic microorganisms seemed affected during the winter. Forty-four percent of all the recreational water sampled during the entire study contained S. marcescens, 50% contained P. aeruginosa, 56% C. violaceum, and 11% Y. enterocolitica. No E. tarda was recovered during this study. The presence of high levels of fecal coliforms and the isolation of various pathogenic microorganisms in the various waters indicates a need for closer monitoring. (Baker-FRC)

TRACE ANALYSES FOR WASTEWATERS,

Environmental Monitoring and Support Lab., Cincinnati, OH.
J. A. Glaser, D. L. Foerst, G. D. McKee, S. A. Quave, and W. L. Budde.
Environmental Science and Technology, Vol 15, No 12, p 1426-1435, December, 1981. 5 Tab, 31 Ref.

Descriptors: *Trace levels, *Detection limits, *Wastewater analysis, Performance evaluation, *Pollutant identification, Standard deviation, Chemical analysis, Error analysis, Detection limits, Aromatic compounds, Organic compounds, Hydrocarbons, Pesticides, Chlorinated hydrocarbons, Polychlorinated biphenyls, Insecticides, Benzidenes, Dioxin, Polynuclear aromatic hydrocarbons.

The method detection limit (MDL) is defined as the concentration of the analyte that can be detected at a given confidence level. The definition implies that, on the average, 99% of the trials measuring the analyte concentrations at the MDL must be significantly different from zero analyte concentration. MDL may be depicted as an error distribution. A procedure for determining the MDL with samples is described. The estimate may be tested by spiking the samples at the calculated MDL and repeating the procedure. Tables list MDL data on various analytical methods for organic priority pollutants in wastewater: purgeable aromatics, 0-0.4 micrograms per liter; benzidines, 0.08-0.22 micrograms per liter; organochlorine pesticides and polychlorinated biphenyls, 0.002-0.262 micrograms per liter; polycyclic aromatic hydrocarbons, 0.01-4.0 micrograms per liter; dioxin, 2 ng per liter; and miscellaneous organic compounds. The MDL varies with the analyst, method, composition of wastewater, and analyte. If the relative standard deviation of 7 replicates is 20.5-70.1%, the estimated MDL will be within the 95% confidence level of the calculated MDL. If the relative standard deviation is about 10%, the calculated MDL values can be below instrumental detection limits. (Cassar-FRC)

CONTIUOUS, AUTOMATED, AND LOW-COST MONITORING OF THE ORGANIC CONTENT IN WATER,

Life Systems, Inc., Cleveland, OH.
R. J. Davenport, R. A. Wynveen, and W. J. Cooper.
Journal of the American Water Works Association, Vol 73, No 10, p 555-558, October, 1981. 10 Fig, 8 Ref.

Descriptors: *Water quality, *Monitoring, *Organic compounds, Measuring instruments, Chemical analysis, Water analysis, Electrochemistry, Chemical reactions.

The electrochemical organic content (EOC) analyzer has been shown to be sensitive to individual organic compounds found in water. At present, however, the use of the EOC analyzer is in the experimental phase. The potential exists to apply the analyzer both to monitoring and to controlling operations in water treatment plants. Six organic compounds were selected for use during the feasibility demonstration of the EOC analyzer: acetic acid, methanol, urea, acetone, phenol, and a high-molecular-weight, nonionic surfactant, Triton X-100. The optimum electrode potentials and time periods for the electrode preconditioning sequence were selected on the basis that the optimum conditions would produce maximum interfacial capacitance values at the adsorption potential, without evolving excessive amounts of oxygen and hydrogen. Many organic compounds or classes of compounds exhibit a maximum adsorption at a particular potential. Therefore by lowering the adsorption potential from 0.65 to 0.25V, the methanol response is increased five times and the resultant lower limit of detection is about 2 mg/liter total organic carbon. The fact that all organic compounds do not adsorb equally can be used to advantage in detecting and monitoring certain strongly adsorbing organics when they coexist with other, less strongly adsorbing organics. Another possible use for the EOC analyzer would be monitoring water quality throughout a treatment plant. (Baker-FRC)

ION EXCHANGE IN FLOW INJECTION ANALYSIS DETERMINATION OF AMMONIUM IONS AT THE MICROGRAM PER LITER LEVEL IN NATURAL WATERS WITH PULSED NESSLER REAGENT,

Centro de Energia Nuclear na Agricultura, Sao Paulo (Brazil).
F. H. Bergamin, B. F. Reis, A. O. Jacintho, and E. A. G. Zagatto.
Analytica Chimica Acta, Vol 117, p 81-89, June, 1980. 7 Fig, 2 Tab, 12 Ref.

Descriptors: *Ammonium, *Water analysis, Chemical analysis, *Ion exchange, Resins, Flow system, Wastewater analysis.

Conditions for the use of ion exchangers in flow injection systems were investigated in order to develop a method for the determination of ammonium ions in natural waters at the microgram per liter level. A resin column is employed in the sample loop of an electronically operated proportional injector. Effects of sample aspiration, sampling time, eluting agent concentration, pumping rate of the sample carrier stream, resin column size, and sample acidity were studied. Consideration was also given to the possible use of sample buffering before the adsorption step. The proposed method is characterized by a precision of about two percent, a sampling rate of about 40 samples per hour, and a reagent consumption of 40 microliters per sample, and is almost free of interferences. Recoveries from 95 to 105 percent were achieved in analyzing rainwater samples with ammonium contents of less than 200 micrograms per liter. For determinations of ammonium ion in other materials such as soil extracts or wastewaters, a system with a distillation unit can be used. The system can be used for other ions in conjunction with colorimetry, potentiometry, and atomic absorption spectrometry. (Baker-FRC)

CADMIUM IN AN AQUATIC ECOSYSTEM,

New York Univ., NY. Dept. of Environmental Medicine.
R. E. Hazen.
PhD Thesis, February, 1981. 148 p, 28 Fig, 22 Tab, 63 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-15552.

Descriptors: *Water pollution effects, *Cadmium, *Ecosystems, *Sediments, Toxicity, Heavy metals, Aquatic animals, Hazards, *Foundry Cove, Tidal effects, Hudson River, *New York.

Discharge of cadmium into Foundry Cove on the Hudson River from 1953 to 1970 accompanied the production of nickel-cadmium batteries at a nearby plant in Cold Spring, New York. The sediment surrounding the point of discharge was heavily contaminated. It was the purpose of this study to investigate the physical distribution and biological availability of the cadmium in Foundry Cove. Sediment, water and biota samples were collected and analyzed for cadmium. Laboratory exposures were conducted with fish to determine both rate of uptake and the significance of possible routes of exposure. Nine metric tons of cadmium were estimated to be in the cove sediment. Water samples typically contained from 5 to 15 micro gram Cd/liter. Animal and plant tissue samples were found to be elevated in cadmium compared to control areas. The predominant route of exposure to fish in the cove is believed to be via ingestion rather than uptake of cadmium from water through the gill. The major portion of the cadmium contamination was incorporated in the sediments with very limited availability to the water column. Nevertheless, significant elevations in cadmium concentrations were found in plants and animals in the cove. Cadmium in the blue-clay crab taken from the cove was found to be in a sufficient concentration to be a possible human health hazard. (Sinha-OEIS)
W82-03724

DEVELOPMENT OF HEALTH EFFECTS CRITERIA FOR FRESHWATER BATHING BEACHES BY USE OF MICROBIAL INDICATORS,

Oklahoma Univ., Norman.
G. L. McKee.
PhD Thesis, 1980. 219 p, 3 Fig, 18 Tab, 94 Ref, 7 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-16930.

Descriptors: *Water quality standards, *Bioindicators, *Public health, Recreation, Swimming, Pollutant identification, *Epidemiology, Escherichia coli, Microbiological studies, Oklahoma bathing beaches, Freshwater, Enterococcus, Symptomatology, *Lake Keystone.

An epidemiological-microbiological study was conducted at Lake Keystone, Oklahoma, near Tulsa, to help develop recreational water quality criteria based upon health effects. Symptomatology rates among swimmers relative to non-swimmer controls were examined at a 'barely acceptable' (BA) beach, Salt Creek Noth (I), and Keystone Ramp (II), and a 'relatively unpolluted' (RU) beach at Washington Irving South (III). This was accomplished by contacting family groups at the beaches on weekends and obtaining information on bathing activity by the use of interviewers. These beach-goers were questioned by telephone 8-10 days later concerning heath related symptoms. Measurements were made for a number of potential microbial indicators of pollution during the time the interviews were being made. When the data from the BA and RU beaches was examined, the symptom rates categorized as gastrointestinal, respiratory and 'other' were higher among swimmers than non-swimmers. Although the data were not statistically significant, definite trends could be shown in that direction. Good agreement was obtained between geometric means of Escherichia coli and enterococcus densities and the differential (swimmers minus non-swimmers) rate of gastrointestinal symptoms. The objective of relating illness as measured by symptomatology to an indicator of water quality has been addressed. (Sinha-OEIS)

5B. Sources Of Pollution

MINERAL ELEMENT CONTENT IN ULVA LACTUCA L. WITH REFERENCE TO EUTROPHICATION IN HONG KONG COASTAL WATERS,

Hong Kong Univ., Dept. of Botany.
Y. B. Ho.
Hydrobiologia, Vol 77, No 1, p 43-47, 1981. 1 Fig, 3 Tab.

Descriptors: *Algae, *Bioindicators, *Eutrophication, Chlorophyta, Indicators, Ulva lactuca, *Hong Kong, Nitrogen, Phosphorus, Pollutant identification, Fate of pollutants, *Coastal waters.

The green algae Ulva lactuca collected from sewage-contaminated urban sites in marine waters around Hong Kong Island were higher in tissue N

and P (44.9 and 2.7 mg per g dry weight, respectively) than algae from relatively non-polluted rural sites (27.13 and 1.45 mg per g dry weight, respectively). The mean inorganic N and soluble reactive P (in micrograms per cu dm) in seawater were as follows: urban sites, 162 and 37, respectively; rural sites, 12 and 6, respectively. There was a significant, positive correlation between the logarithmic concentration of soluble reactive P in seawater and tissue P. Levels of K and Na in the algal tissue were relatively uniform. Iron varied widely, being generally more concentrated in algae and water from urban sites. Ulva is potentially a good bioindicator for eutrophication and for heavy metal pollution. (Cassar-FRC)

A WET-WEATHER MODEL FOR EVALUATING THE COMBINED EFFECTS OF STORM-SEWAGE OVERFLOWS AND SEWAGE-WORKS' EFFLUENTS UPON RIVER QUALITY,

Yorkshire Water Authority, Sheffields (England). Southern Div.
D. M. V. Aspinwall.
Water Pollution Control, Vol 80, No 3, p 398-410, 1981. 10 Fig, 2 Tab, 5 Ref.

Descriptors: *Combined sewer overflow, *Storm-overflow sewers, Overflow, Storm sewers, Sewers, Storm drains, Storm wastewater, *Model studies, Mathematical models, Rivers, Water quality, Water pollution sources.

A simple mathematical model is described which examines the way in which the diluting effect of rainwater upon crude sewage affects river pollution caused by storm sewage overflow discharges. The model also allows the input of sewage-treatment works final effluent and storm-sewage tank effluent so that a complete picture can be formed of the combined effects of all these discharges upon river quality. The relevance of the model output is discussed in relation to common problems such as storm-sewage overflows which discharge prematurely, rivers affording little dilution and rivers which are affected by upstream pollution. The application of the model is described for the Sheffield drainage area. In general the river dilution here is low, storm overflow settings are low, and it is to be expected that quite high levels of pollution will occur. The model is based upon steady state conditions, and a sufficient period is required to have elapsed from the start of rainfall for these conditions to be reached. The period required is a function of the time of concentration of the sewerage system together with the flow characteristics of the receiving watercourse. For small drainage areas the period will be short. For larger areas the period will be longer. Storms of short duration will produce lower levels of pollution than are predicted by the model. The situations in which it would be desirable to implement policies of separation of combined sewerage systems are those highest in storm-sewage overflows causing excessively high levels of stream pollution. If separation is unlikely, the effect of providing increased sewer capacity together with higher settings of storm sewage overflows and off line storage tanks should be investigated. Schemes for works abandonment and regionalization should be viewed cautiously, as they may lead to situations in which longer sections of the river become polluted. (Baker-FRC)

OUTBREAKS OF WATERBORNE DISEASE IN THE UNITED STATES: 1971-1978,

Health Effects Research Lab., Cincinnati, OH.
G. F. Craun.
Journal of the American Water Works Association, Vol 73, No 7, p 360-369, July, 1981. 10 Fig, 9 Tab, 22 Ref.

Descriptors: *Human diseases, *Drinking water, *Water distribution, Municipal water, Water quality, Contamination, Public health.

Outbreaks of waterborne disease associated with water used for drinking purposes are discussed for 1971 through 1978. Forty-three states and Puerto Rico reported 224 outbreaks which affected 48,193 individuals, two of whom died. Outbreaks in municipal and community systems naturally affected the largest number of people. These were generally caused by contamination of the distribution system, primarily through cross connections and backsiphonage. Five thousand cases of acute gastroenteritis were thought to be caused by the contamination of an uncovered storage reservoir, and 1400 cases of a similar illness were traced to sewage contamination of a water main under construction. The use of untreated, contaminated groundwater and treatment deficiencies were the primary sources of waterborne disease outbreaks in semipublic or noncommunity systems. Treatment deficiencies were responsible for 33% of all outbreaks. The number of reported outbreaks has been increasing in the United States, but this is attributed to improved surveillance. INTERSTATE HIGHWAYS VERSUS WATERSHED PROTECTION IN NEW ENGLAND,

Jordan (Perkins), Inc., Reading, MA.
W. R. Adams, Jr.
Journal of the American Water Works Association, Vol 73, No 7, p 346-349, July, 1981.

Descriptors: *Watershed management, *Highway effects, *Road construction, Highways, Highway relocation, Runoff, Drinking water, Water quality, Water pollution sources, *New England.

The quality of drinking water supplies is threatened by the construction and use of interstate highways. The construction process may encourage erosion, which can add large quantities of turbid water to a reservoir. Runoff which occurs after other toxic spills that result from highway accidents are a third source of contamination. In addition, interstate highways spur further development, including shopping centers, more streets, and increases in housing construction. An example is presented of the environmental impact of a planned interstate on the Scituate Rreservoir near Providence, Rhode Island. When interstates are constructed outside of watersheds, problems associated with construction and operation are prevented and traffic is taken off the roads within the watershed. This practice is in keeping with the basic New England philosophy that every effort should be made to protect drinking water sources from further degradation. (Small-FRC)

IF YOUR CITY'S WELL WATER HAS CHEMICAL POLLUTANTS, THEN WHAT,

A. Morrison.
Civil Engineering (New York), Vol 51, No 9, p 65-67, September, 1981. 1 Fig.

Descriptors: *Groundwater pollution, *Organic solvents, Solvents, Glen Cove, *New York, Rockaway, *New Jersey, Aeration, Adsorption, Water pollution sources, Activated carbon, Potable water, Wells, Well water, Organic compounds, Trichloroethylene.

The major organic pollutants found in groundwaters are organic solvents; the most common of these are trichloroethylene and 1,1,1-trichloroethane. Recent samplings have revealed solvent contamination of groundwaters in Massachusetts, Connecticut, New Hampshire, New York, New Jersey, Delaware, Rhode Island, Pennsylvania, Florida, Michigan, and California. Other solvents that have been identified in groundwater include vinyl chloride, 1,2-dichloroethane, tetrachloroethylene, cis-1,2-dichloroethane, and carbon tetrachloride. Possible sources for these contaminants include industrial discharges, leachate from improperly managed landfills, septic tank degreasers and similar products used in individual households, sewer leaks, accidental spills, and leaks. Conventional water treatment such as coagulation, settling, precipitative softening, filtration, and perhaps disinfection are ineffective in removing most solvents. Both aeration and adsorption, however, have been found effective in decreasing concentrations of many of these contaminants. The two major adsorption methods used for this purpose are granular activated carbon and a synthetic carbon-based resin called Ambersorb XE-340. Aeration techniques found effective include packed column aeration, small cooling towers, and diffused aeration. A combination of adsorption and aeration is under study. Specific emergency situations are considered, including that in Rockaway Township, New Jersey, which is beset by pollution from two distinct sources, and Glen Cove, New York. (Baker-FRC)

ROCKY MOUNTAIN ARSENAL: LANDMARK CASE OF GROUNDWATER POLLUTED BY ORGANIC CHEMICALS, AND BEING CLEANED UP.

Civil Engineering (New York), Vol 51, No 9, p 68-67, September, 1981. 3 Fig, 1 Tab.

Descriptors: *Groundwater pollution, *Organic compounds, Water pollution, *Rocky Mountain Arsenal, Deep wells, Wastewater treatment, Poisons, Toxicity, Hazardous materials, *Chemical wastes.

In the 1940s chemical wastes were dumped at the Rocky Mountain Arsenal. Dumping techniques were not very sophisticated at that time, involving only placing a small dam across a low place on the Arsenal grounds, adding lime to stabilize the waste, and dumping the waste behind the dam. A problem was evident in the 1950s, when nearby crops irrigated with groundwater that had flowed under the Arsenal were damaged. Groundwater and contamination surveys were conducted, along with engineering studies, which in 1957 resulted in the construction of an asphalt-lined basin into which the above-ground liquid wastes were pumped. By the 1960s the asphalt-lined basin proved insufficient to handle all liquid wastes, so some were deep well injected into geologic strata underlying Denver. When earthquakes were detected in the Denver region, the deep well injection program was stopped. At this point the earthquakes also stopped. In 1975 the problem was taken over by the Toxic and Hazardous Materials Agency, Aberdeen Proving Ground, Maryland. Subsequently, wells have been drilled on the Arsenal grounds and used to check groundwater quality; quantity and direction of groundwater flow is being monitored; new technologies for waste treatment and control have been studied; a pilot slurry wall was constructed underground to intercept some of the groundwater flow before it leaves the Arsenal; and the intercepted flow is pumped out, run through granular activated carbon beds, and the cleansed water returned to the ground via other wells downflow of the wall. A team of specialists is now being assembled to help determine the most cost-effective alternatives for addressing the total contaminant problem. (Baker-FRC)

PALAEOECOLOGICAL STUDIES OF THE RECENT DEVELOPMENT OF LAKE VAXJOSJON. III. REASSESSMENT OF RECENT CHRONOLOGY ON THE BASIS OF MODIFIED PB210 DATES,

University Coll., London (England).
R. W. Battarbee, G. Digerfeldt, P. Appleby, and F. Oldfield.
Archiv fur Hydrobiologie, Vol 89, No 4, p 440-446, August, 1980. 2 Fig, 2 Tab, 10 Ref.

Descriptors: *Sedimentation, *Lead, *Dating, *Lake sediments, Paleolimnology, Deposition, *Fate of pollutants, Lake Vaxjoajon.

Dates of lead pollution in sediments in Lake Vaxjoajon were recalculated using the assumption of a constant net rate of supply (c.r.s.) of unsupported Pb210 to the sediment. Dates had previously been determined on the assumption that there was a constant initial concentration (c.i.c.) of unsupported Pb210 per unit dry weight of sediment at each sampled depth. For the eight samples down to the 140 cm depth (1880) there was reasonably good agreement between the two calculation methods, suggesting a rather uniform dry mass accumulation rate during this period. The last two samples, 155-160 cm and 175-180 cm, were dated 1898 and 1875, respectively, by the c.i.c. method and 1868 and 1786, respectively, by the c.r.s. method. Sediment accumulation rates determined by the c.r.s. method (0.148 g per sq cm per a) correlated better with historical evidence such as dredging, lake lowering, and pollution inputs than rates determined by c.i.c. (0.135 g per sq cm per a). (Cassar-FRC)

DEGRADATION OF PENTACHLOROPHENOL IN SIMULATED LENTIC ENVIRONMENT,

Fish and Wildlife Service, Columbia, MO.
T. P. Boyle, E. F. Robinson-Wilson, J. D. Petty, and W. Weber.
Bulletin of Environmental Contamination and Toxicology, Vol 24, No 2, p 177-184, 1980. 1 Fig, 3 Tab, 23 Ref.

Descriptors: *Biodegradation, *Aquatic environment, *Ecosystems, *Aerobic bacteria, *Phenols, Organic compounds, Euphotic zone, Zones, Water pollution, Benthic environment, Benthos, Experimental design, Gas chromatography, Lentic environment, Standing waters.

The persistence of pentachlorophenol (PCP) in various aquatic environments was investigated. Four aquaria were established, simulating four lentic environments: the oxygen rich epilimnion, the oxygen rich euphotic littoral zone, and low oxygen, dark hypolimnion, and a benthic hydrosoil-hypolimnion. The degradation of PCP, formation of TCP and PCA, and the distribution of metabolites were observed over a 131 day period. Results suggest that the persistence of PCP was associated with three variables: (1) the absence of light and hydrosoil, (2) a pH near or below the pka of 4.8, and (3) low oxygen concentration. The conversion of PCP to TCP does not appear to be the major pathway in water, but may be more important in hydrosoil. (Titus-FRC)

Descriptors: *Trace metals, *Food chains, *Estuaries, Bioaccumulation, Heavy metals, Metals, Crustaceans, Fish, Loire, *France, Path of pollutants.

Different species of crustaceans and fish were taken from the Loire estuary on the banks of Bilho and Pipy to determine the behavior of some trace elements (Cd, Pb, Cu, Zn) in estuarine biota. Except for Zn, the accumulation of metals was higher in crustaceans than in fishes, which was particularly pronounced for Cu, a constituent of the crustacean respiratory pigment hemocyanine. The metal concentrations, determined by atomic absorption, were no greater in bottom-feeders than for other fish, indicating that metal transfer from sediments was unimportant. Biological accumulation decreased in the order Zn > Cu > Pb > Cd. The Loire organisms were generally less contaminated than those of the same species taken from heavily polluted estuaries (Severn and Medway, England). Transfers in food chains were determined with the transfer factor, equal to the ratio of the predator concentration to the prey concentration. There was no indication of any biomagnification in food chains for Cd, Pb and Cu, since the amounts observed in the predators were generally less than those of prey or in the digestive content. For Zn the transfer factor was > 1 with one exception (Neyomysis integer - Crangon crangon). The higher concentrations in the intestines than in the stomach were probably due to feces enrichment by unassimilated metals. (Hertzoff-FRC)

Descriptors: *Lakes, *Arsenic, *Water pollution, Pollutant identification, Water pollution sources, Aquatic weed control, Sediments, *Lake Lansing, *Michigan.

Lake Lansing, Michigan was treated with sodium arsenite for control of aquatic macrophytes in 1957. The rate of decrease in recently deposited sediments predicted that concentrations near background would exist in surficial sediments in the deep portions of the basin by 1989. One hundred ten samples of the upper 7 cm of littoral sediments were taken along transects. Concentrations two to six times background occurred over 85-90% of the sediment surface. An arsenic mass balance budget was constructed for the lake for the interval June 1978 to June 1979. This showed that the lake lost more arsenic than it received annually. A laboratory experiment was conducted to obtain predictions of arsenic expected in the lake as a result of interactions between contaminated sediments and the water column. Since sediments in the well aerated littoral, as well as those from the periodically anaerobic hypolimnion were contaminated, aerobic and anoxic treatments were compared. It appears that As(V) and phosphate compete for iron as anoxic systems are aerated. Concentrations of arsenic observed in the lake fit expectations from the experimental work. Currents associated with summer storms periodically erode the metalimnion of this shallow lake. Except for infrequent summer periods, sulfide or ferric iron tend to limit total arsenic in the hypolimnion. (Sinha-OEIS)

METHANOGENESIS IN MARINE SEDIMENTS OF THE MISSISSIPPI RIVER DELTA,

Louisiana State Univ., Baton Rouge. Dept. of Microbiology.
L. A. Hook.
PhD Thesis, May, 1981. 167 p, 30 Fig, 9 Tab, 83 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-17631.

Descriptors: *Methane, *Sediments, *Bacteria, *Deltas, Anaerobic conditions, Sulfur bacteria, Environmental effects, Microbiological studies, *Mississippi River, *Methanogenesis, Marine sediments, Sulfate-reducing bacteria.

The final processes of carbon mineralization in anaerobic sediments are chiefly governed by two groups of strictly anaerobid microorganisms: sulfate-reducers and methanogens. The highest most probable numbers (MPNs) of methanogens and sulfate-reducers in unstable, gas-rich, Mississippi River delta sediments occurred together in samples taken 0.2 m below the sediment-water interface. The presence of sulfate-reducers was directly related to dissolved sulfate in the interstitial water. Dissolved methane in the sediments was inversely related to the presence of sulfate-reducing bacteria. The extensive depth distributions of methanogens and sulfate-reducers, plus the occurrence of two sulfate-reducing zones, were the result of sediment mixing during undersea landslides that frequently occurred in the delta. Methanogenesis was sensitive to 2-bromoethanesulfonate, chloroform, nitrate, air, and formaldehyde, but not to added Beta-fluoroacetate, sulfide, or sulfate. The optimum temperature for methanogensis in enrichments and in unadulterated sediments was 35-40 C and 45 C, respectively. The production of methane from choline, in addition to the isolation of desulfovibrios capable of producing trimethylamine from choline, implicated trimethylamine as a possible methane precursor in the delta sediments. DEGRADATION OF POLYCHLORINATED BIPHENYLS IN SEDIMENTS OF THE GREAT LAKES,

Michigan Univ., Ann Arbor. Dept. of Environmental and Water Resources Engineering.
M. L. Anderson.
PhD Thesis, 1980. 275 p, 59 Fig, 24 Tab, 162 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-25646.

Descriptors: *Polychlorinated biphenyls, *Sediments, *Degradation, *Microbial degradation, Experimental data, Aeration, Bacteria, Chemical properties, Water quality, Fate of pollutants, *Great Lakes, Saginaw Bay.

The central hypothesis of this research is that microbial degradation of PCBs in the Great Lakes might be significant. Because of the long residence time of PCBs in the Great Lakes, this removal mechanism could be significant even if the rate of degradation is slow. Some conclusions reached are: Bacteria exist in sediments of Saginaw Bay and River which are capable of degrading chlorobiphenyls at rates which are significant. The degradation of chlorobiphenyls in incubated sediments is enhanced by aeration and mixing of the system. The degradation of di- and trichlorobiphenyls is extremely rapid in incubated sediments. Tetra and pentachlorobiphenyls are also degraded but at slower rates. The rate of degradation of 2, 4, 5, 2', 5'-pentachlorobiphenyls has a significant impact upon simulated Aroclor 1254 concentrations in Saginaw Bay. None of the chlorobiphenyls employed were degraded in sediments incubated under anaerobic conditions. And finally, degradation of chlorobiphenyls in the Great Lakes appears to take place predominantly in the aerobic surface layer of sediments. (Sinha-OEIS)

ACIDIFICATION OF SURFACE WATERS IN TWO AREAS OF THE EASTERN UNITED STATES,

Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
D. A. Burns, J. N. Galloway, and G. R. Hendrey.
Water, Air, and Soil Pollution, Vol 16, No 3, p 277-285, October, 1981. 2 Tab, 32 Ref.

Descriptors: *Acidic water, *Streams, *Acid rain, *New Hampshire, *North Carolina, Blue Ridge Mountains, White Mountains, Hydrogen ion concentration, Alkalinity, Surface waters, Lakes, Air pollution, Water pollution sources.

Some acidification of surface waters has occurred in 2 undisturbed, upland watersheds in New Hampshire's White Mountains and North Carolina's Blue Ridge Mountains. The New Hampshire waters had a pH of 6.06 in 1979 vs. 6.66 in 1936-39. The North Carolina waters declined in pH from 6.77 in 1961-64 to 6.51 in 1979. Recent determinations of Ca, Mg, Na, and K were compared with bicarbonate alkalinity. The current ratios of bicarbonate alkalinity to the sum of the base cations were 0.312 for New Hampshire and 0.562 for North Carolina. These may be compared with ratios from western lakes receiving no acid precipitation (0.776-0.942) and some acid lakes in Connecticut (0.333), Maine (0.427), and Scandinavia (0.064). Acidification was more pronounced in New Hampshire waters, corresponding with historical data that New Hampshire has been receiving precipitation of average annual pH below 4.5 since at least 1955, whereas North Carolina precipitation in 1955 had a pH of 4.7-5.2, and in 1963, 5.0. ANALYTICAL SOLUTIONS FOR TRANSPOT OF CONSERVATIVE AND NONCONSERVATIVE CONTAMINANTS IN GROUNDWATER SYSTEMS,

Instituut voor Culturrtechniek en Waterhuishouding, Wageningen (Netherlands).
J. Hoeks.
Water, Air, and Soil Pollution, Vol 16, No 3, p 339-350, October, 1981. 4 Fig, 1 Tab, 6 Ref.

Descriptors: *Solute transport, *Waste disposal, Model studies, *Path of pollutants, *Groundwater pollution, Leachates, Landfills, Groundwater movement, Adsorption, Degradation, Water quality, Zinc, Ammonium, Chlorides, Organic compounds.

A simple model for contaminant transport in groundwater is developed to help select sites for waste disposal. Data needed are soil profile, hydrologic parameters, and soil interaction processes (adsorption, decomposition). Equations describing the flow of groundwater along streamlines are combined with equations for interaction processes. Dispersion is neglected. An example is given where a waste tip (200 m in diameter) is in an area of divergent radial groundwater flow with concentric equipotential lines. Infiltration into upper soil and aquifer is 200 mm per year. After 30 years ammonium and Zn have been retarded; organic compounds have been degraded within 100 m. Vertical penetrations are 21 m for Cl, 17 m for ammonium, 2.6 m for Zn, and 10 m for organic compounds. (Cassar-FRC)

Descriptors: *Nutrients, *Fertilizers, *Agricultural runoff, Fate of pollutants, Agricultural watersheds, Nitrogen, Phosphorus, Potassium, *Oka Valley, *USSR, Rivers.

Concentrations of nitrogen, phosphorus, and potassium were measured in the rivers and principal tributaries of the Oka Valley, near Moscow, from July 1977 to March 1980, with simultaneous estimation of the water discharge. Nutrient losses in the four tributary valleys of the Oka Valley were highly correlated with the amounts of mineral and organic fertilizers applied to the soil. The four valleys differed in rate and timing of fertilizer application, soil type, crops, and erosion characteristics. Nutrient losses were also higher in regions with greater natural soil fertility, greater erosion, and light-textured soils, and in the flood season. (Cassar-FRC)

SULFUR CONTITUENTS OF SEDIMENTS AND THEIR RELATIONSHIP TO LAKE ACIDIFICATION,

State Univ. of New York Coll. of Environmental Science and Forestry, Syracuse. Dept. of Environmental and Forestry Biology.
M. J. Mitchell, D. H. Landers, and D. F. Brodowski.
Water, Air, and Soil Pollution, Vol 16, No 3, p 351-359, October, 1981. 3 Fig, 3 Tab, 35 Ref.

Descriptors: *Lake sediments, *Sulfur compounds, *Acid rain, Fate of pollutants, Sediments, Acidic water, Sulfates, Decomposition, Lakes, Oneida Lake, Deer Lake, South Lake, *New York, Water pollution effects.

The organic and inorganic sulfur fraction in 3 New York lake sediments were determined. These lakes, subjected to acid precipitation, differed in buffering capacity and pH. pH and acid neutralizing capacity (in meq per liter) respectively were: Oneida, 7.2-9.4 and 1700; South, 4.9-6.5 and 2-10; and Deer, 5.9-6.8 and 90-124. Total sulfur in sediments was lowest in Oneida (0.1-0.3% dry mass). South (0.25-0.65%) and Deer (0.3-0.5%) sediments had higher S levels near the outlets. Sulfides were highest in Oneida (1% of total S) which had the lowest redox potential (-80 to -110 mV). South and Deer contained about 0.2% sulfides. Inorganic S varied from 8% of total S in Deer to 22% in Oneida. Ester sulfates were 80% of total S in Oneida and Deer, and 45% in South. Oxygen consumption was highest in Oneida and lowest in South sediments. The low ester sulfate and higher carbon/nitrogen ratio in South sediments suggest that lake acidification may inhibit decomposition. (Cassar-FRC)

BOTTOM SEDIMENTS AS A SOURCE OF NITROGEN AND PHOSPHORUS IN WATER,

Akademiya Nauk SSSR, Borok. Inst. Biologii Vnutrennykh Vod.
M. V. Martynova.
Water Resources, Vol 8, No 1, p 91-106, January/February, 1981. 2 Fig, 8 Tab, 58 Ref. Translated from Vodnye Resursy, No 1, p 164-182, January/February, 1981.

Descriptors: *Nitrogen removal, *Phosphorus removal, *Sediments, Fate of pollutants, Bottom sediments, *Lake sediments, Nutrients, Eutrophication, Reviews, Adsorption, Phosphates, Ammonium compounds, Model studies, Clays, Chemical reactions.

Literature on bottom sediments and their release of nutrients into the water is reviewed with emphasis on publications of the 1970's. This stage of the investigations is concerned with the role of sediments in the prediction and regulation of water quality, mainly phosphorus levels. Two methods of investigation are common: aquarium experiments and on-site observations. Several factors influence the exchange of N and P between sediments and water. Anaerobic conditions promote P mobilization. Phosphate concentrations greater than 1-2 mg per liter are readily adsorbed into sediments under both aerobic and anaerobic conditions. Oxygen levels do not affect the rate of removal of ammonium N from sediments. Maximum phosphate adsorption takes place at lower pH (4-5) on kaolinite and illite, at higher pH (10+) on montmorillonite, and in clays with higher Fe content. Both P and N removal are greater at higher water temperatures and at higher microbial activity levels. Models describing P and N exchange in sediments are based on mechanisms or on experimentally determined relationships between the release rates of N and P-containing compounds and their content in the sediment. Concentration diffusion is the main method of passage of N from sediments into water. The P removal mechanism is more complex, and not all the processes are completely understood. (Cassar-FRC)

PERSISTENCE OF DIELDRIN IN WATER AND CHANNEL CATFISH FROM THE DES MOINES RIVER, IOWA, 1971-73 AND 1978,

Minnesota Pollution Control Agency, Roseville.
S.-Y. T. Leung, R. V. Bulkley, and J. J. Richard.
Pesticides Monitoring Journal, Vol 15, No 2, p 98-102, September, 1981. 2 Fig, 5 Tab, 15 Ref.

Descriptors: *Fate of pollutants, *Dieldrin, *Catfish, *Water pollution effects, Bioaccumulation, Pesticides, *Insecticides, Water pollution, Rivers, Aldrin, Environmental effects, Ecological effects, Runoff.

The levels of the organochlorine insecticide, dieldrin, in the Des Moines River, Iowa and in channel catfish (Ictalurus punctatus) from the river were compared based on studies done before and after the banning of the parent pesticide aldrin by the Environmental Protection Agency in 1975. In river water, the mean June levels of dieldrin decreased from 50 parts per trillion (ppt) in 1971 to 11 ppt in 1978. In 1971 the average daily transport of dieldrin was 156 g, as compared to a value of 70

g in 1978. Average levels of dieldrin in catfish muscle recorded in July were 75 parts per billion (ppb) in 1973 and 46 ppb in 1978. Three years after the registration of the parent compound aldrin was withdrawn, dieldrin was still found at significant levels in the Des Moines River. The long half-life of this chemical under certain environmental conditions indicates that dieldrin will be present in the river for some years. (Geiger-FRC)

FIELD OBSERVATIONS OF FRONTS AND HIGH-FREQUENCY TEMPERATURE FLUCTUATIONS IN A THERMAL PLUME,

Wisconsin Univ.-Madison. Marine Studies Center.
T. Green, and S. Roffler.
Advances in Water Resources, Vol 4, No 3, p 137-145, September, 1981. 16 Fig, 1 Tab, 18 Ref.

Descriptors: *Plumes, *Thermal water, *Nuclear powerplants, Thermal pollution, Temperature gradient, Powerplants, Outfall, Turbulent flow, Cooling water, *Lake Michigan, Mixing, Flow pattern, Fate of pollutants.

High frequency temperature variations were measured at seven depths 130 meters from the cooling water outfall of the Point Beach Nuclear Plant on Lake Michigan. Techniques used to analyze the data included temperature spectra, correlation functions, and probability distributions. Sharp, concentric thermal fronts observed in the data compare with those obtained from aircraft infrared imagery and to laboratory studies of instabilities in maxing layers between uniformly flowing and quiescent liquids. This work gives firm evidence of the existence of mature, two-dimensional vortical structures in a high Reynolds number flow in the natural environment. It is believed that the lake bottom is not directly responsible for the observed structures. The mean temperatures at various depths were as follows: 20.7C at the surface, 19.2C at 1 m, 17.4C at 2 m, and 14.3C at 3 m. (Cassar-FRC)

TREATABILITY AND PATHWAYS OF PRIORITY POLLUTANTS IN THE BIOLOGICAL WASTEWATER TREATMENT,

Environmental Protection Agency, Washington, DC.
S. T. Hwang.
AIChE Symposium Series, Vol 77, No 209, p 316-326, 1981. 5 Fig, 26 Ref.

Descriptors: *Kinetics, *Biodegradation, *Air stripping, *Adsorption, *Wastewater treatment, Biological treatment, Sludge, *Fate of pollutants, Mass transfer, Diffusion coefficient, Priority pollutants, Organic compounds, Metals, Activated sludge process.

A review of state-of-the-art literature on biodegradation kinetics, air stripping, and adsorption on sludge of priority pollutants resulted in a unified framework by which to quantify removal of toxic chemicals by multimedia pathways in biological wastewater treatment systems. Biodegradation of toxic chemical substances is best described by Grau kinetics. An estimate of mass transfer coefficients in air stripping can be obtained from the ratio of the diffusion coefficient, molecular weights, or critical volumes in conjunction with a known value of the mass transfer coefficient. Sludge adsorbs some priority pollutants, primarily polynuclear aromatic compounds, metals, and cyanides. The disappearance of a specific toxic pollutant in sludge in nonbiodegradable form can be represented by the multicomponent adsorption equation of Langmuir type based on the binary characterization of wastewater adsorption. COMPARATIVE STUDY OF THE TROPHIC TRANSFER OF TWO MERCURY COMPOUNDS--HGCL2 AND CH3HGCL--BETWEEN CHLORELLA VULGARIS AND DAPHNIA MAGNA. INFLUENCE OF TEMPERATURE,

Bordeaux-1 Univ., Talence (France). Lab. d'Ecologie Animale.
A. Boudou, and F. Ribeyre.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 624-629, November, 1981. 1 Fig, 2 Tab, 11 Ref.

Descriptors: *Bioaccumulation, *Aquatic life, *Mercury, Algae, Daphnia, Chlorella, Invertebrates, Temperature effects, Water pollution effects, Methylmercury, *Fate of pollutants, Organomercury compounds.

The transfer of two mercury compounds, mercuric chloride and methyl mercury chloride, between a producer level species (Chlorella vulgaris) and a primary consumer (Daphnia magna) was compared at 10 and 18C. Metal concentrations were 1 ppb. Chlorella took up 86% and 96% of initial Hg from mercuric chloride at 10 and 18C, respectively, and 100% and 98% of initial Hg from methyl mercury at 10 and 18C, respectively. Daphnia exposed to the contaminated chlorella for 4 days accumulated 6% Hg at both 10 and 18C in the mercuric chloride flasks and 21% and 58% Hg at 10C and 18C, respectively, in the methyl mercury flasks. At the higher temperature Daphnia ingest more food. The identical Hg accumulation rates of Daphnia in mercuric chloride at both temperatures are explained by some direct contamination at 10C. (Cassar-FRC)

DEVELOPMENT DOCUMENT FOR PROPOSED EFFLUENT LIMITATIONS GUIDELINES, NEW SOURCE PERFORMANCE STANDARDS, AND PRETREATMENT STANDARDS FOR THE IRON AND STEEL MANUFACTURING POINT SOURCE CATEGORY, VOLUME I; GENERAL.

Environmental Protection Agency, DC. Effluent Guidelines Div.
Report EPA-400/1-80/024-b, December, 1980. 463 p, 8 Fig, 65 tab, 153 Ref, 3 Append.

Descriptors: *Steel industry, *Industrial wastes, *Water pollution sources, *Water pollution control, *Wastewater treatment, Effluents, Pollutants, Flow control, Toxicity, Organic compounds, Inorganic compounds, Water quality standards, Costs.

This volume discusses the general issues pertaining to development of BPT, BCT, and BAT effluent limitations, pretreatment standards for new and existing sources (PSNS and PSES) and new source performance standards (NSPS) for the steel industry. Regulations and proposed for twelve recognized subcategories of the industry. For the most part, the BPT effluent limitations promulgated in 1974 and 1976 are practicable and achievable by all steel facilities. The BAT limitations are more stringent, and are expected to reduce process flow by 90%, toxic organics by 92%, and other pollutants by 93% compared with the BPT limitations. In most cases the NSPS are equal to the proposed BAT effluent limitations. In most cases the proposed standards for toxic pollutants for PSES abd PSNS are the same as the limitations proposed for BAT. The costs for implementing the BPT and BAT limitations are estimated. (Brambley-FRC)
W82-03624

DEVELOPMENT DOCUMENT FOR PROPOSED EFFLUENT LIMITATIONS GUIDELINES, NEW SOURCE PERFORMANCE STANDARDS, AND PRETREATMENT STANDARDS FOR THE IRON AND STEEL MANUFACTURING POINT SOURCE CATEGORY, VOL II: COKE MAKING SUBCATEGORY, SINTERING SUBCATEGORY, IRON MAKING SUBCATEGORY,

Environmental Protection Agency, Washington, DC. Effluent Guidelines Div.
Report EPA-440/1-80/024b, December, 1980. 457 p, 66 Fig, 122 Tab.

Descriptors: *Steel industry, *Industrial wastes, *Water pollution sources, *Wastewater treatment, Effluents, Pollutants, Suspended solids, Flow control, Oil, Grease, Ammonia, Cyanides, Phenols, Organic compounds, Benzenes, Residual chlorine, Heavy metals, Costs, Water pollution control.

This volume contains the effluent limitations for BPT, BCT and BAT, as well as pretreatment standards for existing and new sources (PSES and PSNS) and new source performance standards (NSPS) for the cokemaking, sintering, and ironmaking subcategories of the steel industry. The cokemaking subcategory has proposed limitations and standards for flow, total suspended solids, oil and grease, ammonia-nitrogen, total cyanide, phenols, benzene, naphthalene, benzo(a)pyrne, and pH. Separate BAT limitations will be proposed for those existing sources which have full scale physical/chemical BAT treatment systems. For the sintering subcategory, limitations are proposed for flow, total suspended solids, oil and grease, ammonia-nitrogen, total cyanide, phenols, total residual chlorine, lead, zinc, and pH. By controlling cyanide and phenols control of other organics is expected, and by controlling lead and zinc control of toxic metals is expected. Similar control is expected by the limitations proposed for the ironmaking category for these pollutants. Limitations for the ironmaking category are proposed for flow, total suspended solids, total cyanide, ammonia-nitrogen, phenols, total residual chlorine, lead, zinc, and pH. Cost estimates for implementing each control strategy for each subcategory are presented. (Brambley-SRC)
W82-03625

DEVELOPMENT DOCUMENT FOR PROPOSED EFFLUENT LIMITATIONS GUIDELINES, NEW SOURCE PERFORMANCE STANDARDS, AND PRETREATMENT STANDARDS FOR THE IRON AND STEEL MANUFACTURING POINT SOURCE CATEGORY, VOL IV: HOT FORMING SUBCATEGORY.

Environmental Protection Agency, Washington, DC. Effluent Guidelines Div.
Report EPA-440/1-80/024-b, December, 1980. 383 p, 77 Fig, 137 Tab.

Descriptors: *Steel industry, *Industrial waste, *Wastewater treatment, *Water pollution sources, *Water pollution control, Zero discharge, Flow control, Metals, Toxicity, Water reuse, Oil, Grease, Pollutants, Effluents, Suspended solids.

This volume contains the proposed effluent limitations for BPT, BCT, and BAT, pretreatment standards, for new and existing sources (PSNS and PSES) and new source performance standards (NSPS) for the hot forming subcategory of the steel industry. The subcategory has four subdivisions - primary, section, flat, and pipe and tube. Limits are proposed for flow, totals suspended solids, oil and grease, and toxic metals, and cost estimates are given. Extensive recycle of hot forming wastewaters considered as components of the BAT, NSPS and pretreatment alternative treatment system is considered appropriate to minimize toxic pollutant discharge from hot forming operations. The proposed BCT limitations are based on recycle and filtration, which are fully compatible with the technology used to develop the proposed BAT limitations. Some hot forming operations are

achieving zero discharge, using BPT, BAT, and BCT treatment model components. The EPA is soliciting comments on whether zero discharge limitations and standards should be proposed at the BAT, BCT, and NSPS levels. (Brambley-SRC)
W82-03627

DEVELOPMENT DOCUMENT FOR PROPOSED EFFLUENTS LIMITATIONS GUIDELINES, NEW SOURCE PERFORMANCE STANDARDS, AND PRETREATMENT STANDARDS FOR THE IRON AND STEEL MANUFACTURING POINT SOURCE CATEGORY, VOL V: SCALE REMOVAL SUBCATEGORY, ACID PICKLING SUBCATEGORY.

Environmental Protection Agency, Washinton, DC. Effluent Guidelines Div.
Report EPA-440/1-80/024-b, December, 1980. 529 p, 121 Fig, 183 Tab.

Descriptors: *Steel industry, *Iron industry, *Industrial wastes, *Wastewater treatment, *Water pollution sources, *Water pollution control, Pollutants, Effluents, Toxicity, Metals, Organic compounds, Flow control, Inorganic acids, Costs, Iron, Fluorides, Suspended solids.

This volume contains the proposed effluent limitations guidelines and standards for the scale removal and acid pickling subcategories of the iron and steel industry. In the scale removalsubcategory the kolene and hydride scale removal subdivisions are retained. Proposed BTP and BAT limitations are given for flow, total suspended solids, toxic metals, toxic organics, and other pollutants for both subdivisions with estimates of their costs. The proposed new source performance standards (NSPS) and the NSPS model treatment system are similar to the proposed BAT limitations and the BAT model tretment system, respectively. Standards intended to minimize the impact of pollutants on publicly owned treatment works (POTW) are proposed for new and existing sources discharging wastewaters to such works. Adequate control of those toxic pollutants not specifically limited is to be attained by controlling the pollutants for which limitations are proposed. The acid pickling subcategory contains three subdivisions - sulfuric, hydrochloric, and combination. BPT and BAT limitations are proposed for flow, total suspended solids, oil and grease, toxic metals, toxic organics, dissolved iron, and fluoride, and the costs are estimated. These standards will also apply to NSPS operations, except sulfuric acid pickling which will have zero discharge. Pretreatment standards are proposed for new and existing sources to limit the amount of toxic and other pollutants dishcarge to POTW's. (Brambley-SRC)

BIODEGRADATION OF LINEAR ALCOHOL ETHOXYLATES IN NATURAL WATERS,

Procter and Gamble Co., Cincinnati, OH.
R. J. Larson, and L. M. Games.
Environmental Science and Technology, Vol 15, No 12, p 1488-1493, December, 1981. 5 Fig, 2 Tab, 21 Ref.

Descriptors: *Surfactants, *Biodegradation, *Kinetics, Fate of pollutants, Detergents, Organic compounds, Linear alcohol ethoxylates, Degradation, Mineralization, Temperature effects, Thermodynamics, Water pollution control.

Linear alcohol ethoxylates (LAE's), a class of nonionic surfactants, biodegraded rapidly in Ohio River water at concentrations of environmental concern, 1 to 100 micrograms per liter. Degradation was first order with respect to concentration. Two pure-chain-length materials (C12E9 and C16E3) were used in the study. They were uniformly labeled with C14 in the ethoxylate chain or at the alpha carbon in the alkyl chain. Neither the alkyl nor ethoxylate chain length significantly affected the rate or degree of degradation. A C17E22 material showed degradation kinetics similar to these of the shorter-chain-length LAE's. The Arrhenius equation described the temperature effects on the rate of ethoxylate degradation from 3 to 34 C. Calculated activation energy was 9.5 kcal per mol for the C16E3 material. The C12E9 ethoxylate chain showed a somewhat similar pattern with deviations at the high and low temperature extremes. (Cassar-FRC)

MIGRATION THROUGH SOIL OF ORGANIC SOLUTES IN AN OIL-SHALE PROCESS WATER,

Geological Survey, Denver, CO.
J. A. Leenheer, and H. A. Stuber.
Environmental Science and Technology, Vol 15, No 12, p 1467-1475, December, 1981. 12 Fig, 3 Tab, 8 Ref.

Descriptors: *Soil adsorption capacity, *Oil shale, *Solute transport, Fate of pollutants, Adsorption, Soil columns, Organic carbon, *Leachates, Organic matter, Ammonium salts, Amines.

Migration of organic solutes in an oil shale retort water was studied in fine loamy soil columns. Dissolved organic carbon fractionation and high performance liquid chromatography were used to analyze leachates. The order of affinity of the fractions in retort water for soil was as follows: hydrophilic neutrals = hydrophilic acids < hydrophobic acids < hydrophilic bases < hydrophobic bases < hydrophobic neutrals. Retort water leached significant amounts of organic acids from the soil columns, and the soil selectively adsorbed some types of organic solutes from the water. Ammonium ions in the retort water extracted organic acids from the soil. A distilled water rinse after retort water leaching produced flush peaks of organic solutes. This was a result of the relaxation of the common ion effect as ammonium concentration decreased during the rinse. Aromatic amines in the hydrophobic and hydrophilic base fractions had the same relative order of rates of migration through the soil column as on a reversed-phase octadecylsilica liquid chromatographic column. Soil is an effective adsorbent for spills of no greater than one void volume. Application of more than one pore volume would produce migration of organic solutes and extraction of soil organic matter. Rain failing on the site of a retort water spill would also enhance migration and extraction of dissolved organics. (Cassar-FRC)

'ACID RAIN', DISSOLVED ALUMINUM AND CHEMICAL WEATHERING AT THE HUBBARD BROOK EXPERIMENTAL FOREST, NEW HAMPSHIRE,

Dartmouth Coll., Hanover, NH. Dept. of Earth Sciences.
N. M. Johnson, C. T. Driscoll, J. S. Eaton, G. E. Likens, and W. H. McDowell.
Geochimica et Cosmochmica Acta, Vol 45, No 9, p 1421-1437, September, 1981. 10 Fig, 7 Tab, 43 Ref.

Descriptors: *Acid rain, *Weathering, *Soil chemistry, Fate of pollutants, *Aluminum, Forests, Stream order, Acid streams, Streams, Chemical reactions, Silicates, Neutralization, Water quality, Hubbard Brook, Falls Brook, *New Hampshire, Fluorides.

The effects of acid rain were studied in Hubbard Brook Experimental Forest, where water quality and hydrologic data has been regularly sampled since 1963. Water samples were also collected at 9 sites along Falls Brook (first through fifth order stream) from February 1975 to February 1978. The watershed contains bedrock of high grade metamorphic rocks and granites overlain with glacial till composed of granites and schists; no carbonates are present. In Falls Brook the upper reaches were more acid, richer in aluminum, ammonia, and nitrate, and diminished in alkali and alkaline earth cations, total fluoride, silica, and polyphenols, compared with the lower reaches. Sulfate and chloride were constant. A study of the aluminum chemistry of the stream showed that the upper reaches contained more inorganic monomeric aluminum and less organically complexed aluminum than the lower reaches. Evidence suggested that neutralization of acid rain occurs by a two-step chemical reaction. First, strong acids are rapidly but incompletely neutralized by dissolution of a reactive aluminum phase in the soil zone. Waters rich in Al with pH 4.7-5.2 are produced. Total acidity, including both hydrogen ion and Al acidity, is then slowly neutralized by basic cations released by decomposition of silicate minerals. Most of the neutralization is accomplished within first and second order basins. (Cassar-FRC)

CHARACTERIZATION OF A CONTAMINANT PLUME IN GROUND WATER, MEREDOSIA, ILLINOIS,

Illinois State Water Survey, Champaign.
T. G. Naymik, and M. J. Barcelona.
Ground Water, Vol 19, No 5, p 517-526, September/October, 1981. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Ammonia, *Solute transport, *Groundwater pollution, *Plumes, Nitrates, Fertilizers, Model studies, Path of pollutants, Fate of pollutants, Meredosia, Illinois, Nitrification, Oxidation.

A numerical solute transport model was used to characterize the dynamics of a dissolved inorganic fertilizer plume in a shallow sand and gravel aquifer. The source of the pollution was inorganic fertilizers in an uncovered bin located on a property adjacent to a liquid ammonia fertilizer distribution terminal. Within the plume, ammonia concentrations were 285-2100 mg per liter; nitrate concentrations were 570-1885 mg per liter. Sulfate, K, Cl, PO4, and Fe levels were above background, but Ca and Mg levels were well below background levels. The plume was in a steady-state condition, having begun 3 years prior to the survey. Simulations suggested that the pollutant would be naturally flushed within 420 days once the fertilizer pile was removed. Chemical equilibrium calculations show that Ca solubility is controlled by phosphate and carbonate equilibria. The most significant removal mechanism for ammonia from the groundwater is oxidation by acclimated nitrifying bacteria. (Cassar-FRC)

MOVEMENT OF CADMIUM AND WATER IN SPLIT-ROOT WHEAT PLANTS,

Oklahoma State Univ., Stillwater. Dept. of Agronomy.
M. B. Kirkham.
Soil Science, Vol 129, No 6, p 339-344, 1980. 2 Fig, 3 Tab, 16 Ref.

Descriptors: Capillarity, *Nutrients, Capillary capacity, *Capillary water, Soil water, *Wheat, *Cadmium, Ion transport, Roots, Path of pollutants.

The water status of wheat plants, cadmium content of plants, and soil water content were measured over a period of 50 days. Water was effectively transferred from the roots in the nutrient solution into roots in the unwatered soil, since the latter remained wet during the 50 days of the study. It is suggested that water was probably moved by capillary action from the solution side into the soil side. The part of the roots exposed to the air looked dry, which suggested that the water moved inside the roots, either along the cell wall surface or inside the cells. High concentrations of cadmium were found in the leaves of plants with roots split between uncontaminated soil and soil with cadmium. High concentrations of cadmium were found in the roots not exposed to cadmium. This suggests that cadmium was taken up by roots exposed to cadmium, transported to the shoots, and then transported down the plant to roots not so exposed. If all water had moved directly from one side of the root zone to the other through the crown and had bypassed the shoots, high cadmium concentrations would not have been noted in the shoots. These findings suggest that roots in a poor environment may be kept alive by roots of the same system growing near water in a water table or other body of water. Cultivars could be selected that might transfer more water and ions than other cultivars. (Baker-FRC) ✓

THE CASE FOR THE PROTECTION OF MANGROVE SWAMPS: GEOCHEMICAL CONSIDERATIONS,

Adelaide Univ. (Australia). Centre for Environmental Studies.
P. Harbison.
Search, Vol 12, No 8, p 273-276, 1981. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Mangrove swamps, *Metals, Adsorption, Acidity, Swamps, Temperature effects, Aquatic life, Estuarine environment, Industrial wastes, Thermal pollution, Heated water, *Sediments, Fish.

A study was made from a geochemical aspect of the correlation between the sedimentary characteristics of the mangrove habitat and the factors which are known to influence the accumulation of heavy metals at the sediment/water interface. In South Africa several major industrial developments have been sited in or near mangrove swamps. The present recognition of the need to conserve these tidal swamps is based on their unique ecology, their contribution to the maintenance of fish populations, and their function in stabilizing the coastline. The most significant inputs to Gulf St. Vincent and Spencer Gulf are probably heated water, treated effluents, lead and zinc smelting wastes, hot water and seepage from fly ash, and steelworks discharge. A significant feature of all these discharges, apart from the heated water, is the content of heavy metals. Mangrove seedlings become established in sheltered, shallow, low-energy environments where the finest sediment fraction accumulates. This fraction contains high proportions of caly minerals, which present a very large surface area for the adsorption of heavy metals. The degree of adsorption or release of metals from fine particulates is highly pH-dependent. Changes in the pH of the water covering the mud surface in the mangrove swamp are strongly influenced by the photosynthetic activity of algal films. The most notorious features of mangrove mud, the black color and strong sulfide smell, are probably most relevant to its potential as a sink for heavy metals. The concentrations of metals in sediment samples collected during this study suggest that the natural physical and chemical characteristics of mangrove swamps do favor the accumulation of heavy metals in sediment. Natural occurrences which may facilitate the release of metals from the mangrove mud could also have a synergistic effect on their toxicity to marine organisms. (Baker-FRC)

TRACE ELEMENTS IN THE HYDROLOGIC CYCLE OF A FOREST ECOSYTEM,

California Univ., Berkeley. Dept. of Plant and Soil Biology.
J. G. McColl.
Plant and Soil, Vol 62, No 3, p 337-349, 1981. 3 Fig, 4 Tab, 19 Ref.

Descriptors: *Forest soils, *Trace elements, *Fate of pollutants, *Soil water, Forest hydrology, Copper, Manganese, Iron, Zinc, Precipitation, Metals, Stemflow, Rainfall, Throughfall, Litter, Toxins, Heavy metals.

Levels of Cu, Fe, Mn, and Zn, sometimes considered toxins, in bulk atmospheric precipitation, throughfall, stemflow, and soil solutions at 10-, 15-, 25-, and 30-cm depths in a Eucalyptus globulus forest of California were measured after each main storm event during the 1974-75 wet season. Metal concentrations in litter and plant samples were also determined. The hydrologic cycles of Cu, Fe, and Zn were similar, but Mn behaved differently. Mn and Zn were found mostly on forest canopy due to dry deposition, while Cu and Fe input occurred mostly on forest canopy due to dry deposition, while Cu and Fe input occurred mostly in rain. Cu, Zn and Fe levels in the soil solution fluctuated with downward movement of wetting fronts and were negatively correlated with pH. Fe levels in soil solution were approximately 10 times greater than in stemflow and throughfall. For Cu and Zn, the corresponding relative differences were much less. Mn was taken up by plants to a greater extent than Cu, Zn, or Fe. Since precipitation contained low levels of Mn, the increases in Mn levels from precipitation to throughfall and stemflow were greater than those for Fe, Cu or Zn. Mn levels in soil solution were also negatively correlated with pH. Although Mn accumulates in soil during the dry summer, it is quickly flushed out by the early rains of the wet season. (Geiger-FRC)

SIMULATING COAL PILE RUNOFF AS A DESIGN TOOL,

P. B. Katz, and G. T. Brookman.
Power Engineering, Vol 85, No 11, p 95-96, November, 1981. 1 Fig.

Descriptors: *Water pollution sources, *Runoff, *Model studies, Mathematical models, Utilities, Coal, Simulation, Design criteria, Precipitation, Drainage, Computers, *Coal pile runoff, Water pollution control.

Overdesign of treatment systems and reduction of chemical costs are considered in the simulation of precipitation and coal pile drainage through the use of a newly developed model. Development of the coal pile runoff mathematical model began in 1977 upon completion of an EPA-funded runoff study at two power plants with coal storage. On completion of the modeling program, deficiencies were noted in simulating the following: storm erosion of material from the coal storage pile, stormwater percolation through the coal pile, and pyrite oxidation/acid production in the coal pile. Physical or chemical phenomena associated with coal piles were then studied to determine which were valuable in the characterization of coal pile drainage. These phenomena included precipitation, surface runoff/infiltration, pile percolation and moisture content, snowmelt, and groundwater infiltration. Chemical and physical reactions occurring in the coal pile and thus considered included pyrite oxidation/acid production, freeze-thaw factor, gully erosion and coal pile washoff. The purpose behind simulating coal pile drainage is to design systems to treat acid drainage before discharge. A model allows simulation of several average and worst-case rainfall conditions as well as a plan for coal piles not yet formed. The model is now undergoing calibration and will be ready for use by the utility industry during 1982. (Baker-FRC)
W82-03692

RETENTION AND FATE OF EXPERIMENTALLY ADDED MERCURY IN A MASSACHUSETTS SALT MARSH TREATED WITH SEWAGE SLUDGE,

Woods Hole Oceanographic Institution, MA.
R. J. Breteler, J. M. Teal, and I. Valiela.
Marine Environmental Research, Vol 5, No 3, p 211-225, 1981. 3 Fig, 4 Tab, 41 Ref.

Descriptors: *Salt marshes, *Mercury, Heavy metals, Marshes, Tidal marshes, Municipal wastes, Sludge, Land disposal, Chemical analysis, *Fate of pollutants, Massachusetts.

An adaptation and development of methods for the determination of total mercury in environmental samples is presented. The technique is accurate, reproducible and applicable for peaty sediments, plants and animal tissues. The experimental plots each contained three habitats, characterized by dominant vegetation types. Tall low marsh extended a few meters on each side of the tidal creeks, was flooded twice daily and was covered with a tall form of Spartina alterniflora. Short low marsh contained predominantly a dwarf growth form of Spartina alterniflora and was considered a transitional zone to high marsh, which was covered by tidal water only during spring tides and dominated by Spartina patens and Distichlis spicata. Various amounts of a heavy metal-containing dried sewage sludge were applied to these plots. The treatments resulted in elevation of mercury levels in the surface 5 cm of soil. Discrepancies in the bulk density of marsh sediments corresponded with interparticle spaces and detritus/mineral ratios in the peat matrix. Mass balance calculations showed that wetlands covered with tall Spartina alterniflora lost mercury considerably faster than higher marsh locations, which retained virtually all mercury added. The shortest half-life of mercury calculated was four years. Grain size analyses of peat and sewage sludge suggested that mercury in the higher intertidal range remained associated with sludge components. Biochemical and physical processes affecting the dissipation of mercury from creekside sediments are discussed. (Baker-FRC)
W82-03695

MERCURY IN COASTAL AND ESTUARINE SEDIMENTS OF THE NORTHEASTERN IRISH SEA,

Lancaster Univ., Bailrigg (England). Dept. of Environmental Sciences.
J. E. Rae, and S. R. Aston.
Marine Pollution Bulletin, Vol 12, No 11, p 367-371, November, 1981. 4 Fig, 2 Tab, 32 Ref.

Descriptors: *Mercury, *Sediments, Organic carbon, *Path of pollutants, *Irish Sea, Mersey Estuary, Wyre Estuary, United Kingdom, Metals, Heavy metals, Industrial wastes, Chemical wastes, Water pollution sources, *Estuaries.

Surface sediments from the Wyre and Mersey estuaries contained 0.1-29.0 and 0.1-8.8 micrograms mercury per g, respectively. Sediments on the nearby Irish Sea coast had lower Hg levels, 0.1-0.4 micrograms per g. Both estuaries receive effluents from chlor-alkali plants. Hg concentrations were highly correlated with percent total oreganic carbon and percent of the < 63 microns grain size fraction of sediments. (Cassar-FRC)

THE FATE OF POLLUTANTS IN THE VADOSE ZONE, MONITORING METHODS AND CASE STUDIES,

Arizona Water Resources Research Center, Tuscon.
L. G. Wilson.
In: Proceedings of the Thirteenth Biennial Conference on Ground Water, Irvine, September 14-15, 1981. California Water Resources Center, University of California, Davis, Report No 53, November, 1981. p 128-154. 3 Fig, 6 Tab, 39 Ref.

Descriptors: *Vadose water, *Monitoring, *Water analysis, *Soil water table, *Sampling, Water pollution prevention, Water pollution sources, Groundwater movement, Infiltration, Deep percolation, Seepage, Root zone, Saturation zone, Lysimeters, *Fate of pollutants.

The vadose zone is important as a conduit and reservoir of liquids and liquid-borne pollutants. Monitoring in this zone can provide an early warning of pollutant movement. This paper reviews the processes operating in the vadose zone which affect pollutant mobility, describes common techniques of water quality monitoring in the vadose zone, and presents three case studies of vadose zone monitoring. The main processes to attenuate pollutant movement include biological, physical and physiochemical reactions, such as precipitation, surface reactions, chemical degradation, pH effects, oxidation-reduction effects, volatilization, and specific adsorption. Specific adsorption ap-

pears to be the most important process in retarding pollutant movement, particularly metals. The physicochemical processes that mobilize pollutants are dissolution and leaching of salts, cation exchange, oxidation-reduction, and pH effects. Organic matter, such as chelated metals, also causes certain pollutants to move in the vadose zone. Methods for monitoring pollutant flow include direct methods, such as resistivity techniques. Three methods are available for sampling in deeper regions of the vadose zone: solids sampling, suction lysimeters, and perched groundwater sampling. One case study in Illinois used lysimeters to show how pollutants had been attenuated. Another study in Arizona showed that pollutants were on route to the water table, and a third study, also in Arizona, showed that the groundwater system had already been impacted. (Atkins-Omniplan)

DUTCH DUMPS,
C. Schuuring.
Nature, Vol 289, No 5796, p 340, January 29, 1981.

Descriptors: *Chemical wastes, *Waste dumps, *Toxicity, Public health, Groundwater pollution, Drinking water, Industrial wastes, Agricultural chemicals, *Netherlands.

In the Netherlands, 3000 dumps containing chemical wastes have been identified, 500 of which are a recognized threat to public health. The Volgermeerpolder, a marshy area 5 miles from the center of Amsterdam, was found to contain about 10,000 drums of chemical wastes from a 2,4,5-T factory. This pollution scandal, among others, prompted a national inventory of chemical waste sites. The latest problem was when small amounts of methyl bromide were found in the drinking water in the horticultural area between the Hague and Rotterdam. The chemical is used to disinfect the soil at an estimated rate of 2000 tons/year, and the poison apparently seeped through the PVC tubes used for private water distribution. Public water companies have now been made responsible for private water supplies. (Small-FRC)

5C. Effects Of Pollution

OBSERVATIONS ON INFECTIONS ASSOCIATED WITH SOUTH WALES NATURAL WATERS,
University Hospital of Wales, Cardiff. Regional Public Health Lab.
R. W. S. Harvey, and T. H. Price.
Journal of Applied Bacteriology, Vol 51, No 2, p 369-374, October, 1981. 18 Ref.

Descriptors: *Infection, *Surface water, *Human diseases, Pathology, Diseases, Typhoid fever, Wales.

Cases of human disease related to exposure to contaminated surface waters in South Wales were identified through a central reporting system. During the summers of 1927-30 several persons who bathed in Roath Park Lake in Cardiff developed a papular dermatitis caused by skin penetration by the larvae of Carcaria ocellata found in the lake water. Roath Park Lake was treated with copper sulfate to destroy the snails which were the intermediate host of the larvae, but complaints of swimmers itch soon recurred and the lake was eventually closed to swimmers. Infections due to Leptospira icterohaemorrhagiae were diagnosed in the period 1940-1980. Of the 66 persons infected, 27 worked in coal mining, 9 were agricultural workers or small holders, 11 had contact with natural water and 3 were sewer workers. Of those with a history of contact with untreated waters, 9 had been immersed in a stream, pond, river or moat and two were fishermen. Two of those who immersed died of leptospirosis. Typhoid fever was diagnosed in one boy who had drunk water from the Morfa Brook. A young girl also developed typhoid and admitted to playing beside a stream near her house and placing her hands in the running water. In 1946, 48 proven infections of paratyphoid B fever were diagnosed. The cause was traced to a creamery whose supply of water came from a river grossly contaminated with sewage from towns higher up the valley. An outbreak of anthrax in cattle grazing in a field where river dredging spoils had been placed was not satisfactorily explained. (Baker-FRC)

THE CHEMISTRY AND FISHERY STATUS OF ACID LAKES IN NORWAY AND THEIR RELATIONSHIP TO EUROPEAN SULPHUR EMISSIONS,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
D. J. A. Brown, and K. Sadler.
Journal of Applied Ecology, Vol 18, No 2, p 433-441, August, 1981. 7 Fig, 12 Ref.

Descriptors: *Lakes, *Fisheries, *Acidic water, Water pollution effects, Acid rain, Air pollution, Sulfates, Sulfur, *Norway, Hydrogen ion concentration, *Sulfur emissions.

The effect of reducing sulfur emissions on the fish populations in southern Norway lakes (below 63 degrees North latitude) is estimated by analyzing the data of Wright and Snekvik (1978). This includes full chemical analyses of the water and fishery status of 471 lakes above 200 m elevation. In this group of lakes 48% have no fish, 43% are sparsely populated, and 9% have good populations. Regression analysis indicated that the pH and excess (non-sea) sulfate concentration were correlated, with a slope of 0.225. Assuming that the excess sulfate is largely derived from the combustion of fossil fuels, a 50% reduction in European sulfur emissions would increase pH by 0.2 units. This would improve the fishery status in lakes with pH above 4.9 (9% of all lakes). No improvement would take place in the 67% of lakes in the pH range 4.3-4.9, where pH and fish status are independent. Lakes north of the severely-impacted region would not be expected to improve in fishery status following a reduction in sulfur emissions. (Cassar-FRC)

CARCINOGENESIS OF SYNTHETIC ORGANIC CHEMICALS IN DRINKING WATER,
National Cancer Inst., Bethesda, MD. Div. of Cancer Cause and Prevention.
H. F. Kraybill.
Journal of the American Water Works Association, Vol 73, No 7, p 370-372, July, 1981. 2 Tab, 9 Ref.

Descriptors: *Carcinogens, *Drinking water, *Bioassay, Research priorities, Chemical wastes, Municipal water, Public health, Environmental effects, Water pollution effects.

The quantification of risk assessment of synthetic organic chemicals in drinking water by five experimental approaches is discussed. Seven hundred and sixty five organic chemicals have been detected in drinking water; of these, 43 are recognized or suspected carcinogens, 56 are mutagenic, and 18 are carcinogenic promoters. The recommended quantification procedures are: carcinogenesis bioassay with the use of rodents on concentrated water samples before and after GAC treatment, synthetic drinking water samples, in vivo bioassays for carcinogenesis and mutagenesis of samples of drinking water concentrates, use of large populations of rodents as cont.ol groups in multiple locations that use municipal water supplies, and the use of fish as an animal model to assess carcinogenic activity of a wide spectrum of municipal drinking water samples before and after GAC treatment. Thus, emphasis should be given to experimental approaches which can support epidemiologic studies and provide better leads for population studies. (Small-FRC)

EFFECTS OF SOME REPRESENTATIVE PETROLEUM REFINERY EFFLUENT COMPOUNDS ON PHOTOSYNTHESIS AND GROWTH OF NATURAL MARINE PHYTOPLANKTON ASSEMBLAGES: PART I--CRESOLS,
Scripps Institution of Oceanography, La Jolla, CA.
W. H. Thomas, S. S. Rossi, and D. L. R. Seibert.
Marine Environmental Research, Vol 4, No 3, p 203-215, 1980-81. 6 Fig, 1 Tab, 21 Ref.

Descriptors: *Oil pollution, *Cresols, *Phytoplankton, Growth rates, Toxicity, *Water pollution effects, Organic compounds, Aromatic compounds, Diatoms, Dinoflagellates, Algae, Marine algae, Photosynthesis.

Cresols inhibited growth of natural marine phytoplankton from Scripps Pier, La Jolla, California, at levels of 100 micrograms per liter where dinoflagellates were predominant and greater than 10,000 micrograms per liter where diatoms prevailed. Half-maximal photosynthesis concentrations were 10,000 micrograms per liter and 20,000 micrograms per liter, respectively. However, the reverse was true when the algae were studied in cultures. In a longer term experiment with natural algae, there was a 2-day growth lag at 8,500 micrograms per liter, but the algae recovered and grew at rates similar to controls. Complete growth inhibition occurred at 88,000 micrograms per liter in this experiment, during which diatoms grew and dinoflagellates and microflagellates disappeared. Cresols decreased with time, being degraded by bacteria and absorbed by the algae. (Cassar-FRC)

CHLORINATION OF DRINKING WATER AND PREGNANCY OUTCOMES IN NEW YORK VILLAGES, 1968-1977,
Columbia Univ., New York.
L. L. Rausch.
PhD Thesis, 1980. 198 p, 16 Fig, 11 Tab, 205 Ref, 3 Map, 6 Exhib, Append. University Microfilm International, Ann Arbor, MI; O der No GAX81-05095.

Descriptors: *Water quality, *Water treatment, *Chlorination, *Public health, Groundwater, Surface water, *Drinking water, Infection, Statistics, Mortality, Comparison studies, Nonchlorinated water, New York, Pregnancies.

Pregnancy outcomes in 1968-1977 were compared in three sets of predominantly white New York villages--one set using nonchlorinated ground water, one set using chlorinated ground water and one set using chlorinated surface water--closely matched according to geographic location and population size. Rates for prematurely terminated late fetal deaths and neonatal deaths were significantly higher in the villages using nonchlorinated water, despite the absence of a significant association involving gestational age or birthweight given gestational age. The relationship, occurring primarily in the northern part of the state, persisted when several maternal and health care factors were controlled, and was similar for both sexes. A significant interaction involving season was found, with the advantage of chlorination being most pronounced in the late spring and early summer. These findings were interpreted to be consistent with an effect of an unidentified waterborne infectious agent, which was eliminated by chlorination. Rates of anencephaly were found to be significantly higher in villages using surface water, in which organic by-products of chlorination are formed, than in villages using ground water, in which the presence of such compounds is negligible. Unfortunately, sample sizes were too small to permit further analysis. (Sinha-OEIS)

NEUROCHEMICAL AND PHYSIOLOGICAL CHANGES IN A TELEOST FISH INDUCED BY

EXPOSURE TO THE WATER SOLUBLE FRACTION OF SOUTH LOUISIANA CRUDE OIL OR ITS TOXIC AROMATIC COMPONENTS,

Tulane Univ., New Orleans, LA. Dept. of Biology.
L. C. Russel.
PhD Thesis, 1980. 67 p, 4 Fig, 3 Tab, 69 Ref. University Microfilm International, Ann Arbor, MI; Order No GAX81-09922.

Descriptors: *Oil pollution, *Water pollution effects, *Fish, *Toxicity, South Louisiana crude oil, *Physiology, Aromatic components, Water soluble fraction(WSF), Teleost fish, Fundulus grandus.

The brains of the Gulf killifish, Fundulus grandis, accumulate naphthalenes when this fish is exposed to sublethal concentrations of the water soluble fraction (WSF) of South Louisiana Crude oil, naphthalene or 3,6-dimethylnaphthalene. After 24 hr, the naphthalenes become localized mainly in the prosencephalon and myelencephalon, the two more external brain regions. The opercular breathing rate is reduced by exposure to the WSF or pure naphthalenes, maximum change occurring 3-6 hr after exposure. The opercular breathing rate is increased by intraperitoneal injection of 1-DOPA and decreased by intraperitoneal injection of reserpine. The pigment in the melanophores of killifish becomes significantly more dispersed after exposure to sublethal concentrations of the WSF or pure naphthalenes. Intraperitoneal injection of 1-DOPA induces melanophore pigment aggregation. Melanophore dispersion is induced by intraperitoneal injection of reserpine. The mean DA concentration in the brains of killifish became reduced by a 24 hr exposure to the sublethal WSF or pure naphthalenes. The mean DA level in the brains of killifish increases after injection of 1-DOPA, and decreases following injection of reserpine. The volatine aromatic hydrocarbons of the WSF may, like reserpine, affect the brain DA level of fish by exerting a toxic action upon the DA-containing storage granules. The breathing rate and degree of melanophore dispersion are related to the level of DA in the brains of Gulf killifish. The preceding data and the discussion thereof are an attempt to provide greater perspective in the overall assessment of the hazards of petroleum pollution in the marine environment. (Sinha-OEIS)

PRODUCTION AND DECOMPOSITION OF ORGANIC MATTER AND BACTERIOPLANKTON UNDER EUTROPHICATION CONDITIONS,

Akademiya Nauk SSSR, Moscow. Inst. Biologii Vnutrennykh Vod.
A. K. Stolbunov.
Water Resources, Vol 8, No 1, p 71-84, January/February, 1981. 1 Fig, 8 Tab, 27 Ref. Translated from Vodnye Resursy, No 1, p 140-155, January/February, 1981.

Descriptors: *Organic matter, *Eutrophication, *Thermal pollution, Reservoirs, *USSR, *Ivankovo Reservoir, Bacteria, Primary productivity, Productivity, Macrophytes, Aquatic plants, Biological oxygen demand, Shallow water, Heated water, Powerplants, *Water pollution effects, Water quality, Nutrients, Nonpoint pollution sources.

The eutrophic state of Ivankovo Reservoir, one of the oldest on the Volga River, USSR, was investigated by determining BOD, primary production, decomposition of organic matter, bacterial production, total number of bacteria, and saprophytic bacteria at 15 sites representing shallow, deep, heated, and polluted water. On the whole the reservoir was classified as mesoeutrophic. Most of the eutrophic sections of the reservoir were in shallow bays and waters heated by thermal powerplant discharges. In the Shosha pool, average depth 1.7m, a vast macrophyte stand produces 35,000 tons of organic matter annually. Some areas of the reservoir are relatively non-eutrophic due to self-purification. Although input of nutrients from sewage is expected to decrease, nonpoint source pollution from agricultural land will become more significant. This will produce an increase in higher aquatic vegetation and organic matter, detrimental to water quality. (Cassar-FRC)

TEMPERATURE EFFECTS ON HYDRAZINE TOXICITY TO BLUEGILLS,

Air Force Aerospace Medical Research Lab., Wright-Patterson AFB, OH.
T. P. Hunt, J. W. Fisher, J. M. Livingston, and M. E. Putnam.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 588-595, November, 1981. 2 Fig, 4 Tab, 11 Ref.

Descriptors: *Toxicity, *Fish, *Hydrazine, *Bluegills, Water pollution effects, Temperature effects, Nitrogen compounds.

The acute toxicity of hydrazine to bluegill, Lepomis macrochirus, was determined at 10, 15.5 and 21C. LC50's (mg per liter) were as follows for exposures of 1, 6, 24, and 96 hours, respectively: 10C--265, 12.9, 7.7, and 1.6; 15.5C--68.4, 12.4, 3.8, and 1.0; 21C--37.7, 3.8, 1.7, and 1.2. The toxicity of hydrazine depended inversely upon the length of exposure according to a constant LC50 times exposure duration relationship. Toxicity increased with temperature, but water temperature played a more important role for the 1, 6, and 24 hour exposures than for the 96 hour exposures. (Cassar-FRC)

A SIMPLE, RAPID BIOASSAY FOR DETECTING EFFECTS OF POLLUTANTS ON BACTERIA,

Oregon State Univ., Corvallis. Dept. of Microbiology.
N. J. Bauer, R. J. Seidler, and M. D. Knittel.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 577-582, November, 1981. 2 Fig, 1 Tab, 9 Ref.

Descriptors: *Toxicity, *Bacteria, *Bioassay, *Water pollution effects, Microbiological studies, Dissolved oxygen, Oxygen depletion, Heavy metals, Metals, Pesticides, Herbicides, Pollutant identification, Cadmium, Copper, Nickel, Sulfates, Diuron, Pentachlorophenol, Atrazine, Trichloroacetic acid, Dimethylformamide, Diazinon.

A screening bioassay test was developed to predict toxicity of hazardous substances. The test measures the kinetics of dissolved oxygen depletion by a mixed microbial population following exposure to a pollutant. Results are available in 40 min. The pollutant is incubated in a bacteria-nutrient broth mixture, and dissolved oxygen depletion is monitored every 2 min. Results are expressed as the ratio of the test T50 (time of 50% dissolved oxygen depletion) to the control T50. This ratio is the activity quotient, which is 1.00 if the pollutant has no toxic effect, > 1.00 if stimulatory, and < 1.00 if toxic (0.8-0.94 designates slightly toxic; 0.5-0.79, moderately toxic; and < 0.5, extremely toxic). The activity coefficients of compounds during a brief exposure (about 30 min) and an extended exposure (22 hours) were as follows: Cd (5 ppm), 0.27 and 0.11; Cu (5 ppm), 0.43 and 0.24; Ni (5 ppm), 0.51 and 0.54; sulfate (50 ppm), 1.00 for both; diuron (40 ppm), 0.83 and 0.56; pentachlorophenol (14 ppm), 0.86 and 0.36; atrazine (33 ppm), 1.0 and 0.76; trichloroacetic acid (50 ppm), 0.96 and 0.88; dimethylformamide (50 ppm), 0.95 and 0.85; and diazinon (40 ppm), 1.01 and 1.03. The rapid, simple dissolved oxygen uptake assay system requires minor capital expenditures. (Cassar-FRC)

EVIDENCE FOR METAL POISONING IN ACUTE DEATHS OF LARGE RED DRUM (SCIAENOPS OCELLATA),

Florida Univ., Gainesville. Coll. of Veterinary Medicine.
P. T. Cardeilhac, C. F. Simpson, F. H. White, N. Thompson, and W. E. Carr.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 639-644, November, 1981. 2 Tab, 14 Ref.

Descriptors: *Toxicity, *Metals, *Fishkill, Water pollution effects, Heavy metals, Copper, Drum, Zinc, Arsenic, Chromium, Cadmium, Mercury, Gills, Mortality, Indian River Lagoon, *Florida, *Red drum.

Metal intoxication was the cause of a fishkill (about 100 large red drum) in the Indian River and Mosquito Lagoon, Florida, June 14-July 7, 1980. Pesticides, biological toxins, and hypoxia were eliminated as possible causes. Analysis of stomach contents showed that Cu, Zn, and As and possibly Cd, Hg, and Cr were responsible for poisoning the fish, which were feeding almost exclusively on large blue crabs at the time of the kill. Metal concentrations in tissues of moribund red drum showed the following increases (in ppm) over controls: Cu--liver 45, gill 8, kidney 10, and stomach contents 2; Zn--liver 132, gill 54, kidney 4, and stomach contents 25; As--liver 5.4; gill 0.5, kidney none, and stomach contents 0.3. Livers of the diseased fish showed increases over controls for Cr, Cd, and Hg of 59, 8.2, and 2.5 ppm, respectively. Gills on the affected fish were edematous and coated with mucus. This condition produced an electrolyte imbalance with dramatic increases of serum Na, Cl, and K. (Cassar-FRC)

HEMOSIDERIN GRANULES: CYTOTOXIC RESPONSE TO ARSENIC EXPOSURE IN CHANNEL CATFISH,

Texas Univ. at Austin. Dept. of Pharmacology.
E.M. B. Sorensen, and N. K. R. Smith.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 645-653, November, 1961. 7 Fig, 19 Ref.

Descriptors: *Arsenic, *Toxicity, *Fish, Water pollution effects, Metals, Channel catfish, Heavy metals, Liver, Hemosiderosis, *Catfish, Sublethal effects.

Adult channel catfish, Ictalurus punctatus, exposed to 15 ppm arsenic as sodium arsenate for 6 months, showed electron microscopic evidence of liver changes. Hepatocytes from affected catfish livers showed proliferated rough endoplasmic reticulum, smaller nuclei, and a great increase in size and number of hemosiderin granules. The probable cause of the hemosiderosis is hemolytic jaundice. Arsenic was found in the hemosiderin granules, suggesting storage of a toxic material in a less toxic, insoluble form. (Cassar-FRC)

RESPONSE OF TROUT HEPATIC MIXED-FUNCTION OXIDASES TO EXPERIMENTAL FEEDING OF TEN KNOWN OR POSSIBLE CHLORINATED ENVIRONMENTAL CONTAMINANTS,

Dalhousie Univ., Halifax (Nova Scotia). Coll. of Pharmacy.
F. C. P. Law, and R. F. Addison.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 605-609, November, 1981. 1 Tab, 15 Ref.

Descriptors: *Chlorinated hydrocarbons, *Toxicity, *Fish, Bioassay, Liver, *Trout, Enzymes, Sublethal effects, Polychlorinated biphenyls, Organic compounds, Aromatic compounds, Water pollution effects.

Brook trout, Salvelinus fontinalis, fed sublethal amounts of chlorinated organic compounds (to produce whole body concentrations of 200 micrograms per g) were studied for effects on mixed-function oxidases. The most useful indicators of MFO induction were benz(a)pyrene hydroxylase and ethoxycoumarin O-de-ethylase activities. Three potential polychlorinated biphenyl replacements (isopropyl chlorobiphenyls mixture, chlorinated naphthalenes mixture, and 1,2,4-trichlorobenzene) produced no apparent MFO induction in the fish. Varying responses were seen in the other materials tested: polychlorinated biphenyl, mirex,

hexachlorobenzene, hexachlorobutadiene, octachlorostyrene, and a brominated biphenyl based fire retardant. (Cassar-FRC)

KRAFT PULP MILL EFFLUENT AND SEDIMENT CAN RETARD DEVELOPMENT AND LYSE SEA URCHIN EGGS,

Shizuoka Coll. of Pharmaceutical Sciences (Japan). Lab. of Health Sciences.
N. Kinae, T. Hashizume, T. Makita, I. Tomita, and I. Kimura.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 616-623, November, 1981. 1 Fig, 5 Tab, 17 Ref.

Descriptors: *Sea urchins, *Pulp and paper industry, *Toxicity, Water pollution effects, *Industrial wastewater, Eggs, Kraft mills, Shinguu River, Japan, Invertebrates, Marine animals, Organic compounds, Effluents, Sediments, Carcinogens, Sea urchin eggs.

Sea urchin eggs, Anthocidaris crassispina, were exposed to ether extracts of kraft pulp mill effluent and sediments from the estuary of the Shinguu River, Japan. The extracts were separated into five fractions: neutral, acidic, basic, amphoteric, and phenolic. Of the effluent extracts the basic fraction was most toxic, decreasing the egg fertilization to 35% at 10 ppm concentration. Of the sediment extracts the acidic fraction was most toxic, decreasing fertilization of eggs to 25% at 10 ppm. All five fractions retarded development of eggs at 1 to 10 ppm and caused cytolysis at 100 ppm. Slime controller was the most toxic of nine pulp and paper industry materials similarly tested. (Cassar-FRC)

AN IN SITU STUDY OF CADMIUM AND MERCURY STRESS IN THE PLANKTON COMMUNITY OF LAKE 382, EXPERIMENTAL LAKES AREA, NORTHWESTERN ONTARIO,

Argonne National Lab., IL.
J. S. Marshall, J. I. Parker, D. L. Mellinger, and S. G. Lawrence.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 38, 2 Fig, 4 Tab, 28 Ref.

Descriptors: *Water pollution effects, *Cadmium, *Mercury, *Plankton, Heavy metals, Inorganic compounds, Zooplankton, Phytoplankton, *Lakes, Species diversity, Ecological effects, Species composition, Crustaceans, Aquatic populations, Aquatic productivity, Primary productivity, *Ontario.

In the Experimental Lakes Area (ELA) Lake 382 of Northwestern Ontario, in situ experiments were carried out in 28-liter carboys at various depths to assess the effects of inorganic Hg and Cd on planktonic communities. Over a three-week period, additions of 9 nanomoles Cd/liter or 10 nanomoles Hg/liter caused significant reductions of crustacean zooplankton density, zooplankton community similarity and diversity, and levels of dissolved oxygen. Primary productivity of phytoplankton was decreased by additions of 20 nanomoles Hg/liter, but not by 10 nanomoles Hg/liter. The toxicities of inorganic Hg and Cd to lake plankton were similar on a molar concentration basis. At molar concentrations above 2 nanomoles/liter, Hg and Cd may cause significant changes in lake plankton communities. Close agreement of results was found for Cd levels over 0.2 micrograms/liter in experiments on ELA lakes and on Lake Michigan. However, toxic levels of inorganic Hg have not yet been documented in lake waters. (Geiger-FRC)
W82-03612

DETOXICATION OF ZINC AND CADMIUM BY THE FRESHWATER PROTOZOAN TETRAHYMENA PYROFORMIS. I. THE EFFECT OF WATER HARDNESS,

Queen Elizabeth Coll., London (England).
G. Chapman, and S. Dunlop.
Environmental Research, Vol 26, No 1, p 81-86, 1981. 2 Fig, 21 Ref.

Descriptors: *Zinc, *Cadmium, *Toxicity, Heavy metals, Metals, Calcium, Magnesium, Protozoa, Water pollution effects, Absorption, Path of pollutants, Metabolism, Chemical interactions, Hardness.

Zinc and cadmium toxicity to the protozoan Tetrahymena pyriformis were reduced in the presence of Ca and Mg ions in concentrations characteristic of very hard water. The 8-hour LC50 values (in ppm) for Zn were: < 1 ppm with no Ca or Mg, 14 with 500 ppm Ca, 28 with 500 ppm Mg, and 24 with 500 ppm Ca + Mg. LC50 values for Cd were generally lower: < 1 ppm with no Ca or Mg, 16 with 500 ppm Ca, 9 with 500 ppm Mg, and 19 with 500 ppm Ca + Mg. Experiments with Zn65 indicated that the uptake of this element from sublethal concentrations, 0.1 ppm, by 1 million cells were reduced from 0.5 micrograms per liter to 0.1 micrograms per liter by adding 500 ppm Ca alone or 500 ppm Ca + Mg. Mg alone was about half as effective in reducing toxicity. The mechanism of protection against Zn and Cd is thought to be reduced uptake at the cell membrane in the presence of Ca and Mg. Descriptors: *Water pollution effects, *Magnesium, *Calcium, *Drinking water, *Human physiology, *Hardness, Phsiological ecology, Public health, Potable water, Human pathology, Human population, Minerals.

Studies were made on the cardiovascular systems of women aged 20-49 years living in three study areas and a control area supplied with drinking water of different degrees of hardness and varying amounts of calcium and magnesium. Abnormal ausculatory sounds were observed more frequently in women in two of the three study areas. Electrocardiographic studies revealed a significantly decreased QRS voltage in study areas A and C. Sinus arrhythmia and reduced S-T interval were found more frequently in study areas A and B. Women from the three study areas also displayed electrocardiographic signs indicative of changes in electrophysiologic processes in the myocardium. A high positive correlation was discovered between the level of magnesium in drinking water and the amplitude of wave I. A high negative correlation was found between the overall hardness of the water, the quantity of magnesium in it, and the frequenncy of maximum arterial blood pressure in the danger zone in women aged 20-29 years. 5D. Waste Treatment Processes

MANAGING VEGETATION IN WASTEWATER APPLICATION,

Michigan State Univ., East Lansing. Inst. of Water Research.
F. M. D'Itri.
BioCycle, Vol 22, No 6, p 30-35, November-December, 1981.

Descriptors: *Land disposal, *Wastewater treatment, *Wastewater renovation, Vegetation regrowth, Vegetation establishment, Vegetation, Corn, Forest management, *Spray irrigation.

The proper selection and management of vegetation for the efficient renovation of municipal wastewater by slow rate, overland flow, or spray irrigation systems is discussed. The selection of land treatment relative to other methods depends on the size of the community and the expertise of local system operators, as well as the cost, quantity and type of land available. Once land treatment has been determined to be feasible, guidelines for operating and managing the system can be produced. Protecting the groundwater is a primary consideration. Spray irrigation has been the most common land treatment method in the north central United States. The responses of crops to slow rate wastewater application have been quite similar on all types of soil. The limited amount of leachate which does occur may contain nitrate concentrations greater than 10 mg/liter as nitrogen due to the absence of plant growth. Row crops such as corn are attractive, since their potential of economic return is high. However, the limited root biomass early in the season and limited period of rapid nutrient uptake can present problems. The tradeoff between good renovation and a cash return can best be attained by mixing corn and forage crops. Land application has proven excellent for phosphorus and nitrogen removal. Harvesting schedules are important for forage crops. Maximum crop yields and nutrient removals result when forage grasses are harvested three or more times per year with the first harvest in late May or early June. Forestry studies indicate that coniferous and hardwood forest ecosystems can be effective living filters to improve the quality of wastewater by removing the nutrients. Forest productivity was also increased by this process. (Baker-FRC)
W82-03401

PHOSPHORUS REDUCTION STUDIES,

A. V. Gray.
Water Pollution Control, Vol 80, No 3, p 333-340, 1981. 5 Fig, 20 Ref.

Descriptors: *Phosphorus removal, *Wastewater treatment, Phosphorus, Filtration, Lime, Effluents, Industrial wastes, Domestic wastes, Municipal wastes.

Waterborne phosphorus enters sewage treatment plants from three main sources. The domestic contribution is split between the phosphorus originating from detergents and that from human excreta. The third source is industrial. Influent sewage contains a mixture of phosphorus compounds including dissolved orthophosphate, dissolved and particulate organic phosphates, inorganic condensed phosphates, and particulate inorganic phosphates, either precipitated or adsorbed onto other solids. Detergent formulations include polyphosphates as builders and water conditioners such as sodium tripolyphosphate, trisodium phosphate, tetrasodium pyrophosphate, sodium tetraphosphate, and sodium hexametaphosphate. The use of the split-effluent lime process to achieve phosphorous reduction was investigated by treatment of secondary effluent at biological filtration works. Laboratory studies were conducted to determine the dose rates, floc settlement characteristics, and the size of flocculation tank required so that a pilot-scale plant could be made. Results indicate that different lime doses were required, depending on the character of the sewage. Higher alkalinity sewage required higher lime doses to attain the same degree of phosphorus removal, as the process appeared to be pH dependent. Best removal was obtained after the precipitation of magnesium hydroxide at pH

greater than 11.3. By using filtration, lower lime doses could be used, and consequently a less alkaline effluent would result, requiring less neutralization prior to dischare. Much lower sludge volumes would also result. The split-effluent practice was then tried, which splits the sewage into two unequal parts, adding the total lime to the smaller volume and mixing, followed by reuniting the parts and mixing again. This resulted in considerable monetary savings during neutralization steps. (Baker-FRC)

PRIMARY SEDIMENTATION OF SEWAGE,

Lanchester Polytechnic, Coventry (England). Dept. of Civil Engineering.
J. A. Anderson.
Water Pollution Control, Vol 80, No 3, p 413-420, 1981. 8 Fig, 2 Tab, 12 Ref.

Descriptors: *Sedimentation, Flow rates, *Suspended solids, Overflow, Flow, *Wastewater treatment, Primary wastewater treatment, *Settling tanks.

A new method is proposed which assesses the efficiency of primary sedimentation tanks in terms of the removal of settleable solids. From the results of tests on experimental and pilot-scale tanks and from data obtained for full-scale works, the non-settleable solids appear to be constant for a given works, being independent of both influent suspended solids concentrations and retention period or overflow rate. Factors which affect sedimentation tank design and performance include hydraulic behavior, inlet design, shape and depth of tank, effluent weir design and associated floc paths, design and operation of sludge scraper, arrangements for sludge storage and removal, variations in the influent flow rate and suspended solids, and physical, chemical and biological characteristics of the influent. While the effect of increasing the hydraulic loading at a particular works is difficult to predict accurately, it is suggested that for typical retention periods of around 6 hr, the effect of doubling the flow rate will probably cause only a slight reduction in efficiency of removal of settleable solids. It is suggested that the design of future sedimentation tanks be based on existing tanks whose efficiency of removal of settleable solids is high, possibly with increased overflow rates. (Baker-FRC)

ELIMINATION OF TOXIC METALS FROM WASTEWATER BY AN INTEGRATED WASTEWATER TREATMENT/WATER RECLAMATION,

National Inst. for Water Research, Pretoria (South Africa).
R. Smith, and S. G. Wiechers.
Water S A, Vol 7, No 2, p 65-70, April, 1981. 1 Fig, 8 Tab, 15 Ref.

Descriptors: *Water reuse, *Metals, *Toxicity, Denitrification, Clarification, *Wastewater treatment, Filtration, Chlorination, Activated carbon, Drinking water, Municipal wastes.

A pilot-scale integrated wastewater treatment/water reclamation plant was investigated for the removal of eight toxic metals: arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver. The plant includes combinations of biological and chemical-physical processes, and is operated on screened raw sewage at a flow of 2.4 cu m/hr. Treatment stages include denitrification, chemical mixing and clarification, nitrification and secondary clarification, filtration, active carbon adsorption, and final chlorination. Solutions containing the metals were fed into the system, and with the exception of barium, concentrations of all metals were reduced to values below their respective atomic absorption detection limits at or before the secondary clarification stage. Cadmium, chromium, mercury, and arsenic were completely removed at the chemical mixing/clarification stages. The active carbon treatment stage was also effective in removing metals. A system such as this could be used to prepare high quality water directly from raw sewage. (Small-FRC)

INNOVATIONS IN WASTEWATER TREATMENT PROCESSES: DESIGN BACKGROUND DOCUMENTS DUE IN 1981,

K. A. Godfrey, Jr.
Civil Engineering (New York), Vol 50, No 9, p 67-69, September, 1980.

Descriptors: *Publications, *Design criteria, Environmental Protection Agency, American Society of Civil Engineers, Water Pollution Control Federation, *Wastewater treatment, Organizations, Professional societies, *Water treatment facilities.

The EPA, the American Society of Civil Engineers, and the Water Pollution Control Federation are publishing the 'Design Information Series' to encourage use of innovative ideas in wastewater treatment process design. Typical subjects among the first of about 25 40-60 page reports are dry weather peaking, suspended-growth biological treatment performance, fixed-film biological treatment performance, mechanical reliability, and sidestreams. In addition, the 3 groups plan design documents of their own. the WPCF has scheduled 10 manuals for fall 1980 (sludge thickening, energy conservation, pumping stations, pretreatment, sewer design, sampling, etc.). The ASCE has 4 manuals of practice in preparation on environmental assessment, sewer design, nonpoint sources of pollution, and water treatment plant design management. The EPA also has several more documents on innovative technologies. (Cassar-FRC)

REPUBLIC STEEL RECYCLING 80% OF STEEL-MILL WASTEWATER.

Civil Engineering (New York), Vol 50, No 6, p 102-104, June, 1980. 1 Fig.

Descriptors: *Steel industry, *Industrial wastewater, Water reuse, *Wastewater treatment, Water pollution control, Recycling.

A $19 million 14 mgd wastewater treatment plant at Republic Steel's Canton, Ohio, plant makes possible an 80% wastewater reuse. The technology for coagulation and clarification is not unique, but the idea of a single, central wastewater treatment plant and its underground distribution system is unusual. The plant is constructed on pile foundations on poor soil in a flood plain. To further reduce treatment requirements, scale on steel bars is removed by mechanical grinding rather than by pickling liquor. A small percentage of makeup water prevents damage to the pipes from the high-Ca-Mg groundwater. (Cassar-FRC)

TAMPA'S HOOKERS POINT AWT PLANT WORKING WELL.

Civil Engineering (New York), Vol 51, No 6, p 56-58, June, 1981.

Descriptors: *Advanced wastewater treatment, *Design considerations, *Tampa, Florida, Wastewater treatment, Suspended solids, Biological oxygen demand, Dissolved oxygen, Oxygen, Nitrogen, Dentrification.

The Hookers Point advanced wastewater treatment plant near Tampa, Florida is described. The plant incorporates a number of innovations to achieve a high level of removal of BOD, suspended solids, and nitrogen from the wastewater. It is also designed to remove phosphorus. The receiving waters (Hillsborough River and Bay) appear to be improving. The plant has a flexibility of process which permits operation with a capacity of 60 mgd as an advanced wastewater treatment facility, or with a capacity of 120 mgd as a secondary treatment facility. The operation depends on how many of the oxygen reactors are devoted to carbonaceous BOD removal, and how many to conversion of ammonia to nitrate. There was no need for new primary clarifiers to be constructed, as the existing clarifiers were used to handle part of the raw wastewater, the rest being channeled directly to the oxygen reactors. Provision was made for the use of brewery waste as a food for bacteria prior to nitrification at some time in the future, replacing methanol. Total reactor tankage for BPD removal, nitrification, and denitrification is less than 3.5 hrs retention time. The filtration and denitrification processes were combined into one step. A low capital cost phosphate removal system is another of the innovations, whereby phosphate is removed by adding a precipitating chemical to the reactor. The final innovation is the use of low-energy sludge drying beds, in which a polymer is added to the sludge just before it flows into the bed. (Baker-FRC)

OUTLOOK FOR WATER AND WASTEWATER SYSTEMS, PROCESSES, AND EQUIPMENT: COMMENTS FROM CH2M HILL, CORVALLIS, OR,

J. W. Filbert.
Water/Engineering and Management, Vol 128, No 3, p 62, March, 1981.

Descriptors: *Wastewater treatment, *Wastewater facilities, *Management planning, Equipment, Projections, Federal regulations.

A major problem in the area of water and wastewater treatment is the poor quality of much of the equipment being utilized, as a result of Environmental Protection Agency (EPA) 'or equal' requirements for procurement. Although the EPA's new equipment prequalification procedure may bring significant improvement to the quality of major process equipment and systems supplied, the quality of most minor equipment and systems incorporated into plants will not be affected. The increasing realization that much of the equipment delivered to new construction is of poor quality should lead to revision of the regulations to permit owners to use cost-competitive but owner-selected process equipment procurement procedures. Systems and equipment brought on the market in the future should feature quality as well as performance and should become more popular. The demand for sludge thickening, conditioning, and dewatering equipment should also increase. Continued expansion and quality improvement in the instrumentation and control systems field as related to wastewater treatment is also expected. (Carroll-FRC)

UTILIZATION OF THE ALGAE OOCYSTIS SP. FOR TERTIARY TREATMENT OF WASTEWATERS - II. EFFECT OF PRELIMINARY CONDITIONING OF THE CELLS IN A CYCLOSTAT ON THEIR NITROGEN UPTAKE RATE DURING PROLONGED INCUBATIONS (IN FRENCH),

Laval Univ., Quebec. Center for Nutrition Studies.
J. de la Noue, G. A. Picard, J. P. Piette, and C. Kirouac.
Water Research, Vol 14, No 8, p 1125-1130, August, 1980. 5 Tab, 16 Ref. (English Summary).

Descriptors: *Wastewater treatment, *Algae, *Nutrients, Nitrogen, Tertiary wastewater treatment, Oocystis, Aquaculture, Kinetics.

Ammonia uptake rates by Oocystis sp. were compared in the preconditioning phase (phase I) and in the incubation phase (phase II) of wastewater treatment. In the preconditioning phase, the cells are conditioned with wastewater which has previously been subjected to primary and secondary treatment with activated sludge and diluted to give a low nitrogen concentration (50 micromolar ammonium nitrogen). In the incubation phase, the cells are inoculated into a more or less dilute secondary effluent, rich in nitrogen and phoahporus nutrients. This comparison was made in order to determine whether rapid uptake of nitrogen nutrients by 'starved' cells occurs during the prolonged incubations required for complete removal of nutrient from wastewater. At equilibrium in Phase I the phytoplankton cells had a relatively constant ammonium nitrogen uptake rate per cell. This rate varied in the six water stocks with different inorganic nutrient concentrations, but it was always 2.4-6 times lower than the uptake rate by these cells in Phase II. At the end of Phase II (12 hr) the cell nitrogen content was up to 3.5 times higher than the initial content. The results show

the potential of algal tertiary treatment for the purification of wastewater as well as for production of a biomass. (Hertzoff-FRC)

DESIGNING AN ENERGY-EFFICIENT WASTEWATER TREATMENT PLANT,

Water and Sewage Works, Vol 127, No 2, p 40-44, February, 1980. 7 Fig, 16 Tab.

Descriptors: *Water treatment facilities, *Design criteria, *Pumps, Wastewater treatment, Waste heat, Efficiency, Energy loss, Energy transfer, Energy conservation, Costs.

Various heat pump options believed to represent energy-saving methods for wastewater treatment plants are considered. These options include pumping heat from final effluent to heat the building by installing an evaporator section in the chlorine contact chamber. Annual savings would be about $860 in natural gas purchases, and the operating cost would be $760 annually. The pumping of heat from final effluent to heat the aeration tanks is also considered, along with pumping heat from compressor room to heat the main building, digester gas heating of primary digester and main building, digester gas fueling of an internal combustion engine directly coupled to an air compressor in the diffused aeration plant, and digester-gas fueling of the engine-generator set in the mechanical aeration plant. A summary of the various energy conservation methods and their costs and benefits is presented. (Baker-FRC)

DESIGNING FOR COARSE SAND FILTRATION SYSTEMS,

J. G. Walters.
Water and Sewage Works, Vol 127, No 2, p 28, February, 1980. 2 Fig.

Descriptors: *Filtration, *Design criteria, *Wastewater treatment, *Sand filters, Filters, Backwash, Pilot plants.

Backwash considerations when designing coarse sand filtration systems are discussed. Solids must be removed from the top of the filter to the wash water waste gullet. The dirty water is removed by means of wash troughs or a backwash weir and surface sweep. Additional horizontal velocity is imparted to the surface of the filter so that the solids flushed from the media can be efficiently swept into the gullet without wash troughs. During the filtering cycle wastewater flows into the filter bay through the surface sweep distributor. During backwash, unfiltered wastewater continues through the distributor at a rate of 2-3 Gpm/sq ft and sweeps dirty water toward the wastewater gullet. Loss of media from the system can be controlled by keeping the flow of air and water at such a rate as to avoid surges. Use of pilot plant studies may be profitable, but these must be carefully designed to yield constructive and useful results. (Baker-FRC)

MICROORGANISM INVENTORY IN ACTIVATED SLUDGE CONTROL,

Montgomery County Sanitary Dept., Dayton, OH.
R. R. Himebaugh.
Water/Engineering and Management, Vol REF, No HB, p R26-R30, 1981. 4 Fig, 1 Tab, 5 Ref.

Descriptors: *Activated sludge process, *Monitoring, Wastewater treatment, Protozoa, Bacteria, Sludge, Monitoring, *Microorganisms, Flagellates, Rotifers, Montgomery County, *Ohio.

A quick, easy method of assessing the biological status of the activated sludge system in operation at a wastewater treatment plant needs to be designed and incorporated as a daily parameter in plant operation. At the Montgomery County Western Regional Wastewater Treatment Plant, several levels of data are collected that allow immediate assessment of the activated sludge bio-system. Since this plant operates both a carbonaceous and a nitrogenous activated sludge process, it is highly susceptible to toxic material, especially in the nitrification process. In this assessment system, protozoa types are classified into four groups, and rotifers are included as a fifth group. Included in each general group are more specific organism types. A percentage of microorganism group types is calculated from a sample count. When 100 or 50 organisms total are tallied the count ends, and each group's percentage of the total organisms is calculated. This inventory provides information concerning the decrease in biomass due to toxic materials and also the changes occurring in the maturity or evolution of the microorganism population. The five groups are so defined that group 1 organisms are very primitive protozoa which would indicate an immature sludge, while group 5 organisms are a more highly evolved, mature group. Information on the biomass changes can be followed on a time graph. After collecting a sufficient amount of data, a break point can be established which signals to the operators of the system that some imbalance or toxicity in the system has occurred. Using this protozoa count parameter one measures the living condition of the activated sludge, thus allowing predictable information for operating the wastewater treatment plant, which is not offered by most other physical and chemical parameters currently being monitored. (Baker-FRC)

CONTROL OF THE ACTIVATED SLUDGE PROCESS,

New Hampshire Dept. of Highways.
R. P. Carter.
Water/Engineering and Management (Reference Number) p R131-2, R135-6, 1981. 2 Fig, 7 Ref.

Descriptors: *Activated sludge, *Mathematical models, Wastewater, *Microorganisms, *Aeration, *Wastewater treatment, Solids, Solid wastes, Digested sludge, Biodegradation, Effluent standards, Activated sludge process.

With the 'Al West' method of cotrolling the activated sludge process, it is difficult to maintain a steady state condition. This is attributed to the nature of the clarifier sludge flow demand formula, which does not take wasting into account and therefore leads to cycles of overwasting of the sludge. A mathematical solution to this problem is presented. It is based on the use of a centrifuge test to measure volume rather than weight as a control parameter. Such a test should provide a more accurate estimate of the number of microorganisms in the activated sludge system. (Titus-FRC)

IMPROVING TREATMENT WORKS EFFICIENCY,

Civil Engineering (London), p 45, October, 1981. 1 Fig.

Descriptors: *Control systems, *Monitoring, *Computers, Automation, *Wastewater facilities, Electric power production, Methane, *United Kingdom, Wastewater treatment.

A computer-based monitoring and control system is described which will control general plant functions and the generation of electrical power from processed sewage gas. This distributed system uses a series of microprocessors to carry out data collection and control functions which are linked to a PDP-11/23 microcomputer. Software comprises a set of modular programs to carry out data collection and analysis routines as well as the appropriate display, alarm, and control functions. The generators at the station run on a dual-fuel mixture of collected sludge gases (methane) and 10% diesel fuel. The system is being installed at the Wessex Water Authority's Avonmouth recovery facility. (Small-FRC)

TRIHALOMETHANE FORMATION FROM HUMIC MATERIALS IN CHLORINATED RECLAIMED WASTEWATER,

California Univ., Berkeley.
M. G. Richard.
PhD Thesis, June, 1980. 416 p, 51 Fig, 73 Tab, 217 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-29557.

Descriptors: *Wastewater treatment, *Secondary wastewater treatment, *Reclaimed water, *Chlorination, Halogens, Bromides, *Organic compounds, Disinfection, Humic acids, Microorganisms, Potable water, Public health, *Trihalomethane(THM), San Francisco Bay area.

Trihalomethane (THM) and other unidentified volatile halogenated organic compounds were formed in relatively large concentrations under conditions of normal wastewater disinfection in nine secondary and post-secondary wastewater effluents examined. Chlorination of treated wastewater under drinking water conditions as would occur in wastewater reclamation, to yield a long-term free chlorine residual, resulted in substantial increases in THM formation over that observed in chlorinated drinking waters. The formation of volatile halogenated organic compounds in chlorinated treated wastewater also differed from chlorinated drinking water in the following important ways: Bromine-substituted THM compounds predominated in most chlorinated treated wastewaters examined, accounting for from 50 to 89% of total THM products, while chloroform predominated in most chlorinated drinking waters. Non-THM volatile halogenated organic compounds were formed in much higher concentrations in chlorinated treated wastewater compared with chlorinated drinking waters. It is concluded that the use of treated reclaimed wastewater as a source of potable water supply, either directly or indirectly due to water supply contamination, could increase human exposure to halogenated organic compounds, unless remedial action is taken. PROJECT REPORT, PLANNING AND DESIGN DEVELOPMENT KAW POINT WASTEWATER TREATMENT PLANT, KANSAS CITY, KANSAS,

S Kansas Univ., Lawrence. School of Engineering and Architecture.
J. C. Roth.
PhD Thesis, April, 1980. 332 p, 23 Fig, 9 Tab, 10 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-26740.

Descriptors: *Engineering, *Wastewater treatment facilities, *Design criteria, Municipal wastewater, Industrial wastes, Secondary wastewater treatment, *Kansas City, Kansas.

This report is a systematic documentation of the inception, design development, design, and finally, the partial construction of additions to Municipal Wastewater Treatment Plant No. 1 (Kaw Point) in Kansas City, Kansas. The report demonstrates the relationship between engineering practices and non-engineering influences on a large-scale, multi-disciplined treatment plant design project. The subject is the design of secondary treatment facilities for an existing 36 million gallons per day primary wastewater treatment plant. A brief description of the three-phase project is presented in a table. Background information is provided on the community and existing facilities to aid in understanding specific reported actions. HEALTH AND SAFETY OF WASTEWATER TREATMENT PLANT PERSONNEL,

Oklahoma Univ. Health Sciences Center, Oklahoma City.
T. J. Carpenter.
PhD, Thesis, 1980. 97 p, 11 Fig, 6 Tab, 65 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-17740.

Descriptors: *Wastewater treatment, *Wastewater facilities, *Safety, Hazards, Public health, Microorganisms, Environmental effects, *Gases, Vapors, Occupational health hazards.

This investigation was designed to identify and evaluate the occupational health hazards of the total plant environment of a municipally operated wastewater treatment facility. During the 24-month study, a 25-mgd trickling filter plant was subjected to a comprehensive industrial hygiene investigation followed by a detailed analysis of the health hazard considered to be the most significant. It was concluded that the facility studied and potentially all others having similar unit operations, contained many serious physical, chemical, and biological hazards to the health and safety of those employed in and around such facilities. The following summary of findings is offered: Violations of good safety practices were numerous and included improper location of chlorine gas masks, improperly mounted and outdated fire extinguishers, unprotected pit openings, insufficient ventilation, unsecured cylinders of compressed gas, exposed v-belts, inadequate showering and eating facilities, and poor general housekeeping. Exposure to physical hazards ranged from noise levels in the blower room and in the engine room to heat stress. Hazardous gases and vapors were frequently detected. Marked increases in airborne microorganisms were observed in both in-door and ambient environments. The alarmingly high counts observed in enclosed buildings where sewage was agitated was considered to be the most significant health hazard observed during the study. (Sinha-OEIS)

DESIGN MANUAL; ONSITE WASTEWATER TREATMENT AND DISPOSAL SYSTEMS,

Rural Systems Engineering, Madison, WI.
R. J. Otis, W. C. Boyle, E. V. Clements, and C. J. Schmidt.
Environmental Protection Agency Report EPA-625/1-80-012, October, 1980. 412 p, 86 Fig, 82 Tab, 204 Ref. 1 Append.

Descriptors: *Design criteria, *Wastewater treatment, *Wastewater disposal, *Domestic wastes, Septic tanks, Intermittent filters, Nutrient removal, Disinfection, Recycling, Water pollution prevention, Groundwater pollution.

Approximately 18 million housing units, or 25% of all housing units in the United States, dispose of their wastewater using onsite wastewater treatment and disposal systems. These systems include a variety of components and configurations, the most common being the septic tank/soil absorption system. The number of onsite systems is increasing, with about one-half million new systems being installed each year. This manual provides information on generic types of onsite wastewater treatment and disposal systems, and is intended for those involved in the design, construction, operation, maintenance, and regulation of onsite systems. Treatment methods considered include: septic tanks; intermittent sand filters; aerobic treatment units; disinfection; nutrient removal; waste segregation and recycle systems. Disposal methods include: subsurface soil absorption; evaporation systems; and outfall to surface waters. Groundwater and surface water pollution are major environmental considerations when onsite systems are used. All wastewater treatment and disposal systems must be designed, constructed, operated, and maintained to prevent degradation of both groundwater and surface water quality. Secondary criteria for selection of a design are cost and ease of operating and maintaining the system. The fate of any residuals resulting from the treatment and disposal system must be considered in the selection process. (Moore-SRC)

UNSLAKED LIME - ITS DIRECT USE IN PHOSPHORUS REMOVAL PROCESSES.

Environmental Protection Service, Burlington (Ontario). Wastewater Technology Center.
Canada-Ontario Agreement on Great Lakes Water Quality Research Report No 105, 1980, 24 p. 6 Fig, 14 Tab, 18 Ref.

Descriptors: *Phosphorus removal, *Wastewater treatment, *Lime, *Nitrification, *Hydration, Quicklime, Slaker, Experimental methods, Sewage, Sludge production, Slaking reactor, *Great Lakes, Water quality control, Canada.

This study, designed to evaluate the use of quicklime for phosphorus removal, was supported under the Canada-Ontario Agreement on Great Lakes Water Quality. The study was carried out in a 1.5 L/s (20 Igpm) pilot plant operated at the Wastewater Technology Centre. The experimental work occurred over a seven month period from October, 1972 to April, 1973. The study determined that quicklime may be used in place of hydrated lime without an increase in the lime requirement provided that the lime slaking temperature was within 60 to 82 degrees C and the water/quicklime ratio (weight basis) 6 to 10 at a slaking reactor detention time range of 5 to 50 minutes. A quicklime feed preparation system was developed and the full scale system design is presented. (WATDOC)

OZONE FOR MUNICIPAL WASTEWATER DISINFECTION,

Oklahoma State Univ., Stillwater. School of Civil Engineering.
E. L. Stover.
Water/Engineering and Management, Vol 128, No 10, p 74-76, 1981. 3 Fig, 2 Tab, 7 Ref.

Descriptors: *Wastewater treatment, *Disinfection, *Ozonation, Ozone, Costs, Water quality, Potable water, Municipal wastewater.

Applications of ozone for wastewater treatment are few at the present time in European countries. In the United States, disinfection of treated municipal wastewater is common practice and substantial research has gone into methods using ozone for this purpose. Absorbed ozone doses in the range of 4 to 8 mg/liter have been found to achieve disinfection levels of 200 fecal coliforms per 100 ml. At the operating plants tertiary and/or advanced wastewater treatment is accomplished prior to ozonation, resulting in clean effluents with suspended solids concentrations usually less than 10 mg/liter. Electrical power is the major source of operating expense for ozone production and application. About 10% of the total power required can be accounted for in the amount of gas produced, with the remainder consumed by air handling, air preparation, and waste heat production. Utilization of ozone must be accomplished as efficiently as possible since the production process is relatively expensive. The key element of an efficient process is the reactor or ozone contacting system. This must be designed for optimal ozone transfer or utilization by employing established principles of mass transfer and reaction kinetics. The amount of absorbed ozone required to achieve disinfection will vary from plant to plant depending on the characteristics of the influent. (Baker-FRC)

TREATING INFILTRATION AT ITS SOURCE REDUCES CAPITAL COSTS.

Water and Pollution Control, Vol 119, No 10, p 16, October, 1981.

Descriptors: *Sanitary engineering, *Storm seepage, *Sewer infiltration, *Overflow, *Capital costs, Wastewater treatment, Sanitation, Sewer systems, Storm runoff, Storm sewers, Future planning, Pipes, Decision making, Monitoring, Wastewater facilities.

To cope with problems caused by the infiltration of groundwater or stormwater runoff into sanitary sewers, Knox Martin Kretch Limited (KMKL) has devised a priority order for systematic investigations to help municipalities solve their sewer overflow difficulties. First, available flow analysis must be verified by field measurements and pump metering. When designing new sewage treatment facilities, negligence in treating the causes of unnecessary infiltration could result in increased capital costs of between $4320 and $7200/gallon/min of unnecessary flow. Gravity sewer systems should be divided into subcatchments for metering purposes. Areas of high infiltration should be monitored by closed circuit television to inspect pipe conditions and ensure the quality of joints. Dye and smoke testing of subcatchments can identify areas where catchbasins, roof leaders and perhaps storm sewers are cross connected to the sanitary system. Such flaws should be corrected to avoid damage to public areas and private residences as a result of sewer flow and gas backup. These investigations will point to areas where improvements may be made for future construction and where the emphasis of financing should be placed. (Geiger-FRC)

TEXANS CLAIM BREAKTHROUGH IN ANAEROBIC WASTE TREATMENT,

T. Davey.
Water and Pollution Control, Vol 119, No 10, p 10, October, 1981.

Descriptors: *Methane, *Anaerobic bacteria, *Activated sludge, Wastewater management, Sludge, Wastewater facilities, *Wastewater treatment, Effluent limitations, *Industrial wastes, Carbon dioxide, Anaerobic treatment, Bacteria, Oxidation process.

A new low energy anaerobic process for treating high strength industrial wastes has been developed. It is suitable for wastes from the petrochemical, pulp and paper, and food and beverage industries. The method offers a return on investment by reducing the amount of chemicals and electricity required in the treatment. It produces one tenth of the sludge produced by conventional methods and lessens the space requirements. Gas produced in the anaerobic reactor is compressed and burned. The effluent produced by the anaerobic reactor is separated, and aerobic bacteria are added and then returned to aeration basins. The aeration system is monitored by an automatic control system which maintains filter temperature at 99 degrees Farenheit and pH at 7. (Titus-FRC)
W82-03565

CLOSED CYCLE SYSTEM A BOON TO PULP AND PAPER INDUSTRY,

T. Davey.
Water and Pollution Control, Vol 119, No 10, p 18-19, October, 1981. 1 Tab.

Descriptors: *Water pollution control, *Pulp wastes, *Kraft mill wastes, *Pulp and paper industry, Industrial wastes, Bleaching wastes, Chlorine, Steam, Scaling, Corrosion, Biochemical oxygen demand, Capital costs, Estimated costs, Effluent limitations, Wastewater treatment, *Ontario.

A closed-cycle system for bleached kraft pulp mills has been developed and installed in Ontario, Canada. The design of this system includes: (1) reduced mill water usage, (2) countercurrent recycle of bleaching process streams, (3) 70 percent substitution of chlorine dioxide for chlorine in the first bleaching stage, (4) evaporation of the cooking liquor until the sodium chloride crystallizes and is removed by filtration, and (5) steam stripping of foul evaporator condensates. The mill has achieved its goal of reducing the need for mill effluent treatment. There is no apparent difference in the quality of the bleached pulp compared to the conventional process. Full closure of the water cycle has not yet been achieved because of corrosion in the recovery boiler superheater. Trials with full closure gave BOD5 discharges of 7.5 kg/tonne of pulp, compared to the normal kraft mill effluent of 40 kg/tonne and the value for partial closure of 15.4 kg/tonne. (Titus-FRC)
W82-03566

A COMPREHENSIVE STUDY ON THE BIOLOGICAL TREATABILITIES OF PHENOL AND METHANOL--I. ANALYSIS OF BACTERIAL GROWTH AND SUBSTRATE REMOVAL KINETICS BY A STATISTICAL METHOD,

Korea Inst. of Science and Technology, Seoul.
J. W. Kim, M. J. Humenick, and N. E. Armstrong.
Water Research, Vol 15, No 11, p 1221-1231, November, 1981. 3 Fig, 5 Tab, 8 Ref.

Descriptors: *Bacteria, *Kinetics, *Oxidation, *Wastewater treatment, Phenol, Methyl alcohol, Statistical methods, Biological treatment, Substrates, Decomposition, Degradation, Biodegradation, *Industrial wastewater, Chemical wastewater.

A statistical method is developed for the evaluation of kinetic coefficients in biological wastewater treatment. Equations describe the bacterial growth and substrate removal kinetics. The Michaelis-Menten constant (Ks) and cell yield coefficient are not significantly dependent on temperature, but substrate removal coefficient and cell decay coefficient are closely dependent on temperature. Ks and cell yield coefficient are 236 + or - 70 mg per liter and 1.21 + or - 0.06 respectively for phenol and 2330 + or - 1410 mg per liter and 1.25 + or - 0.45 respectively for methanol, based on total organic carbon and volatile suspended solids. A formula is given for oxygen utilization rate. In this expression the coefficient for oxygen requirement per substrate utilized is 1.39 for phenol and 2.23 for methanol; the coefficient for oxygen requirement per unit biomass for endogenous respiration is 1.42 times cell decay coefficient for both substances, based on total organic carbon and volatile suspended solids. (Cassar-FRC)
W82-03567

A COMPREHENSIVE STUDY ON THE BIOLOGICAL TREATABILITIES OF PHENOL AND METHANOL--III. TREATMENT SYSTEM DESIGN,

Korea Inst. of Science and Technology, Seoul.
J. W. Kim, and N. E. Armstrong.
Water Research, Vol 15, No 11, p 1249-1257, November, 1981. 12 Fig, 2 Ref.

Descriptors: Kinetics, *Biological treatment, Design criteria, *Phenol, Oxidation, *Methanol, *Wastewater treatment, Decomposition, Degradation, *Industrial wastewater, Chemical wastewater.

Systems for biological treatment of wastewater can be designed using mass balance equations for continuous stirred tank reactors (CSTR) and numerical methods and batch kinetic diagrams for batch systems. Batch systems require less aeration time to achieve a given effluent quality than CSTR systems. The relative efficiency of the CSTR systems to that of the batch systems, based on aeration time, rapidly decreases as the influent to effluent quality ratio increases. For example, a relative efficiency of 0.7 is obtained for 10 mg per liter influent, 0.27 for 50 mg per liter influent, and 0.05 for 500 mg per liter influent in the case of phenol, with a desired effluent level of 5 mg per liter total organic carbon and 3000 mg per liter initial volatile suspended solids. (Cassar-FRC)
W82-03568

COMPREHENSIVE STUDY ON THE BIOLOGICAL TREATABILITIES OF PHENOL AND METHANOL--II. THE EFFECTS OF TEMPERATURE, PH, SALINITY AND NUTRIENTS,

Korea Inst. of Science and Technology, Seoul.
J. W. Kim, and N. E. Armstrong.
Water Research, Vol 15, No 11, p 1233-1247, November, 1981. 20 Fig, 7 Tab, 9 Ref.

Descriptors: *Bacteria, *Oxidation, Kinetics, *Wastewater treatment, Methyl alcohol, *Phenol, *Methanol, Temperature effects, Hydrogen ion concentration, Salinity, Biological treatment, Statistical methods, Nutrients, Metals, Nitrogen, Phosphorus, Decomposition, Degradation, Biodegradation, *Industrial wastewater, Chemical wastewater.

A statistical method developed in a previous study was used to investigate the effects of temperature, pH, salinity, and nutrients on biological decomposition of wastewater. The optimum pH range for bacterial growth was near neutral. With phenol the optimum pH range in fresh water was 6.5-8.0. As salinity increased, the optimum pH range was 6-7 at 5C, 6.5-8 at 21C, and 7-8.5 at 28C. With methanol in fresh water, the optimum was 8-9 at 5C, and 9 at higher temperatures. Increasing salinity narrowed the tolerable pH range. The endogenous respiration rate was closely related to the substrate utilization rate coefficient and was affected by pH, temperature, and salinity. In batch biological treatments of 770 mg per liter phenol and 1000 mg per liter methanol, as total organic carbon, N and P had no recognizable effects on the substrate utilization rate coefficient, but Fe(2+), Mg(2+), Mn(2+), and Zn(2+) showed a slightly perceptible effect on it. In phenol treatments the absence of extracellular N and P produced a greater cell yield, but the cells decayed more rapidly than normal cells. In natural systems pH had significant effects on the substrate decomposition rate. Phenol decomposition decreased the pH considerably, so that in low alkalinity waters the bacterial action was delayed. The initial pH of the water was the most important factor in decomposition of methanol, which did not affect pH. An average initial lag in decomposition of 8 hours was seen in 8 of 115 phenol tests and 9 hours for 31 of 66 methanol tests. This produced average aeration lags of 5 hours for phenol and 6 hours for methanol. (Cassar-FRC)
W82-03569

COLIFORM AND CHEMICAL OXYGEN DEMAND REMOVAL FROM MEATWORKS EFFLUENTS BY DIFFERENT TREATMENT PROCESSES,

Commonwealth Scientific and Industrial Research Organization, Sydney (Australia). Animal Research Labs.
S. P. Moodie, B. V. Kavanagh, and M. G. Smith.
Water Research, Vol 15, No 11, p 1259-1263, November, 1981. 1 Fig, 3 Tab, 19 Ref.

Descriptors: *Meat processing industry, *Bacteria, *Chemical oxygen demand, *Wastewater treatment, Coliforms, Aerobic bacteria, *Activated sludge process, Alum, Coagulation, Physicochemical treatment, *Lagoons, Trickling filters.

Meat processing plant wastewaters with high bacterial levels (about 50 million per ml total aerobes and about 20 million per ml total coliforms) were subjected to treatment with 4 processes. The lagoon system and activated sludge system were most efficient, removing 89% and 96% COD, respectively, and 71% and 96% suspended solids, respectively. Bacteria were reduced by factors of 10 to 100 for anaerobes and 1000 to 10,000 for coliforms. The physicochemical treatment (alum coagulation) and high rate trickling filtration were less effective. COD removals were 61% and 39%, respectively, and suspended solids removals, 88% and 59%, respectively. Physicochemical treatment reduced bacterial counts by 10 times. Trickling filter treatment had little effect on bacterial counts. (Cassar-FRC)

EFFECT OF SLIME STUCK INSIDE SAMPLING PIPINGS ON WATER QUALITY AND HOW TO REMOVE IT,

Hitachi Ltd., Yokohama (Japan). Production Engineering Research Lab.
Y. Hiratsuka, K. Odajima, and H. Kihana.
Water Science and Technology, Vol 13, No 8, p 69-74, 1981. 6 Fig, 1 Tab, 4 Ref.

Descriptors: *Slime, *Process control, *Maintenance, *Cleaning, *Pipelines, Wastewater facilities, Water treatment, Water quality standards, Process water, Monitoring, Water analysis, Materials engineering.

Slime sometimes becomes stuck inside the sampling pipes of water quality measuring equipment in water purification and wastewater treatment plants, affecting the analysis of such water quality process parameters as turbidity, residual chlorine, dissolved oxygen, total organic carbon, and ammoniacal nitrogen. Conventional mechanical or chemical means of pipe cleaning are usually inadequate for slime removal. Washing with hypochlorite was time consuming and interrupted routine measurements. With a cannon-ball shaped elastic pig, washing through bends and small pipings was difficult. A system for cleaning with a small sponge ball driven through the piping by clean water under pressure was devised. The sponge ball can easily clean bends, elbows and branches set in a zig-zag pattern. The automatic sponge device was tested in a water purification plant. Results proved this pipe cleaning system satisfactory for keeping water clean for process monitoring purposes. (Geiger-FRC)

TERTIARY WASTEWATER TREATMENT TO REMOVE NITROGEN COMPOUNDS IN AERATED OXIDATION PONDS,

Academy of Municipal Economy, Moscow (USSR).
L. I. Gyunter, E. V. Grebenevich, V. A. Vavilin, and V. B. Vasil'ev.
Water Resources, Vol 8, No 1, p 61-71, January/February, 1981. 4 Fig, 8 Ref. Translated from Vodnye Resursy, No 1, p 128-139, January/February, 1981.

Descriptors: *Tertiary wastewater treatment, *Algal growth, *Oxidation ponds, *Wastewater treatment, Ponds, Nitrogen compounds, Aeration, Temperature effects, Nutrients, Model studies, Light quality, Carbon dioxide.

Tertiary treatment of wastewaters in algal ponds was studied in the laboratory and with a model to determine the effects of illumination, temperature, concentration of nitrogen compounds, and aeration. Illumination was the main factor limiting algal development in aerated ponds. Nonlimiting factors were dissolved in organic nitrogen (never less than 0.5 mg per liter) and CO2 shortage. Temperature produced retardation of growth only at 5-9C. The model indicated that the effectiveness of the treatment process depended on depth of pond, flow velocity, temperature, and illumination. Little oxidation would take place in fall and winter in the middle latitudes of the USSR. A three-section pond is 10% more effective than a one-section pond. Algae must be removed as formed to prevent secondary pollution from mineralization of dead algae. (Cassar-FRC)

ELECTROPLATING WASTES: HISTORY AND CURRENT STATUS,

C. F. Gurnham, and L. A. Ganzel.
Industrial Finishing, Vol 57, No 11, p 14-17, November, 1981.

Descriptors: *Electroplating, *Metal-finishing wastes, *Industrial wastewater, *Wastewater treatment, Chromium, Cyanide, History, Ion exchange, Evaporation, Membrane processes, Chemical precipitation, Reverse osmosis, Ultrafiltration.

The electroplating industry has been active in pollution control since the mid-1940's. By 1949 several treatment systems were in use--chlorination of cyanides, barium sulfide for chromium reduction and precipitation and sulfuric acid treatment followed by aeration to disperse HCN into the air. During the 1950's a metals reclamation plant was in operation. Historically, electroplaters have followed a three-phase treatment program: (1) destruction of cyanide by alkaline chlorination, (2) reduction of chromates to trivalent Cr, and (3) metal precipitation of the combined streams. There are several newer technologies. Ion exchange processes are useful in metal recovery and to prolong plating bath life. Evaporation techniques produce water suitable for reuse but are energy intensive. Improved metal precipitation methods use sulfides, hydrosulfides, or xanthates of starch or cellulose. Membrane processes are continuous and have low operating costs. These include ultrafiltration, good for alkaline cleaning solutions; reverse oxmosis, which produces water for reuse and a concentrated solution return to the plating bath; and electrodialysis, for saline waters. Donnan dialysis, an experimental countercurrent process, uses the concentration gradient across the membrane as the driving force. (Cassar-FRC)

WASTEWATER TREATMENT PLANT FEATURES NEW TECHNOLOGY,

Wade, Trim and Associates, Taylor, MI.
M. L. Alexander.

Public Works, Vol 112, No 11, p 50-52, November, 1981. 2 Fig.

Descriptors: *Wastewater treatment, *Sludge, Construction, *Activated sludge process, *Aeration, Wastewater facilities, Flow, Infiltration, Incineration, Energy, Dewatering, Sludge drying, Sludge thickening, Polymers, Filtered wastewater, Bay City, *Michigan.

Design of an advanced sludge handling sewage treatment plant for Bangor Township, Bay City, Michigan, is discussed. The plant uses three special features: (1) a jet aeration system in the activated sludge process, (2) a membrane type plate and frame filter press to produce sludge cakes which are 50% dewatered, and (3) an incinerator designed to burn the sludge in an autogenous mode using sludge as an energy source. The incinerator can be turned on and off to save energy. During the first year of operation, the facility has performed successfully. Influent biological oxygen demand and suspended solids average 136 mg/liter and 174 mg/liter respectively. (Titus-FRC)

HOW DO YOU BUILD WHEN SEWERS ARE INADEQUATE,

Browne (Richard) Associates, Wayne, NJ.
N. K. Stegmann.
Public Works, Vol 112, No 11, p 74-75, November, 1981.

Descriptors: *Construction, *Sewers, *Municipal wastes, Planning, *Sewer systems, Management planning, *Wastewater facilities, Wastewater disposal, Wastewater treatment, Interceptor sewers, Main sewers, Flow, Sewer infiltration, Case studies, Wayne Township, *New Jersey.

Municipal problems related to an imposed sewer ban are discussed. The tax structure can be adversely affected if property cannot be developed. A domino effect can occur when shutdown of commercial or industrial development results in loss of potential jobs. Wayne Township in New Jersey has an imposed sewer ban. Developers are allowed to hook up to the Township sewer system if they agree to rehabilitate a portion of the sewer system, reducing infiltration. This program allows development to proceed and reduces the flow to the treatment plant without imposing additional tax burdens on the residents at large or waiting for federal funds. (Titus-FRC)

INLAND CONTAINER SAVES MONEY WITH ANAEROBIC-AEROBIC TREATMENT PLANT,

Inland Container Corp., Newport Mill, IN.
C. J. Priest.
Tappi, Vol 64, No 11, p 56-50, 1981. 7 Tab.

Descriptors: *Pulp and paper industry, *Wastewater treatment, *Aerobic treatment, Costs, *Anaerobic digestion, Industrial wastes, Water conservation, Indianapolis, Indiana.

A new 350 tons/day waste paper recycling mill was begun in 1973 at Indianapolis, Indiana. The mill was designed for low water usage. It utilizes one million gallons per day, or about 2,000 gals per ton. It is obtained from on-site wells and steam condensate. All of the water is used several times before it becomes effluent. There are a number of pieces of equipment designed into the mill for cleaning and recycling process water. The original plant was built using pilot studies and projections from older mills. The initial effluent system consisted of a one million gal/day Dorr-Oliver clarifier, a one million gal emergency sludge pond, two 5.5 million gal aeration basins, and two 3.3 million gal polishing (settling) basins. The two aeration basins each had two 60 hp stationary aerators. A Parahall flume was used to measure daily discharge to the river. The effluent system was begun using the aeration basins in parallel without nutrient addition. After a few months operation was improved by running the aeration basins in series. Shortly after start-up the BOD load began to exceed 9,000 lb/day and has continued to increase to the present levels of 15,000 to 24,000 lb/day. One solution to the effluent problem was an activated sludge plant. Another was a direct anaerobic treatment. A pilot study of anaerobic treatment was performed, with the result that Inland was allowed to pursue conversion to an anaerobic/aerobic system. Five items of critical importance to control of the system include volatile acids, alkalinity, pH, temperature, and organic and hydraulic loading. (Baker-FRC)

BIOLOGICAL KINETIC DESIGN FOR NITRIFICATION IN HIGH-STRENGTH INDUSTRIAL WASTEWATERS,

Weston (Roy E.), Inc., West Chester, PA.
M. Ramanathan, and E. L. Stover.
AIChe Symposium Series, Vol 77, No 209, p 295-303, 1981. 3 Fig, 5 Tab.

Descriptors: *Nitrification, *Industrial wastewater, *Ammonia, Chemical wastewater, Activated sludge process, Oxidation, Design criteria, Sludge, *Wastewater treatment, Biological treatment, Organic compounds, Nitrogen compounds.

A high-strength wastewater was used to obtain design data in a two-stage continuous flow, biological activated sludge system. The influent contained 15,000-25,000 mg per liter COD, 1,000-2,000 mg per liter total Kjeldahl nitrogen (TKN), and 100-300 mg per liter ammonia-nitrogen. Typical treated effluent contained 2,000-4,000 mg per liter COD, 500-1,500 mg per liter TKN, and 500-1,000 mg per liter ammonia after the first (carbonaceous) digestion stage and 2,000-4,000 mg per liter COD, 100-300 mg per liter TKN, < 5 mg per liter ammonia-N, and 500-1000 mg per liter nitrate-N. Design parameters for a 1 mgd facility are given. Wastewater containing up to 1,500 mg per liter TKN and 100 mg per liter ammonia-N can be successfully treated. The reaction kinetics for nitrification can be related to a concentration loading ratio based on TKN, and the ratio, in turn, to the ammonia oxidation rate coefficient. The organic nitrogen compound oxidation appeared to be the controlling reaction rather than biological nitrification. (Cassar-FRC)

PRODUCTION OF AMMONIA IN A PACKED-BED ANAEROBIC UPFLOW (ANFLOW) BIOREACTOR,

Tennessee Univ., Knoxville. Dept. of Civil Engineering.
D. C. M. Hines, D. W. Weeter, and R. K. Genung.
AIChE Symposium Series, Vol 77, No 209, p 286-294, 1981. 10 Fig, 5 Tab, 17 Ref.

Descriptors: *Ammonia, *Anaerobic digestion, *Organic loading, *Hydraulic loading, *Wastewater treatment, Nitrification, Methane, Packed beds, Volatile acids.

Effluent ammonia concentrations from anaerobic, upflow (ANFLOW) biological wastewater treatment systems were studied under organic loading rates of 0.43 to 3.50 kg per cu m per day, hydraulic loading rates of 0.0068 and 0.0136 liters per sq m per sec, and soluble COD concentrations of 750, 1500, and 3000 mg per liter. COD removals (87.5-94%) were linearly correlated with organic loading rates at a given hydraulic loading rate. The profiles of soluble COD and volatile acids levels showed distinct regions of complex organic breakdown, ammonia formation, and wastes stabilization. The zones shifted with changes in operating conditions. Methane production, about 0.4 cu m per kg of soluble COD removed, was insensitive to organic loading rates and hydraulic loading rates. Effluent ammonia concentrations (65-217 mg per liter) were correlated with influent soluble COD concentrations and organic loading rates for a given hydraulic loading rate. Ammonia production rates (1.1-5.2 g per day) were related to organic loading rates and were independent of hydraulic loading rates over the range studied. Residual effluent ammonia was effectively removed by an aerobic unit sized at about 5% of the volume of the ANFLOW reactor. (Cassar-FRC)

DEVELOPMENT FOR PROPOSED EFFLUENT LIMITATIONS GUIDELINES, NEW SOURCE PERFORMANCE STANDARDS, AND PRETREATMENT STANDARDS FOR THE IRON AND STEEL MANUFACTURING POINT SOURCE CATEGORY VOL III: STEEL MAKING SUBCATEGORY, VACUUM DEGASSING SUBCATEGORY, CONTINUOUS CASTING SUBCATEGORY CONTINUOUS CASTING SUBCATEGORY,

Environmental Protection Agency, Washington, DC. Effluent Guidelines Div.
Environmental Protection Agency Report EPA-440/1-80/024-b, December, 1980. 513 p, 90 Fig, 183 Tab.

Descriptors: *Steel industry, *Industrial wastes, *Water pollution sources, *Wastewater treatment, Effluents, Pollutants, Flow control, Toxicity, Metals, Fluorides, Oil, Grease, *Water pollution control, Costs, Heavy metals, Suspended solids, Standards.

This volume contains effluent limitation giuidelines for BPT, BCT and BAT as well as pretreatment standards for new and existing sources (PSNS and PSES) and new source performance standards for the steelmaking, vacuum degassing, and continuous casting subcategories of the steel industry. For the steelmaking category BPT and BAT effluent discharge limitations are proposed for flow, total suspended solids, toxic metals, and fluoride, and the estimated costs are given. The proposed NSPS are equivalent to the BPT limitations for the semi-wet segments and to the BAT limitations for the set segments, with the exception of the open hearth furnace subdivision; no more are expected to be built. The PSNS abd PSES standards are generally equivalent to the proposed BAT limitations and NSPS. For the vacuum degassing subcategory, BPT and BAT limitations are proposed for flow, total suspended solids, and toxic metals, and cost estimates are given. The proposed NSPS are equivalent to the proposed BAT effluent limitations. The standards for PSNS and PSES are based upon the filtration of a treatment and recycle system effluent. For the continuous casting subcategory, BPT and BAT limitations are proposed for flow, total suspended solids, oil and grease, and toxic metals, and the estimated costs are given.

BAT, NSPS, PSES, and PSNS limitations and standards are being proposed for zinc, chromium, and lead. The proposed NSPS are equal to the proposed BCT limitations for conventional pollutants. The proposed PSNS and PSES limits are identical to the BAT limits for toxic metals. (Brambley-SRC)

Environmental Protection Agency, Washington, DC. Effluent Guidelines Div.
Environmental Protection Agency Report EPA-440/1-80/024-b, December, 1980. 606 p, 87 Fig, 177 Tab.

Descriptors: *Steel industry, *Wastewater treatment, *Industrial wastes, *Water pollution sources, Pollutants, Effluents, Flow control, Suspended solids, Oil, Grease, Heavy metals, Chlorinated hydrocarbons, Organic compounds, Costs, Water pollution control, Standards.

This volume contains the BPT, BCT and BAT effluent limitations, pretreatment standards for new and existing sources (PSNS and PSES), and new source performance standards (NSPS) for the cold rolling and cold worked pipe and tube subdivisions of the cold forming subcategory, and the alkaline cleaning and hot coating subcategories of the steel industry. In the cold rolling subdivision limits are proposed for flow, total suspended solids, oil and grease, total chromium, lead, total zinc, trichloroethane, nitrophenol, anthracene, tetrachloroethylene, and pH. The cold worked pipe and tube subdivision operations may use water or soluble oil solutions. For both operations zero discharges are proposed for all limitations and standards except PSES and PSNS for operations using water. BPT effluent loadings are proposed for flow, total suspended solids, oil and grease, dissolved iron, toxic metals and toxic organics in alkaline cleaning subcategory. In the hot coating subcategory effluent limitations are proposed for flow, total suspended solids, oil and grease, cadmium, total chromium lead, zinc and pH. For each category the estimated cost of implementing the control strategies are estimated. (Brambley-SRC)

PALM OIL WASTE TREATMENT STUDY IN MALAYSIA,

Asian Inst. of Tech., Bangkok (Thailand).
K. S. Hum, N. C. Thanh, and T. L. Lee.
Effluent and Water Treatment Journal, Vol 21, No 10, p 452-455, October, 1981. 1 Fig, 6 Tab, 4 Ref.

Descriptors: *Industrial wastes, *Wastewater treatment, Activated sludge, Digestion, Aerobic digestion, Anaerobic digestion, Anaerobic lagoons, Aerated lagoons, Lagoons, Food-processing wastes, *Palm oil wastewater, *Malaysia.

A palm oil wastewater treatment study was initiated in 1977 by the Asian Institute of Technology and the Division of Environment, Ministry of Science, Technology, and Environment, Malaysia. The combined wastewater from a palm oil mill is mainly composed of two kinds of wastes, the sterilizer condensate and the oil clarifier discharge. The waste is biologically degradable. Anaerobic ponds will generally be the simplest and cheapest anaerobic form of treatment for this wastewater. However, anaerobic ponds will not achieve an effluent quality suitable for discharge to a receiving water and a final aerobic stage of treatment be needed. At detention times between 15 and 20 days, 95% or more BOD5 and COD were removed by the anaerobic pond treatment. Various aerobic biological unit processes were then attempted for further treatment. Generally, aerobic processes were successful in removing 86-94% of BOD5 but only 60-68% of COD. Treatment methods employed included extended aeration with activated sludge process, aerated lagoons, biodrum, trickling filter, oxidation ditch and oxidation ponds. In cases where land prices are not high, anaerobic ponds followed by aerated lagoons would be an attractive combination for the treatment of palm oil wastewater in the tropical environment. However, high land costs could justify other treatment systems such as high rate digestion tank and/or activated sludge systems. (Baker-FRC)

WASTEWATER EFFECTS ON A WATERHYACINTH MARSH AND ADJACENT IMPOUNDMENT,

Universidad Nacional de Nicaragua, Managua.
A. Velga, and K. C. Ewel.
Environmental Management, Vol 5, No 6, p 537-541, November, 1981. 5 Fig, 2 Tab, 15 Ref.

Descriptors: *Wastewater disposal, *Water hyacinth, Water quality management, *Wastewater treatment, Phosphorus, Nutrients, Lakes, Ponds, Marshes, Florida, *Nutrient removal.

A study was conducted to determine the capability of a water hyacinth-dominated marsh to absorb nutrients from secondary sewage effluent, and thereby prevent eutrophication in an adjacent impoundment without additional management. Lake Alice, a shallow impoundment located on the campus of the University of Florida at Gainesville, was studied. The lake has received wastewater from the campus sewage treatment facilities since early 1960's. The lake has two components: a 21-ha shallow marsh to the east, dominated by waterhyacinths, and a deeper open water area to the west. The sewage treatment plant effluent and a stream that drains a small sinkhole are now the two major water inputs to the lake. The facility discharges about 7500 cubic meters/da. Retention time for the lake in the mid 1970's was about 4 days, but has doubled due to the diversion of effluent from a cooling system in 1976. Water flows from the marsh area into the area that is maintained free of waterhyacinths, and is discharged through wells at the far end of the impoundment. A water budget for the basin was estimated; phosphorus concentrations were monitored monthly at three stations in the marsh and at the discharge wells in the lake. Productivity levels were measured monthly where the marsh joined the lake and at the discharge wells. Only 16% of the phosphorus that enters the basin is stored. Gross primary productivity levels in the open water areas are very high, but high respiration rates appear to keep the lake in steady state. (Baker-FRC)

SOME METHODS AVAILABLE FOR TREATMENT OF WASTE WATER IN THE DAIRY INDUSTRY,

Imperial Coll. of Science and Technology, London (England). Public Health Engineering Lab.
M. A. Bull, R. M. Sterritt, and J. N. Lester.
Journal of Chemical Technology and Biotechnology, Vol 31, No 10, p 579-583, October, 1981. 33 Ref.

Descriptors: Wastewater, Effluent limitations, *Wastewater treatment, *Dairy industry, *Animal wastes, Recycling, Waste recovery, Filtration, Activated sludge, Ion exchange, Electrical equipment, Flocculation, Chemical coagulation, Farm wastes.

Methods of treating dairy waste water are reviewed. Typical ranges of effluent characteristics are presented, conventional methods of treatment are discussed and their disadvantages highlighted. Emphasis is placed on less common techniques of treatment including processed involving by-product recovery. Those processes concerned with protein recovery from whey have the greatest potential for future use within the industry and should be considered at the design stage of a new plant. Alternating double filtration is an effective treatment method which requires high land usage. Fixed film biological treatment methods are also possible, but their usefulness is limited by problems which frequently result in failure of the anaerobic processes. (Titus-FRC)

SLUDGE HANDLING AND DISPOSAL AT THE CENTRAL PROCESSING FACILITY, MONROE COUNTY, NEW YORK,

Monroe County Water Authority, Rochester, NY.
C. M. Frenz.
Journal of the New England Water Works Association, Vol 95, No 3, p 208-216, 1981.

Descriptors: *Sludge disposal, *Wastewater treatment, Water treatment facilities, Sludge drying, Dewatering, Sludge filters, Sludge thickening, *Monroe County, New York.

A joint venture study was conducted in 1971 to determine the most economically feasible plan to solve an existing pollution problem resulting from sludge contamination in Monroe County, New York, where sludge was entering the waters of Lake Ontario. At that time there were three water treatment plants. In this case the three water treatment plants were operated by distinct entities, one a municipality, one a private industry, and the third a public benefit corporation, the Authorit. The system as devised calls for equalized flow of wastewater of about one percent or less solids content being pumped to the processing facility, where each party's flow and solids are measured. Chemical inventory at each water treatment plant is a back-up to the solids meters. Wastewater enters two sludge thickener tanks. The thickened sludge is pumped to the reaction mixer and conditioned by the addition of lime, then further concentrated in the sludge decant tank, where the solids content reaches a maximum of about 9%. Supernatant from the thickener flows directly to the ship channel, where it is discharged without further treatment. Conditioned sludge from the decant tank is held in a retention tank, where polymer is added until sufficient inventory is available for a filter run. Filtrate removed is neutralized and discharged into the ship channel. The dewatered sludge cake drops into a storage bunker. While the facility is working well, further study is needed to test and improve operational procedures to produce the desired dewatered sludge at the optimum cost. (Baker-FRC)

PROCEDURES FOR ESTIMATING DRY WEATHER POLLUTANT DEPOSITION IN SEWER SYSTEMS,

Environmental Design and Planning, Inc., Boston, MA.
W. C. Pisano, C. Queiroz, G. L. Aronson, F. C. Blanc, and J. C. Shaughnessy.
Journal Water Pollution Control Federation, Vol 53, No 11, p 1627-1636, November, 1981. 3 Fig, 3 Tab, 7 Ref.

Descriptors: *Sewer systems, *Mathematical models, *Deposition, Sewers, Flushing, Solids, Sewage districts.

A predictive tool was developed, capable of defining on a preliminary basis the total amounts of solids and other pollutants that deposit in a sewer system. The model was a single-term power function relating total daily wastewater deposition over a collection system to simple sewer-shed characteristics such as service area, manhole-to-manhole length, etc. The physical characteristics of 75 collection subsystems from three major sewer systems in Massachusetts were analyzed. Data from field flushing experiments were used to estimate daily deposition loadings for some pollutants. The model was applied to a combined sewer collection system, and the estimated values given by three possible regression equations were reasonably close to the value derived from a detailed collection system model. ANAEROBIC ACTIVATED CARBON FILTER FOR THE TREATMENT OF PHENOL-BEARING WASTE WATER,

Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
K. A. Khan, M. T. Suidan, and W. H. Cross.
Journal Water Pollution Control Federation, Vol 53, No 10, p 1519-1532, October, 1981. 14 Fig, 4 Tab, 25 Ref.

Descriptors: *Phenols, *Glucose, *Carbon filters, *Methane, *Anaerobic digestion, Organic carbon, Total organic carbon, Organic wastes, Activated carbon, Biodegradation, Anaerobic conditions, *Wastewater treatment, Biological wastewater treatment, Chemical oxygen demand, Filters.

Two granular activated carbon-packed anaerobic bioreactors were constructed to test the treatment of phenolic waste water. One reactor system was fed a 2,000 milligram/liter glucose bearing substrate, while the other was fed a synthetic substrate bearing 200, 400, or 1,000 milligrams/liter of phenol. The first reactor was later fed an additional 200 or 400 milligrams/liter of phenol to assess the preacclimation and co-degradation patterns of glucose and phenol. The glucose-fed reactor effectively reduced the organic content of the feed substrate in 9.30 hours while producing an 87% methane-rich gas at 2,071 milliliters/day at STP. When the 200-milligram/liter phenol-bearing substrate was fed to another set of anaerobic activated carbon-packed filter columns, little methane was produced during the initial 135 days of continuous operation. After day 240, steady state operating conditions were achieved. At this steady-state, the first anaerobic column was responsible for reductions in COD, TOC, and phenol of 91, 86, and 99.85% respectively, overall. Methane gas production increased when the feed phenol content was increased to 400 and 1,000 milligrams/liter. When the 2,000-milligram/liter glucose-fed anaerobic system was fed an additional organic carbon source of phenol, methane production immediately increased. The biodegradation of glucose and phenol could occur simultaneously with no apparent antagonistic effects. (Geiger-FRC)

THE SUCCESSFUL TREATMENT OF TANKER BALLAST WATER AT A MEDITERRANEAN SITE,

H. W. Marson.
Progress in Water Technology, Vol 12, No 1, p 67-78, 1980. 3 Fig, 1 Tab, 6 Ref.

Descriptors: *Oily water, *Ballast, *Oil tankers, *Wastewater treatment, Oil pollution, Bilge, Ships, Water pollution prevention, *Mediterranean Sea.

A plant for the treatment of discharged tanker ballast water built at Sidi Kerir, Egypt, and its principles of operation are described. The 12,000 cu m/hr plant was started up in 1978 and has achieved an average oil content value of below 2 mg/liter. Oil is removed by surface skimming in storage tanks, followed by unassisted gravity separation in P-V tilted plate separators. The last traces of oil are removed by air bubble flotation and skimming in the holding basin. Plant effluent is finally released into the sea. An API sampler is located about 4 m from the final discharge weir. A reduction of the oil content of the polluted ballast water to below 10 mg/liter satisfies all official specifications and is the best that can be expected from gravity separation without the additional expense and control problems of aeration with or without flocculants and polyelectrolytes. The conditions at Sidi Kerir are particularly suitable for the methods used, which explains the facility's excellent results. (Small-FRC)

OIL-WATER SEPARATION BY INDUCED AIR FLOTATION,

Tulsa Univ., OK.
J. J. Byeseda.
PhD Thesis, 1980. 222 p, 25 Fig, 23 Tab, 37 Ref, 10 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-09640.

Descriptors: *Wastewater treatment, *Separation techniques, *Oily water, *Flotation, Bubbles, Oil wastes, Oil-water separation, Air flotation.

Brine solutions containing kerosine stabilized with oil-soluble petroleum sulfonates were treated by induced-air flotation in a continuous-flow pilot unit. The effects of inlet oil concentration, vessel residence time, air flowrate, bubble diameter, oil drop diameter, temperature, NaCl concentration, and cationic polyelectrolyte concentration were investigated. Oil drop and air bubble diameters, liquid residence time, and concentration of cationic polyelectrolyte were the most significant variables affecting overall flotation performance. Only drops larger than 2 micro m showed significant removal, while smaller drops were generated by the air-inducing rotor. The cationic polyelectrolyte improved flotation performance by increasing the number of large oil drops. The removal rate for each oil drop size was first order with respect to oil drop concentration and an experimental procedure permitting determination of the first-order rate constants for removal due only to bubble-drop interactions was developed. The oil drop and air bubble diameters were the only variables which affected these rate constants. Increasing oil drop diameter and decreasing bubble diameter increased the rate constants. Comparison of experimental and theoretically predicted rate constants showed that the mechanism of oil droplet removal by bubbles from 0.2 to 0.7 mm is one of hydrodynamic attachment in the wake behind the rising bubbles. RETROSPECTIVE ANALYSIS OF WATER SUPPLY AND WASTEWATER POLICIES IN PITTSBURGH, 1800-1959,

Carnegie-Mellon Univ., Pittsburgh, PA. Coll. of Humanities and Social Sciences.
T. F. Yosie.
PhD Thesis, May, 1981. 460 p, 9 Tab, 54 Ref, Numerous Footnotes. University Microfilms International, Ann Arbor, MI; Order No GAX81-18450.

Descriptors: *History, *Wastewater management, *Water quality management, *Water supply, Water policy, Public policy, Capital, Public health, Legal aspects, Social values, Sanitation, Technology, Sewerage, Pittsburgh, Pennsylvania.

This study is a retrospective technology assessment of wastewater and water quality decisions made by the city of Pittsburgh in the period from 1800 to 1959. The study focuses upon the areas of technology development and implementation, impacts in the health, environmental, governmental, economic, and values areas, and the development of policies to deal with both implementation and regulation of water quality impacts. The major conclusions to emerge from the study are as follows: (1) sewerage technology transferred the locus of pollution from the immediate locale to downstream or adjacent cities and illustrates the difficulty in changing a capital-intensive technology implemented for beneficial reasons when the negative impacts of the technology are felt by second parties; (2) the existence of an in-place capital-intensive technology and the policy of dealing with its negative impacts by retrofit discouraged attempts to deal with the original problem by other means; and (3) general societal values were integral to the acceptance of the technology as well as the values of specific groups who wished to promote social change through its implementation; in addition, the positive and negative impacts of the technology had unexpected effects upon the values of society. PREDICTING SUSPENDED SOLIDS REMOVAL IN PILOT SCALE SEDIMENT PONDS UTILIZING CHEMICAL FLOCCULATION,

Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
J. S. Tapp, Jr.
PhD Thesis, 1981. 506 p, 150 Fig, 28 Tab, 148 Ref, 6 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-18534.

Descriptors: *Suspended solids, *Flocculation, *Coagulation, *Runoff, Mining engineering, Model studies, Rainfall, Chemical coagulation, Forecasting, *Settleable solids, Sediment ponds.

The research described in this report was conducted to gain insight into the coagulation-flocculation process as it applies to runoff and eroded material from large precipitation events typical of those found in steep sloped watersheds. Laboratory and pilot scale tests were conducted to evaluate the effectiveness of induced coagulation/flocculation on total suspended solids removal in mine sediment ponds and to evaluate commonly used procedures for designing sediment ponds. The laboratory and pilot scale tests showed that chemical coagulation/flocculation produced suspended solids removal to a concentration of approximately one order of magnitude less than when no chemical was added. Based on the data collected during the laboratory and pilot scale phase of the research, various models for use in designing sediment ponds utilizing chemical flocculation agents were developed. Also, new routines were developed to make existing sediment pond models more descriptive of the settling and transport process occurring in a sediment pond. Although the soil and overburden used in the research were typical of that from surface mine sites, the models and procedures developed can also be used when treating sediment in runoff from other land uses such as urban, agriculture, silviculture and construction. CHARACTERISTICS OF AN AERATED LAGOON FOR MUNICIPAL WASTEWATER TREATMENT,

Kansas Univ., Lawrence. Dept. of Civil Engineering.
M. Norouzian.
PhD Thesis, April, 1980. 246 p, 25 Fig, 68 Tab, 114 Ref, 5 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-26725.

Descriptors: *Wastewater treatment, *Aerated lagoons, *Algal growth, Algae, Suspended solids, Municipal wastewater, Nitrification, Nutrients, Water quality standards, Pilot plants.

The objective of this research was to conduct a pilot plant study of a multicell aerated lagoon system treating domestic wastewaters with emphasis on changes in nutrients which affect algal growth in receiving waters. Two 3 cell aerated lagoons were constructed and operated for one year. The aerated lagoon had a 24 hour completely mixed cell followed by a 4 day partially mixed cell and a 9 day cell for solids separation. Data indicated that the 14 day aerated lagoon could produce a high quality effluent as far as BOD sub 5 and suspended solids reductions of the initial wastewaters were concerned. Approximately 40% of the nitrification reaction occurred in the 24 hour cell during summer operations with nitrification being completed in the second cell. When the ammonia nitrogen concentration was increased, nitrification destroyed the bicarbonate alkalinity and lowered the pH to 5.5. The effluent from the aerated lagoon under these conditions did not support algal growth over a period of one month. The wood media surfaces improved effluent quality by

Unfortunately, any scattered missing issues

retaining microbial solids. For the most part effluent quality from an aerated lagoon treating municipal wastewaters is dependent upon the growth of algae and the removal of suspended solids. The three cell aerated lagoon is a simple treatment system which can be easily designed, constructed and operated to provide good wastewaters treatment for small communities and for developing nations with limited resources. EPA'S I/A PROGRAM SPEEDS USE OF NEW WASTEWATER TREATMENT METHODS,

G. Dallaire.
Civil Engineering (New York), Vol 51, No 11, p 62-64, November, 1981.

Descriptors: *Grants, *Technology, *Wastewater treatment, Financing, Disinfection, Ultraviolet radiation, Aquaculture, Algae, Fish, Alternative technology, Innovative technology, Land treatment, Municipal wastewater, Research priorities, Fluidized beds, Ponds, Nutrient removal, Water hyacinth, Sludge digestion, Composting, Economic aspects, Costs.

The federal construction grants program was modified in 1977 to pay for 85% instead of 75% of design and construction costs if a community used an innovative/alternative technology for wastewater treatment. Alternative methods have been proven (land treatment, anaerobic digestion, earth mounds, sludge incineration, etc.) Innovative technologies have not yet been proven (ultraviolet disinfection, fluidized bed processes, deep shaft aeration, etc.). The goal of the projects now in progress is to produce savings in costs and energy, better quality effluents, and more environmentally suitable treatment systems. Several programs are cited as illustrations. Nassau County, New York, is planning a 10 mgd fluidized bed wastewater treatment facility to expand its activated sludge treatment plant. Water hyacinth ponds remove solids and nutrients in Austin, Texas (activated sludge digester supernatant) and in Shreveport, Louisiana (140,000 gpd raw sewage). Smithsburg, Maryland, has decided on ultraviolet disinfection of wastewater rather than a dechlorination plant as a means of protecting trout in the receiving stream. A three-lagoon aquaculture system is being tried in New Castle, Virginia, in place of an expensive high rate trickling filter system packed with plastic media. Worms are digesting raw sludge, undigested and underwatered, into a solid compost at Lufkin, Texas. Many of these communities would not have attempted innovative technologies without financial aid and the assurance that funds were available for corrective action in case the experimental projects failed. 5E. Ultimate Disposal Of Wastes

FOUR OPTIONS FOR HAZARDOUS WASTE DISPOSAL,

Municipal Environment Research Lab., Cincinnati, OH.
R. D. Hill, N. B. Shomaker, R. E. Landreth, and C. C. Wiles.
Civil Engineering, (New York), Vol 51, No 9, p 82-85, September, 1981. 2 Fig, 2 Tab.

Descriptors: *Hazardous materials, *Waste storage, Storage requirements, Disposal wells, Wells, Injection wells, Underground waste disposal, Storage, Landfills, Waste dumps, Land disposal, Groundwater pollution, *Waste disposal.

Four options for hazardous waste disposal are considered: landfills with the option of fixation before landfilling, land treatment, mine storage, and deep well injection. A hazardous waste landfill is a facility that has received a permit from the US EPA or a state agency to dispose hazardous waste by the landfill method. The landfills must be carefully engineered to provide long-term protection of groundwater, surface water, air and human health. All surface water discharges must be in compliance with the Nasional Pollutant Discharge Elimination System requirements. Rainfall patterns in the area need to be considered to determine runoff controls and diversions. Waste stabilization/solidification is a pretreatment process that has been proposed to insure safe disposal of wastes containing harmful constituents. Solidification improves the handling and physical characteristics of the waste. Use of land treatment can provide an efficient and cost effective treatment and disposal alternative when properly used. The technique is a dynamic process involving the interaction of waste, site, soil, climate, and biological activity, usually aerobic, to degrade, immobilize, or deactivate the waste constituents. Contaminants are reduced to acceptable limits, usually through biological degradation. Mine storage involves packing solidified wastes in drums, transporting them down mine shafts, and placing them in prepared rooms. The areas are segregated to contain wastes that are compatible with one another. The atmosphere is very dry, and the drums have an indefinite life unless corroded from the inside. Deep well disposal involves injection of liquid waste into subsurface geologic formations by means of wells.

HEAVY METALS IN SEWAGE SLUDGE--A MAJOR TOPIC OF JOINT EUROPEAN RESEARCH,

Bundesgesundheitsamt, Berlin (Germany, F.R.). Inst. fuer Wasser-.Boden-, und Lufthygiene.
R. Leschber.
Water Science and Technology, Vol 13, No 4/5, p 1087-1088, 1981.

Descriptors: *Heavy metals, *Research priorities, *Sludge utilization, International commissions, Europe, Sludge disposal, Environmental effects.

The problem of heavy metals in sewage sludge has been the subject of research conducted by the Second Research Program on Sewage Sludge, COST 68bis, of the CEC, since 1978. Working Party 2 has been active studying analytical methods for sludge digestion samples and the determination of heavy metals in digested samples. These results were reported at a Vienna symposium in October 1980. Working Party 5 is using the United Kingdom as a pilot country for studying the effects of heavy metals on soil and plants. ENERGY CRISIS REDIRECTS SLUDGE DISPOSAL PERSPECTIVES: PART II,

N. W. Schmidtke.
Water and Pollution Control, Vol 118, No 5, p 26, 28-29, May, 1980.

Descriptors: *Sludge disposal, *Sludge utilization, Digested sludge, *Land disposal, Municipal wastewater, Metals, Land reclamation, Agriculture, Composting.

The perception of sewage sludge as a disposal problem must change to recognition of sludge as a resource if cost effective and environmentally acceptable sludge management strategies are to be developed. Sludge disposal options currently available include sanitary landfills, incineration, ocean disposal, and underground disposal. Each of these options poses particular problems, and only incineration offers the possibility of resource recovery through the incorporation of heat recovery or power generation facilities. Several sludge utilization options are currently being investigated, including direct constituent recovery, land reclamation, application to agricultural land, and sludge composting. Many municipal sludges contain high concentrations of metals, phosphorus, precipitants such as iron and lime, and even precious metals, including gold and silver. Metal recovery is contemplated in some areas. Sludge has been successfully used for land reclamation purposes in several areas. Digested sludge has been used to generate topsoil for parks and golf courses, to stabilize and reclaim acid mine tailing areas and dredged river sand deposits, and to restore land to agricultural productivity. Sludge has been applied to agricultural lands for centuries to restore nutrients and organic materials. Sludge composting and the sale of sludge as a soil amendment are also being practiced in some areas. (Carroll-FRC)

THE ADSORPTION CHARACTERISTICS OF SOILS AND REMOVAL OF CADMIUM AND NICKEL FROM WASTEWATERS,

College of Petroleum and Minerals, Dhahran (Saudi Arabia).
M. Sadiq, and T. H. Zaidi.
Water, Air, and Soil Pollution, Vol 16, No 3, p 293-299, October, 1981. 2 Fig, 4 Tab, 13 Ref.

Descriptors: *Heavy metals, *Adsorption, *Wastewater disposal, Sludge disposal, *Land application, Fate of pollutants, Cadmium, Nickel, Metals, Precipitation, Soil properties, Cation exchange.

Adsorption of cadmium and nickel from municipal wastewaters spiked to 100 ppm of each metal was tested by shaking soil-wastewater mixtures for 50 days. Precipitation, not adsorption, appeared to be the major mechanism of removal in all 27 experimental soils. In the Cd experiments the following soil characteristics were correlated with Cd sorption: after 1 day of shaking-surface area, total Fe, total Al, total Ca, free CaCO3, saturated paste pH, and suspension pH. After 50 days only saturated paste pH and suspension pH were significantly correlated with Cd removal from wastewater. Clay content, organic matter, and cation exchange capacity were not correlated with Cd removal at any time during the experiment. In the Ni experiment the surface area, clay content, total Fe, total Al, total Ca, saturated paste pH, and suspension pH were correlated with Ni removal from wastewater after 1 day of shaking. At 50 days, surface area, total Fe and Al, and both pH parameters were still significant. Organic matter, cation exchange capacity, and free CaCO3 were not significant in Ni adsorption at any time. Present guidelines for applying sewage sludge to soil rely on cation exchange capacity of the particular soil. This study suggests that precipitation, not adsorption or cation exchange capacity, should be the basis of any predictive model for estimating Cd and Ni removal in soils. (Cassar-FRC)

A CLOSER LOOK AT DEEP WELL DISPOSAL OF WASTES,

Louisiana State Univ., Baton Rouge. Dept. of Civil Engineering.
R. G. Kazmann.
Ground Water, Vol 19, No 3, p 258-261, May/June, 1981.

Descriptors: *Waste disposal, *Aquifers, *Deep wells, *Saline water, *Geologic formations, Wells, Faults, Injection wells, Clays, Permeability, Oil wells.

The potential movement of wastes from deep injection wells to potable aquifers is examined in the Gulf Coast area. It was found that brine pressure in the deep well is approximately equal to sub-sea pressures, and that target aquifers are sandwiched between clay layers. The faults found in the Gulf Coast area serve primarily as obstacles to the flow of fluids. Abandoned test holes will not serve as conduits for the movement of wastes into overly-

ing formations of extremely low permeability. Deep well injection is considered the preferred method of toxic waste disposal under the conditions which exist in the Gulf Coast area, because it is unlikely that contamination would occur in the present era of geologic history. (Titus-FRC)

REGULATION OF UTILITY WASTE DISPOSAL PRACTICES,

K. D. Yard.
Power Engineering, Vol 85, No 11, p 83-85, November, 1981. 2 Fig, 2 Tab.

Descriptors: *Regulations, *Utilities, *Waste disposal, Industrial wastes, Hazardous materials, Groundwater, Water pollution sources, Water pollution control, Solid waste disposal, Wastewater disposal, Land disposal.

This article attempts to clarify the current regulatory picture as it relates to the utility industry and provide insight into possible future regulations. The legislative stimulus for new solid waste regulatory programs originated with the Resource Conservation and Recovery Act (RCRA) of 1976, which completely replaced the provisions of the Solid Waste Disposal Act of 1965 and expanded the role of the Environmental Protection Agency in solid waste management. The Act was designed to promote resource conservation and safe disposal of waste materials, and to direct the EPA to promulgate regulations to protect human health and the environment from the improper disposal and management of hazardous wastes. EPA regulations require the identification of waste materials as hazardous if they are included in a comprehensive list of waste sources and waste streams, or if they exhibit hazardous characteristics, such as toxicity, corrosivity, reactivity and ignitability. The criterion requiring groundwater protection has the greatest potential impact on utility waste disposal practices. It stipulated that a solid waste disposal facility must not contaminate an underground drinking water source beyond the solid waste boundary or an alternative boundary established by the state. The surface water management criterion refers to the Clean Water Act for control of point source discharges. Achieving regulatory compliance at already existing sites may not be straightforward. Strict compliance at some sites may not be possible. Coal burning wastes for the present are classified as non-hazardous while a study is being conducted. (Baker-FRC)

5F. Water Treatment and Quality Alteration

TRIHALOMETHANES IN DRINKING WATER,

Montgomery (James M.), Inc., Pasadena, CA.
M. D. Umphres, A. R. Trussell, C. H. Tate, and H. R. Trussell.
Water/Engineering and Management, Vol REF, No HB p R65-R66, R68-R70, R72-R74, R76, 1981. 8 Fig, 4 Tab, 43 Ref.

Descriptors: *Water quality, *Disinfection, *Trihalomethanes, Humus, Chlorination, Chlorine, Wastewater treatment, Activated carbon, Adsorption, Adsorbents, Ozonation, Potable water, Water treatment facilities, Methane, Organic compounds.

The presence of trihalomethanes (THM) in drinking water has caused concern over the past several years. In 1974 significant levels of THM were identified at the Rotterdam water utility in water which had just been chlorinated as part of the disinfection process. THMs are the products of the reaction of chlorine with humus. Due to the complexity of the organic precursors and the variety of possible reaction pathways, the chemistry of the THM reaction is not completely understood. Several analytical methods are available for measuring THMs in the low microgram/liter range. Many treatment alternatives have been considered for controlling THMs. Those with the greatest application involve minor adjustments in operation of existing unit processes such as reducing the chlorine dosage or changing the point of chlorination. These modifications include removing the THM precursor prior to chlorination, using an alternative disinfectant which does not form THMs, or removing the THMs after they are formed. Removal of the precursor can be achieved with granular activated carbon or ozonation. Alternative disinfectants include chlorine dioxide, ozone, chloramines, or combinations of disinfectants. Removal of THM can occur through adsorption techniques, packed-tower aeration, or the use of activated carbon. Treatment costs must be considered in any investigation of alternative methods and process changes. However, it is essential that all aspects of water quality and treatability be carefully examined and evaluated before a cost comparison is undertaken for a given treatment facility. (Baker-FRC)

OZONE WATER TREATMENT SYSTEMS,

PCI Ozone Corp., West Caldwell, NJ.
C. Nebel.
Water/Engineering and Management, Vol REF, No HB, p R77-R80, 1981. 8 Fig, 1 Tab.

Descriptors: *Ozonation, Solubility, Dissolved solids, *Water treatment, *Potable water, Disinfection.

When ozone is used to treat potable water, it must be transferred from the air in which it was generated to the liquid phase. This is called mass transfer. Several variables affect mass transfer, including dissolved organic materials which react chemically with ozone. The amount required in a treatment plant is largely dependent on the amount of dissolved organic materials in the water. Water temperature plays an important role. Decreasing water temperature increases the solubility of ozone. Mixing increases the rate of ozone mass transfer by thinning the liquid interfacial film. Mixing also increases the rate at which residual ozone is destroyed, which in turn decreases the rate of microorganism inactivation. Bubble size affects ozone transfer, which is increased by having the maximum area available between the water and the ozonated air. Slowing the ascent speed of bubbles will also increase transfer efficiency, water depth in an ozone contactor can serve as a means to increase the contact time between the bubbles and the water. Contact time is significant to disinfection. The speed of disinfection by ozone has been observed to be significantly faster than disinfection by chlorine. Higher pH values catalytically destroyed ozone residuals in water by interaction with the hydroxyl ion. Since most ozone contacting systems do not transfer all the ozone from its carrier gas to the water, the off-gases from the contactor contain small amounts of ozone. There are many methods of off-gas treatment including dilution, decomposition of ozone by granular activated carbon, catalytic destruction, thermal destruction, and off-gas reinjection. (Baker-FRC)

CARBON TREATMENT OF DRINKING WATER: N.J. PLANT TRYING TO GET OUT THE BUGS,

G. Dallaire.
Civil Engineering (New York), Vol 50, No 1, p 64-67, January, 1980. 3 Fig.

Descriptors: *Activated carbon, *Organic compounds, *Regeneration, Water treatment, Trace levels, *Passaic, *New Jersey, Filtration, Adsorption, Pilot plants.

The Passaic Valley, New Jersey, water treatment plant has been experimenting with activated carbon for removing the numerous synthetic organic chemicals in its raw water source. Trace synthetic organics removal is not to be equated with removal of odor, taste, and turbidity by activated carbon filters, an effective process in common use. Water filters through a 33 inch deep bed of granular activated carbon in 8 ft x 28 ft tanks. After two years of work, the percentage of organics removed and the best type of activated carbon has not yet been determined. Problems and unknowns include the desorption of chemicals into the effluent, frequency of regeneration, strict standards on regeneration, corrosion of equipment, and moving the carbon to the regeneration furnace. In experiments at the Jefferson Parish Water Department, New Orleans, it was established that a 20 min contact time is necessary for organics removal. Large molecules such as pesticides are moved more effectively than small molecules such as trihalomethanes. Problems with activated carbon treatment can be engineered out by constructing 2 to 4 full-scale demonstration carbon treatment plants so that each water works will not have to 'reinvent the wheel.' However, some communities have immediate problems with organics and cannot wait for information from demonstration projects, which is at least five years away. (Cassar-FRC)

MIXED BED TECHNOLOGY FOR POLISHING MAKE-UP WATER AND CONDENSATE RETURN, PART ONE,

R. A. F. Scott.
Effluent and Water Treatment Journal, Vol 21, No 3, p 113-115, 117-120, March, 1981. 4 Fig, 3 Tab, 20 Ref.

Descriptors: *Iron exchange, *Resins, *Boiler water, *Condensates, *Water treatment, Water purification, Regeneration, Fouling, Filtration, Anion exchange, Cation exchange.

This paper presents the current state of technology of the mixed bed process for polishing condensate return or water substantially deionized by preceding processes. The regeneration sequence for the mixed anion-cation resin involves backwash, settling, caustic regeneration and rinse, acid regeneration and rinse, air mixing, and final rinse. Technologies available to ease organic fouling problems are the total organic carbon analyzer for monitoring low levels of organic matter and improved acrylic base resins. Silica leakage may be minimized by removing silica by a working anion unit prior to the mixed bed polisher, by the countercurrent technique, or using the Hipol process. Recommendations for the minimum regeneration level are 64 g NaOH per liter anionic resin and 48 g H2SO4 per liter of cation resin. Service flow rates as high as 50 meters per hour are conventional. Specifications for polished condensate are given, with 1 ppb maximum levels for NaCl and Fe in the U.S. Sources of contamination in the condensate are boiler feed makeup water, chemical additives, corrosion and erosion products, air ingress, condenser leakage, and reserve feed water. Although the first mixed bed polishing units had filtration units installed ahead of the ion exchange section, more recent technology uses the polisher itself as a highly efficient filter. Other methods of improving filtrate efficiency are precation units to protect against iron and powdered resins for precoat filtration. Using the mixed bed unit as a filter can cause physical and/or chemical fouling. Techniques for solving these problems are backwashing, air sparging, air bump-rinse out, external resins regeneration, ultrasonic resin cleaning, sub-surface washes, and split bed polishers. OUTLOOK FOR WATER AND WASTEWATER SYSTEMS, PROCESSES, AND EQUIPMENT: COMMENTS FROM METCALF AND EDDY, INC., BOSTON, MA,

J. E. Moore.
Water/Engineering and Management, Vol 128, No 3, p 90, March, 1981.

Descriptors: *Wastewater treatment, *Water treatment, *Equipment, Drinking water, Projections, Sludge utilization, Energy conservation, Energy production, *Water treatment facilities.

Metcalf and Eddy, Inc., presents its predictions with respect to water and wastewater treatment

developments. The water treatment industry may expect an increase in the need for waterworks treatment equipment and systems as a result of implementation of the Safe Drinking Water Act. This is particularly true in areas where systems will be required to switch from simple chlorination to full treatment for the removal of turbidity. The wastewater treatment industry can expect continuation of the present major interest in energy saving equipment. Increased interest in the reuse of wastewater for agricultural purposes or aquifer recharge and in sludge recycling for agricultural use or as an energy source can also be anticipated. Manufacturer equipment sales are decreasing. In addition, the quality of equipment has generally decreased with increased competition, as has the willingness of manufacturers and suppliers to provide maintenance assistance and general service. A NOVEL CHLORAMINE COMPOUND FOR WATER DISINFECTION,

Auburn Univ., AL. Dept. of Chemistry.
H. D. Burkett, J. H. Faison, H. H. Kohl, W. B. Wheatley, and S. D. Worley.
Water Resources Bulletin, Vol 17, No 5, p 874-879, October, 1981. 4 Tab, 33 Ref.

Descriptors: *Disinfection, *Chloramines, Chlorination, *Water treatment, Toxicity, Solubility, Bactericides, 3-chloro-4,4-dimethyl-2-oxazolidinone, Water purification.

3-chloro-4,4-dimethyl-2-oxazolidinone (Agent I) was an effective disinfectant in a laboratory scale water treatment plant. Bacterial counts in raw water treated with Agent I were reduced from about 10 million per cc to about 1,000 per cc using a nutrient-agar (total colony count) detection technique. In all, 10 runs were made, using aluminum sulfate, lime, sodium silica fluroide (SIC), and Agent I alone and in combination. Best results were obtained (500-600 bacteria per cc) with lime, aluminum sulfate, Agent I, with or without added solution for at least 6 weeks in darkness or light and to 1 hour exposures of ultraviolet light. Solubility in water is 0.8 g per 100 cc at 2 c and 1.2 g per 100 cc at 28C. It has an apparent anticorrosive effect on metals. No toxicity was observed in 4 laboratory rats fed 10 to 200 ppm Agent I for 6 months. The slow release of chlorine provides prolonged bactericidal action. It is less likely to produce chlorinated hydrocarbons in the treated water. This compound shows potential for treating small water supplies such as wells and military field units. (Cassar-FRC)

REPLACING LARGE WATER METERS: WHY AND HOW,

Rockwell International, Atlanta, GA.
F. L. Russell.
Water/Engineering and Management, Vol 128, No 10, p 66, 68, 73, 1981. 3 Fig.

Descriptors: *Water metering, *Maintenance, Cost analysis, *Economic aspects, Water supply systems, Water meters, Water delivery, Pipelines.

During a recent in-the-field large meter test program, a significant number of units were found to be losing tens of thousands of dollars of revenue each year due to inaccuracy and obsolescence. These amounts of losses were far in excess of the cost of replacement of the malfunctioning units. In cases where there is a pressing need to maintain service during repairs, a temporary or permanent bypass must be installed around the meter if none exists. A temporary bypass made with service saddles, tapping valves and either fire hose or hard pipe can be used if the volume of water that can be supplied will be adequate. The primary problems to be anticipated in replacing a large water meter that has been in service for a lengthy period include difficulty in removing the old meter, as it has become bound into the pipeline as a result of lateral pressure; the possibility that the line will expand laterally into the gap when the old meter is removed and make it difficult to install a new meter of the same laying length; and a need for spool pieces and/or reducers to make up differences in size between the old meter and the new one. After the new meter has been installed with all connections secure, the valves must be slowly and partially opened in reverse order of the shutdown to allow the lines to fill slowly and reestablish pressure. (Baker-FRC)

DOWN TO EARTH LEAK DETECTION,

Water Treatment Plant, Traverse City, MI.
R. Bowen.
Water/Engineering and Management, Vol 128, No 10, p 62, 65, 1981.

Descriptors: *Leakage, Water conservation, Water loss, *Water supply systems, Valves, Hydrants, Measuring instruments, Maintenance, *Traverse City, *Michigan, Case studies, Pipelines.

In Traverse City, Michigan, a project was undertaken to determine where leaks in the water supply system were located and what was going on under the streets of the city. Practical experience indicates that any loss above 10% is worth some effort to control and that if losses are 20% or more a loss control program which includes leak detection is certainly called for. In Traverse City the loss was 35-40%, with increasing electrical costs. Assumptions were made that losses were due to official hydrant use, unknown unmetered use of water, and underground water leakage. A log was started to record the official use of hydrant water. Unmetered usage is hard to control. Underground leakage was investigated by use of an instrument designed for this purpose. After an examination during a quiet time for water usage, about 15% of the hydrants in the city were identified as noisy, indicating water leakage. Areas with two noisy hydrants in succession were examined first, as they indicated possible larger areas of concern. A check of the storm sewers was then made. If a flow was found it was sampled for chlorine and fluoride, the two chemicals added to city water and not found in groundwater. Suspected leaks were then pinpointed. Various factors which affect leak detection should be considered during operator training. Leak noise can vary according to conditions associated with the leak. Some general guidelines are offered. (Baker-FRC)

URBAN WATER SYSTEMS: PROBLEMS AND ALTERNATIVE APPROACHES TO SOLUTIONS,

Army Corps of Engineers, Belvoir, VA.
K. E. Schilling.
Journal of the New England Water Works Association, Vol 95, No 3, p 178-186, September, 1981.

Descriptors: Water supply, *Government supports, Urban areas, Water resources development, Financial aspects, Planning, Decision making, Administrative decisions, Federal jurisdiction, Political aspects, *Municipal water, *Water supply systems, Costs.

The Subcommittee on Urban Water Supply of the President's Intergovernmental Water Policy Task Force has commissioned an inventory of existing Federal programs with potential for assisting urban water system rehabilitation or construction; identified and evaluated institutional and money problems connected with supply and distribution of municipal water; and identified and assessed policy and program changes at the Federal, state and local level. Urban water system capital expenditures needed over the next 20 years are estimated to total $75-$110 billion. As many as two out of every ten urban water systems might experience capital investment shortfalls over the next 20 years. The shortfall thus created could range between $5-$26 billion. About one half of the total estimated national shortfall is attributed to distribution system needs and one-third to new source development needs. Municipally owned and operated water systems are four times as likely to experience shortfalls as privately owned systems. Federal categorical programs which supply assistance specifically for water supply purposes have limited applicability to urban water supply problems. Some Federal assistance programs do provide substantial sources of funding assistance which could be directed to water supply. The subcommittee suggests that the selection and implementation of any one or combination of policy approaches should occur in conjunction with a more detailed study of urban water resource problems to reduce uncertainties as implementation proceeds. KINETICS OF TRIHALOMETHANE FORMATION IN LYOPHILIZED POTOMAC WATER,

Howard Univ., Washington, DC. Dept. of Chemical Engineering.
M. M. Varma, R. C. Chawla, A. Balram, and H. M. Katz.
AIChe Symposium Series, Vol 77, No 209, p 220-226, 1981. 9 Fig, 6 Ref.

Descriptors: *Chlorination, *Trihalomethanes, *Kinetics, *Water treatment, Model studies, *Potomac River, Chlorinated hydrocarbons, Chloroform, Organic compounds, Fate of pollutants.

The solid residue from 20 gallons of lyophilized Potomac River water was resuspended in water and chlorinated to study trihalomethane formation. At a Cl dose of 2 mg per liter and solids concentration of 115 mg per liter, about 18 micrograms per liter trihalomethanes (mostly chloroform) formed within 6 hours. The trihalomethane concentration increased with increasing Cl dose, but not linearly. Chloroform formation also increased with increasing solids concentrations from 15 to 150 mg per liter. At the higher solids concentrations chloroform formation also increased with time up to 100 hours. A simple semiempirical model is given to use for this water. It should be applied with caution to other water sources or for the same water under drastically different conditions. (Cassar-FRC)

INTRAPARTICLE DIFFUSIVITY OF METHYLENE BLUE INTO POROUS ACTIVATED CARBON,

Tokushima Univ. (Japan). Faculty of Pharmaceutical Sciences.
K. Boke, S. Tanada, T. Matsui, T. Kuwahara, and A. Kotani.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 610-615, November, 1981. 4 Fig, 1 Tab, 12 Ref.

Descriptors: *Activated carbon, *Adsorption, *Diffusivity, Water treatment, *Methylene blue, Pore size, *Water pollution treatment.

The variation of the intraparticle diffusivities with the adsorption ratio up to 0.2 and the relationship between intraparticle diffusivity and pore size distribution of activated carbon were investigated. This information is essential for transferring from a batch adsorption system to a column adsorption system in water pollution treatment. Methylene blue was the adsorbate. A figure shows Freundlich plots (constants 19.12 to 176.60) of the adsorption isotherms of methylene blue on five activated carbons ranging in particle diameter from 4.08 to 4.65 mm and surface area from 378.6 to 1364.5 sq meters per g. The results of another figure imply that intraparticle diffusivities change with adsorption ratio. Methylene blue was mainly adsorbed in the micropores of activated carbon (pore diffusivity predominating over surface diffusivity) in the early stages of adsorption. The relationship between the intraparticle diffusivity and pore size distribution is illustrated by curves. (Cassar-FRC)

OPTIMIZING COAGULATION WITH PILOT FILTERS AND ZETA POTENTIAL,

American Water Works Service Co., Inc., Haddonfield, NJ.
W. E. Neuman.
Journal of the American Water Works Association, Vol 73, No 9, p 472-475, September, 1981.

Descriptors: *Coagulation, *Zeta potential, *Pilot plants, *Control systems, Filters, Chemical coagulation, Alum, Jar tests, *Water treatment, Turbidity, Monitoring, Quality control.

Zeta potential and pilot filters are practical testing techniques for coagulation control in water treatment plants. Zeta potential measures the strength of the negative change on the colloidal particles (turbidity) in raw water by adding a cationic coagulant to determine if cationic additions result in adequate neutralization of the negative charge. The velocity of migrating particles is measured by applying a direct current voltage across a sample cell. Examples of successful applications of zeta potential are given: latex spills into a river water supply, high turbidity values at winter temperatures, sludge blanket breakthroughs, and a daily afternoon peak in alum dosage. In all four cases zeta potential indicated much lower coagulant dosages than did other methods. In-line pilot filters provide instant alerts of change and keep a record of performance. Use of either of these two monitoring methods leads to more accurate chemical dosages, better understanding of filter processes, and a more uniform water quality. (Caesar-FRC)

UPGRADING TO INCREASE TREATMENT CAPACITY,

Environmental Science and Engineering, Inc., Gainesville, FL.
T. P. Brodeur.
Journal of the American Water Works Association, Vol 73, No 9, p 464-471, September, 1981. 15 Fig, 2 Tab.

Descriptors: *Flocculation, *Filtration, *Water treatment facilities, Upgrading, *Cost-benefit analysis, Manatee County, *Florida, Coagulation, Alum, Color removal, Sludge lagoons, Sludge thickening, Pilot plants, Costs, Water supply.

The Manatee County, Florida, water treatment plant was upgraded, enabling a 46% expansion to 54 mgd at capital cost savings of $2 million and energy savings of $10,000 per year. New filters were added. Two mechanical rapid mixers and twelve 40 hp mixers were eliminated. Flocculator units were divided into 8 compartments each. Perforated baffles were added to the settling basins for better distribution of flocculated water. Alum dosage was reduced from 70 to 50 mg per liter. Raw water colors were high, 151-200 pcu. Finished water colors before plant modification were 18-23 pcu, and after modification, 10 pcu or less. The effectiveness of the sludge lagoons was increased by allowing sludge to thicken to 2-3% in settling basins prior to discharge into the lagoons. (Caesar-FRC)

UPGRADING WATER TREATMENT PLANTS IN SAN DIEGO,

San Diego Water Utilities Dept., CA.
R. W. King, and E. I. Crossley.
Journal of the American Water Works Association, Vol 73, No 9, p 476-477, September, 1981. 1 Fig.

Descriptors: *Water treatment facilities, *Flocculation, Filter media, Filtration, Upgrading, Mixing, *San Diego, California, Water supply.

The City of San Diego, California, modified two of its three water treatment plants to increase capacity by 30% without changing the physical size of the plants or the water quality. The filter media was changed from sand to anthracite-sand, filter controllers were modified, and high energy mixers replaced rapid mixers and some flocculators. These modifications also handled a concurrent change in raw water quality. Previous supplies from the Colorado River needed only chlorination. The new supply was half Colorado River water and half from northern California, which required full treatment. (Caesar-FRC)

DECLINING-RATE FILTRATION,

Iowa State Univ., Ames. Dept. of Civil Engineering.
J. L. Cleasby.
Journal of the American Water Works Association, Vol 73, No 9, p 484-489, September, 1981. 7 Fig, 2 Tab, 13 Ref.

Descriptors: *Filtration, *Water level fluctuations, *Head loss, *Water treatment, Declining rate filtration, Turbidity, Pilot plants, Design criteria.

The use of declining-rate filtration is increasing in new water treatment plants. In this operation the filtration rate is allowed to decline from a maximum value in the beginning of the run when the filter media is clean to a minimum value when backwashing is done. Two pilot plant runs, one declining-rate filtration (DRF) and the other constant rate filtration (CRF), were operated at 3.39 mm per sec. The DRF produced better water, showed no terminal turbidity breakthrough, and had about 1/3 longer filter run than the CRF method. Differences in water quality were greater when the CRF was allowed to run to a breakthrough of 1 turbidity unit than when the two plants were operated by the same terminal head loss in the media. To convert an existing constant-rate or constant-head plant to declining-rate filtration the total head loss and variations in water level must be determined, preferably by pilot tests. Alternatives for plant conversion are: (1) installing a vented loop in the effluent pipe to limit the total head loss across the filter and fix the maximum water level at the desired position, (2) installing a vented overflow weir box in the effluent pipe, (3) installing a weir or an upturned pipe in the clear well, (4) installing an orifice or fixed position valve in the effluent pipe, and (5) converting the effluent valve to a two-position valve. Methods are given for estimating the changes in water level during backwashing operations in a multiple filter unit. The rise in water level decreases with increasing number of filters and increases with longer backwashing periods. (Caesar-FRC)

REMOVING COLOR AND CHLOROFORM PRECURSORS FROM LOW TURBIDITY WATERS BY DIRECT FILTRATION,

Stearns and Wheler, Cazenovia, NY.
L. E. Scheuch, and J. K. Edzwald.
Journal of the American Water Works Association, Vol 73, No 9, p 497-502, September, 1981. 13 Fig, 4 Tab, 27 Ref.

Descriptors: *Filtration, *Color removal, *Organic matter, *Water treatment, Direct filtration, Humic acids, Chlorinated hydrocarbons, Chloroform, Flocculation, Polyelectrolytes, *Raquette River, *New York.

Direct filtration of colored raw waters was evaluated using bench-scale pilot tests. Synthetic waters with colors of 55 pcu (5 mg per liter humic acid) and 110 pcu (10 mg per liter humic acid) and Raquette River, New York, water of 40 to 70 pcu color and low turbidity were treated with a cationic polyelectrolyte. Dosages of polymer were determined by jar test and varied from 3.5 to 8 mg per liter. Color reductions were as follows: 55 pcy water, 90%; 110 pcu water, 95%; Raquette River water, 75-83%. Chloroform precursors were reduced 50-60% for the synthetic waters and 40% for the river water. (Caesar-FRC)

COMPARATIVE PERFORMANCE OF DUAL- AND MIXED-MEDIA FILTERS,

Minneapolis Water Works, MN.
N. Qureshi.
Journal of the American Water Works Association, Vol 73, No 9, p 490-496, September, 1981. 7 Fig, 4 Tab, 10 Ref.

Descriptors: *Filters, *Performance evaluation, *Water treatment, Mixed media filters, Dual media filters, Sand filters, Filtration, Filter media, Comparison studies, Costs.

There was very little difference in performance between dual media (coal and sand) and mixed media (anthracite, sand, and high density sand) filters in pilot and plant scale tests conducted in the Minneapolis Water Works. In the initial stages of filter operation, the mixed media produced a slightly less turbid water than the dual media. A break-even point was reached at 24 hours, after which the dual media increased gradually in performance. The dual media had slightly lower head loss and equal or larger filter runs than the mixed media. Results of these findings and of previous work at other locations do not substantiate the belief that mixed media is superior to dual media, which costs $3.25 less to install than mixed media. These results should not be applied to other situations without considering variations.in water quality and equipment. (Caesar-FRC)

METHODS FOR EVALUATING PERFORMANCE OF FILTER MEDIA,

Metcalf and Eddy, Inc., Boston, MA.
S. L. Bishop.
Journal of the New England Water Works Association, Vol 95, No 3, p 193-207, 1981. 10 Fig, 3 Tab, 4 Ref.

Descriptors: *Filter media, *Evaluation, *Water treatment, Water treatment facilities, Reverse osmosis, Turbidity, Head loss, Microscopic analysis.

Techniques used in evaluating the performance of filter media are discussed. These techniques involve evaluating either the quality or quantity of filtered water to determine optimal operating conditions. Quality considerations include turbidity, conditions. Quality considerations include turbidity, microscopic count, suspended solids, or the silt density index, while quantity considerations include the net unit production of water. The evaluation of the internal distribution of head loss is of interest in adjusting filter design during piloting of water processes. Measuring turbidity as an evaluation of the performance of granular media filters has limitations, as it is not an accurate indicator of the amount of suspended material in the water. Filtered water also contains quantities of amorphous material and plankton which are not detected in turbidity measurements. For these reasons microscopic analysis of filtered water has been used in many cases as a supplement to the standard use of turbidity in determining the performance of water treatment processes. Microscopic analysis has an inherent statistical problem involving the theory of random sampling and a human problem involving procedural errors or variations in the laboratory. These problems must be considered in each case. Studies have indicated that the multi-media filter is more efficient than the dual media filter in removing microscopic material and turbidity, even at twice the normal filtration rate. No relation could be found between the microscopic cound and the duration of filter run to a set terminal head loss. Suspended solids are not useful as an indicator of filter media performance because of procedural limitations involved in measuring their low values in filtered water. (Baker-FRC)

VINYL LINED ASBESTOS CEMENT PIPE PROBLEMS-HEALTH ASPECTS,

Dept. Environmental Quality Engineering, MA.
P. T. Anderson.
Journal of the New England Water Works Association, Vol 95, No 3, p 217-219, 1981.

Descriptors: *Pipes, *Water pollution sources, Chemical compounds, *Asbestos, Cement, Vinyl, Linings, Coatings, Organic compounds, *Water treatment, Drinking water.

The finding of tetrachloroethylene (TCE) in drinking water from public water supplies using vinyl lined asbestos-cement pipe was first noted in Massachusetts in late January of 1980. Additional investigation suggested a problem in the low flow

situations in vinyl lined AC mains with TCE levels significantly over the 40 ppb recommended safety level. In the state of Massachusetts there were about 94 public water supplies involved, with about 644 miles of vinyl lined AC pipe. Various steps have been tried thus far to solve the problem. Faucet aeration proved ineffective. Dilution was effective but impractical. Impractical also was steam cleaning and sand blasting. Addition of a cement lining resulted in a 97-99% reduction but the long term effect is not known and the cost is $10-$15 per foot. Flushing was effective, but also wasteful and difficult to monitor. Bleeding was generally effective. Carbon filtration was effective under 800 ppb but cartridge life was a problem. Five minutes of vigorous boiling at 2 inches deep removes 99%, but many concentrate other chemicals. Adjustment of pH, polyphosphate addition and super chlorination were not effective. Pipe replacement was effective but very expensive. (Baker-FRC)

CENTRAL CITY DEMANDS IN THE 80'S WOONSOCKET, RHODE ISLAND,
H. V. Patterson.
Journal of the New England Water Works Association, Vol 95, No 3, p 224-228, 1981.

Descriptors: *Water conveyance, *Financial aspects, *Water supply, Water rates, Economic aspects, Planning, Water management, Water distribution, Water delivery, Pipelines, Water mains, Conveyance structures, Water demand, *Woonsocket, *Rhode Island.

The existing water supply system in Woonsocket, Rhode Island is reviewed, and needs for the future are described. Before 1885 a reservoir (number 1) was constructed with an available water capacity of 30 MG, a pumping station was built, and the first water mains installed. The water company as such became municipally owned in 1885 at a cost of $280,000. It has never become self-sustaining. The Crook Fall Brook has remained the major source of supply, and is of very high quality. A second reservoir was built, but washed out in the early 1890's; a third one was built later. Chlorination was the only chemical treatment employed prior to building the new plant in 1962. Woonsocket's Central Area comprises 3 square miles. Sixteen of the 44 miles of pipe laid before 1900 are nominal 4 and 6 inches in size, unlined cast iron, which should be replaced. A bond issue was floated seven years ago to repaint and refurbish the water tanks and begin other repairs. However, the first tank examined was in such bad shape that most of the money went for it. Efforts are also underway for fire hydrant renewal. The greatest handicap in all the problems is the dependency on the general fund of the city. (Baker-FRC)

BAYANIHAN, THE SPIRIT BEHIND THE PHILIPPINE WATER SUPPLY DEPARTMENT SCENE.
Aqua, No 6, p 7-9, 1981.

Descriptors: *Water resources development, *Water supply, *Water demand, Resources development, *Philippines, Urban areas, Rural areas, Drinking water, Potable water, Water management, Metropolitan water management.

The spirit of self-help lies behind the attempts being made in the Philippines to promote the drinking water supply development program. At the start of the 1970's a study indicated that the water works systems which were installed by the National Waterworks and Sewerage Authority (NAWASA) were not maintained properly and were breaking down at a much faster rate than rehabilitation and repairs could manage. Through a presidential mandate in 1973 the control of Philippine water supplies was placed under three separate agencies. The Metro Manila area and some six adjacent municipalities of the provinces of Cavite and Rizal fall under the responsibility of the Metropolitan Waterworks and Sewerage Systems (MWSS), with the rest of the country divided between the Local Water Utilities Administration and the Rural Waterworks Development Corporation. The RWDC undertakes development of water supplies in areas with less than 20,000 population. The LWUA handles water needs of cities and municipalities outside Metro Manila with more than 20,000 population. The water district is owned, operated, managed and controlled by the people themselves once it is operational and has settled obligations with the LWUA. Thus its development depends on the people in the locality it serves. Because of the popularity of the self reliance concept in the Philippines, this concept of water supply development is making great strides. (Baker-FRC)

DEVELOPMENT OF WATER SUPPLY TO METRO-MANILA.
Aqua, No 6, p 10-15, 1981. 5 Fig, 1 Tab.

Descriptors: *Water resources development, *Water supply, Dams, Reservoirs, Resources development, Water demand, Urban areas, *Manila, Philippines, *Metropolitan water management.

In August of 1975 the Manila Water Supply Project II began for the purpose of developing fully the present major source at Angat River, carrying out rehabilitation and extension of the water distribution system, and transforming the Metropolitan Waterworks and Sewerage System (MWSS) into an efficient public utility. The first effects of the project were recently felt with the completion of modifications to the Balara Water Treatment Plant, the partial operation of a new aqueduct, and the installation of additional distribution mains. The total Project cost is about US $416.0 million, of which $185.3 million is the estimated foreign exchange. Construction and commissioning the new La Mesa Water Treatment Plant is an integral and critical part of the Project program. Total completion and operation is scheduled for February 1982. Water to be treated at the La Mesa Plant will come from the Angat-Ipo supply system. This consists of the Angat multi-purpose dam, which discharges through power turbines to the Angat River and thence to the Ipo Diversion Dam, and then through tunnels and closed aqueducts to the Novaliches Reservoir. Prior to entering the Reservoir, the water will be diverted into an open channel to the La Mesa Treatment Plant. The new Ipo Dam is located on the Angat River near its confluence with the Ipo River in the Province of Bulacan. The dam will double the present water supply capacity to Manila. The project consists of building both the dam and the necessary flood and self-regulating radial gates and other material. (Baker-FRC)

WATER SOFTENING BY CRYSTALLIZATION,
Amsterdam Waterworks (Netherlands).
I. A. Graveland.
Aqua, No 2, p 3-4, 1980. 3 Fig.

Descriptors: *Water softening, *Hardness, *Crystallization, Calcium carbonate, *Water treatment.

A water softening process uses sodium hydroxide to increase pH and cause calcium carbonate to crystallize on marble grains in a fluidized bed. Once every day or two the larger two mm grains are removed from the bottom, and new seeding sand is added. These marble grains may be used in industrial applications. Hardness is reduced from five to three meq per liter at pH 8.5. Heavy metals are almost completely removed, but organic compounds are not. Additional costs for central water softening per family in Holland are estimated at two pounds a year, with a ten pounds per year savings in washing powder and equipment maintenance. (Caesar-FRC)

5G. Water Quality Control

A CONTROL MODEL FOR PHOSPHORUS LOADING REDUCTION UNDER UNCERTAINTY,
Mining Development Inst., Budapest (Hungary).
I. Bogardi, L. Duckstein, and F. Szidarovszky.
Ecological Modelling, Vol 12, No 1, p 83-103, March, 1981. 6 Fig, 8 Tab, 38 Ref.

Descriptors: *Eutrophication, *Phosphorus, *Model studies, *Water quality control, Nutrients, Water quality management, Lakes, Snowmelt, Fertilizers, Erosion control, Sediment yield, Land use, *Nutrient loading control, Lake Balaton, Hungary.

An investigation into the control of nutrient loading to prevent eutrophication was made using a system model of Lake Balaton, Hungary. The model was composed of the state vector consisting of dissolved P and sediment-fixed P and the probability density (pdf) of these values. Six pure strategies concentrating on the control of point source pollution, fertilizer, erosion, land use, runoff, and sediment yield are used to define eight mixed alternatives. The measure of effectiveness of control has been taken as the relative frequency (uj) with which alternative j results in the highest loading reduction, in order to account for the stochastic character of loading. Under the data and conditions for the sub-watershed of Lake Balaton, the most effective treatment for the control of nutrient loading appears to be tertiary wastewater treatment. Stochastic models of snowmelt which may increase P-loading under no-till agricultural systems may also be used within the event-based framework of the present model. (Geiger-FRC)

U. N. LAUNCHES INTERNATIONAL WATER DECADE; U. S. ROLE UNCERTAIN,
G. Dallaire.
Civil Engineering (New York), Vol 51, No 3 p 59-62, March, 1981.

Descriptors: International Hydrolic Decade, Rural areas, *Public health, Sanitary engineer, Sewage treatment, *Potable water, *Waste disposal, Foreign countries, Governments, Engineering, Diseases, Water pollution, United Nations, *Water quality control, Drinking water.

Constraints to achieving the goals of the United Nations' International Water Decade are governmental commitment and motivation, managerial ability, manpower and training on all levels (from professional to laborer and handyman), appropriate technology, and money. Many developing countries consider industrial, agricultural, transportation, and power development much more important than water and sanitation. In some cases advanced technology is used to construct expensive, complicated treatment plants which cannot be maintained, whereas simple latrines or the double vault method can greatly improve sanitation. When engineering students from developing countries returned to their homelands, many took desk jobs and failed to spread their knowledge to the villages and rural areas. Although rural areas have severe problems from improper waste disposal and polluted drinking water, the problems in rapidly

growing third world cities are worse. As yet, United States consultants have not been involved significantly in these developing countries. Many have not had experience in simple, low cost technologies. The United States would benefit from involvement in the Water Decade because some diseases common to the third world are finding their way to the Western world. In addition, the developing countries supply some necessary raw materials as well as consuming American products and services. (Caesar-FRC)

RAPID SEWER ANALYSIS SAVES TOURIST SEASON,

M. Garbrecht.
Consulting Engineering (St. Joseph), Vol 54, No 4, p 148, 150, 152, April, 1980.

Descriptors: *Sewer infiltration, *Rehabilitation, *Cape May, New Jersey, *Water pollution control, Inspection, *Sewer systems, Maintenance.

Cape May, New Jersey, a seaside resort town with sewer service to 150,000, completed sewer inspections and repairs before the tourist season, worth more than $100 million, opened. The beaches had been closed by the state because of the high level of fecal coliforms entering the ocean and Delaware Bay from the defective system. Initial investigations covered the total collection system, 150,000 feet of mains and six pumping stations. Infiltration/inflow measurements eliminated two subsystems from study, and work concentrated on the 83,000 feet most likely to produce the remaining infiltration/inflow. Subsequent investigations concerned location of pollution from the storm drains and location of sources which caused surges and sewage treatment plant by-passing. About 35% of the infiltration/inflow sources were repairable and 42% of the manholes needed water-tight covers. All work from specifications development to major corrective work was done within six months, at a total cost less than the estimated $1.635 million. (Caesar-FRC)

THE EFFECT OF ARTIFICIAL DESTRATIFICATION ON PHYSICO-CHEMICAL PARAMETERS AND PHYTOPLANKTON IN HAM'S LAKE, OKLAHOMA,

Oklahoma State Univ., Stillwater.
H. N. Chau.
PhD Thesis, December, 1980. 135 p, 18 Fig, 19 Tab, 116 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-13298.

Descriptors: *Water quality, *Lakes, *Mixing, *Destratification, *Environmental effects, Nutrients, Phytoplankton, Standing crops, Physicochemical parameters, *Ham's Lake, *Oklahoma.

Physico-chemical parameters of water quality and the standing crop of phytoplankton were observed during three comparable periods in 1976, 1977, and 1978 in Ham's Lake, Oklahoma. The objective was to determine the ecological effect of artificial mixing on the lake, which was artificially mixed during 1976 and 1978, but not in 1977. The major findings were as follows. Artificial mixing created isothermal conditions by raising the temperature between the bottom and 4 m. The larger axial flow pump of 1.6 m destratified the lake better than the smaller one of 1.1 m (diameter). Artificial mixing reduced the transparency of the Secchi disc. Anoxic conditions in the hypolimnion were eliminated by artificial mixing. Artificial mixing reduced free carbon dioxide at the bottom of the lake causing an increase in pH. Free carbon dioxide at the surface did not increase, probably due to higher rates of photosynthesis. Total alkalinity was isochemical with respect to depth during mixing. The concentration of nitrate was slightly higher during experimental years. The concentration of ammonia was lower in 1978 than in 1976. The concentration of sulfide decreased during artificial mixing. Phosphate was detected more often during the experimental years. Concentrations of chlorophyll a were higher during the experimental years. Artificial mixing encouraged the growth of the diatoms, Cyclotella, Melosira, and Navicula but discouraged the blue-green algae, Microcystis and Anabaena. Horizontal variability in water quality parameters and chlorophyll a was observed at Ham's Lake. (Sinha-OEIS)

IRRIGATED AGRICULTURE AND NITRATE POLLUTION OF RURAL WATER SUPPLIES: ECONOMICS FOR POLICY IN CENTRAL WISCONSIN,

Wisconsin Univ.-Madison. Dept. of Agricultural Economics.
R. C. Griffin.
PhD Thesis, 1980. 333 p, 9 Fig, 10 Tab, 234 Ref. University Microfilms International, Ann Arbor, MI; Order NO GAX81-02202.

Descriptors: *Groundwater pollution, *Water pollution control, *Agriculture, *Economic aspects, Water policy, Irrigation, Nonpoint pollution sources, Agricultural watersheds, Agricultural wastes, *Nitrates.

The economic structure which characterizes the nitrate pollution of groundwater by irrigated agriculture in the Wisconsin Central Sands Region is examined. The major emphasis is the development of a theoretical and methodological framework for evaluating problems involving agricultural pollution. The primary feature characterizing agricultural instances of pollution is their 'nonpoint' nature. 'Nonpoint production functions' are used to identify the technical relationships between nonpoint pollution generation and agricultural activities. This concept leads to several alternative policy proposals as well as specific policy parameters for use in non-point situations. Two additional concerns which are related to agricultural pollution involve the spatial nature of groundwater contamination and the 'policy transaction costs' to be encountered during policy implementation and maintenance. Policy transaction costs refer to the administrative and information costs which accompany the implementation of any pollution-control policy. These costs can be substantial in nonpoint situations, and the efficiency and effectiveness of alternative policy programs is shown to be related to these costs. Current economic procedures for analyzing policies and current nonpoint policy are critiqued and found to be deficient in several regards. Needed improvements in these procedures and institutions are suggested. (Sinha-OEIS)

GROUNDWATER MONITORING STRATEGIES TO SUPPORT COMMUNITY MANAGEMENT OF ON-SITE HOME SEWAGE DISPOSAL SYSTEMS,

Colorado State Univ., Fort Collins. Dept. of Agriculture and Chemical Engineering.
J. D. Nelson.
PhD Thesis, 1980. 147 p, 15 Fig, 8 Tab, 76 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-22416.

Descriptors: *Water pollution prevention, *Water pollution sources, Groundwater, *Groundwater pollution, Monitoring, Domestic wastes, Septic wastewater, Mathematical models, Sampling, *Wastewater management, Septic tanks.

Organizations which provide centralized management of on-site sewage disposal systems are currently evolving in many areas of the United States. At present, there is no routine feedback for management agencies regarding their efforts in preventing ground water contamination. Ground water monitoring is necessary to provide these agencies with the information they need to maintain ground water quality. This research is directed toward supplying monitoring strategies for that purpose. Ground water monitoring strategies presented here were developed by combining deterministic and probabilistic approaches. Two types of monitoring are defined which need to be incorporated into an overall management plan. Inspection monitoring strategies are developed in terms of the sampling frequencies necessary to obtain a specific probability of detecting system failure. A mathematical model describing the flow of pollutants through the leach field is developed for the purpose of evaluating sampling plans and a sensitivity analysis is performed to determine the effect of varying the parameters of the system and the input to the leach field. The discussion of trend monitoring strategies is based primarily on existing statistical theory. Sampling frequency is discussed in terms of the number of samples required to obtain an estimate of the mean of a water quality variable within specified confidence limits. The effect of spatial and serial correlation is also considered. Finally, a discussion of various sampling techniques applicable to ground water monitoring is presented. (Sinha-OEIS)

ANALYSIS OF WASTE LOAD ALLOCATION PROCEDURES,

Villanova Univ., PA. Dept. of Civil Engineering.
R. A. Chadderton, A. C. Miller, and A. J. McDonnell.
Water Resources Bulletin, Vol 17, No 5, p 760-766, October, 1981. 5 Tab, 3 Ref.

Descriptors: *Waste load, *Water pollution prevention, Planning, Model studies, *Literature review, Water quality control, Regulations, *Streams, *Assimilative capacity, *Design flow.

A survey of the literature and of water resources research institutes produced 20 potential methods for calculating waste load allocations. Five of these were compared, using 25 sets of waste load allocation data. The most promising method in terms of insensitivity to basic water quality data errors was No. 1, equal percent removal or equal percent treatment. Method No. 4, effluent concentration inversely proportional to pollutant mass inflow to treatment facility, was nearly as insensitive. There were disadvantages associated with all 5 models studied in detail. No. 1 forces small volume dischargers and dilute sources to treat wastes to a higher and more expensive degree. No. 4 requires large dischargers to treat to a higher level. Waste load allocations were sensitive to variations in reaeration and deoxygenation rate constants and to pollutant source strengths and locations. (Caesar-FRC)

HYPOLIMNETIC AERATOR FIGHTS EUTROPHICATION,

Water and Pollution Control, Vol 119, No 10, p 24, October, 1981. 1 Fig.

Descriptors: *Lake restoration, *Eutrophication, *Aeration, Water pollution effects, Water pollution control, *Hypolimnion, Nutrients, Water pollution prevention, Water quality control, Lakes, Tertiary wastewater treatment, Population exposure, Population dynamics, *Ontario.

Free floating portable hypolimnetic aerators have been designed by a group of scientists at York University for combating eutrophication in Ontario lakes. The aerator features a riser tube of flexible polyvinyl coated nylon to resist breakage and rubber hoses to receive compressed air from the shore. One aerator can aerate the hypolimnion of a whole lake if operated long enoough. Initial testing of the apparatus has been conducted on Tory Lake and Lake St. George. By 1984, weekly followup testing including tests on the dynamics of lake aquatic species will amount to the largest study of lake aeration to date. The aerator is seen as a short-term solution to lake eutrophication due to nutrient addition from urban and agricultural runoff. The construction of tertiary sewage treatment plants and the use of modified agricultural practices are recommended to solve the problems of lake deterioration in Ontario over the long run. REMOVAL OF HEXAVALENT CHROMIUM FROM ESTUARINE WATERS BY MODEL SUBSTRATES AND NATURAL SEDIMENTS,
Maine Univ. at Orono.
L. M. Mayer, and L. L. Schick.
Environmental Science and Technology, Vol 15, No 12, p 1482-1484, December, 1981. 5 Fig, 14 Ref.

Descriptors: *Chromium, *Sediments, *Adsorption, *Salinity, Fate of pollutants, *Estuaries, Chromates, Metals, Estuarine environment, Phosphates, Silicates, Suspended sediments, Water pollution control.

Chromate was not effectively removed by suspended sediments at concentrations typical of estuarine systems (< 1 g per liter). Removal of hexavalent Cr was studied using two model substrates, alumina and kaolinite, and natural estuarine sediments at salinities of 0 to 32 o/oo and 1 microM Cr per liter as K_2CrO_4. Chromate removal from seawater varied from 0.1 to 0.4 microM per liter at sediment concentrations near 0 mg per liter to about 0.5 micro M per liter at 200 mg per liter. Natural estuarine sediments were more efficient in immobilizing Cr than the model substrates. Cr removal decreased with increasing salinity in alumina and kaolinite experiments over the range 0 to 32 o/oo. Cr removal in natural sediments increased to the 0.1-1.0 o/oo salinity range and decreased with increasing salinity thereafter. The peak is similar to that seen when Cr(6+) is reduced to Cr(3+) by gallic acid at increasing salinity. This suggests a two-step sequence of reduction followed by adsorption (reductive adsorption). Naturally occurring levels of phosphate and silicate had negligible effect on chromate removal. (Cassar-FRC)

GROUNDWATER QUALITY IMPROVEMENT THROUGH NONLINEAR DIFFUSION,
Center for Water Resources Development and Management, Trivandrum (India).
P. Basak, and V. V. N. Murty.
Journal of Hydrology, Vol 53, No 1-2, 151-159, September, 1981. 3 Fig, 10 Ref.

Descriptors: *Mathematical equations, *Water quality management, *Groundwater pollution, *Diffusion coefficient, Mathematical studies, Mathematical models, Water pollution control, Water quality control, Permeability, *Groundwater.

At the present, no formal analytical solution has been offered for the problem of gradual improvement of groundwater quality by diffusing the contaminant to the adjoining less contaminated source. An effort was made to develop an analytical solution to this problem with constant and concentration-dependent diffusivities. When the diffusion coefficient (D) is assumed to be constant, the governing differential equation is linear. When D is assumed to be concentration-dependent, the governing equation becomes nonlinear. Since the difference between the exact solution of the concentration-dependent diffusion and the linearized solution for diffusion is negligible, the use of the simplified linearized solution is recommended for all practical purposes. The nonlinearized solution to the problem of gradual improvement of groundwater quality by diffusing the contaminant should be used when greater accuracy is required. (Geiger-FRC)

AN ECONOMIC APPROACH TO GROUND WATER QUALITY MANAGEMENT,
California Univ., Davis. Dept. of Agricultural Economics.
R. E. Howitt, and P. Mean.
In: Proceedings of the Thirteenth Biennial Conference on Ground Water, Irvine, September, 14-15, 1981. California Water Resources Center, University of California, Davis, Report No 53, November, 1981. p 103-113. 2 Fig, 3 Tab, 4 Ref.

Descriptors: Degradation, *Saline soils, *Crop yield, Aquifers, Percolation, *Economic aspects, Soil types, Salt balance, Leachates, Social costs, Water costs, Perched groundwater, Recharge, Agricultural hydrology, Hydrologic models, Agriculture, *Groundwater management, *Water quality control, Aquifer management.

Groundwater quality degradation, particularly salinity increases, seriously affect costs to agricultural, municipal and industrial users. This paper discusses the economic aspects in the agricultural sector and centers on two themes: (1) that farmers can take actions to offset much of the cost of expected salinity increases over the next 20 years: and (2) that the reactions of farmers to physical and economic changes must be considered when planning salinity reduction projects. Salinity mitigation actions include crop rotation, blending water sources, and using varied irrigation methods. Several factors that will affect farmers' reactions to increased salinity are the long run vs. short run costs and the timing of any remedial action. Salinity buildup is inevitable without remedial action; therefore, optimal economic management of an aquifer requires that both long and short run costs of salinity buildup be equated to remedial costs at any given time. An economic hydrologic model was built at one of two Kern County study sites and the most pertinent result showed that the cost of groundwater salinity degradation increases over time keeping other factors constant. Lag time, or memory, of salts percolating into the aquifer was omitted from the model, but is is generally believed that the time lags of salinity are very long and that the timing of remedies is crucial. The major long run cost of increased salinity is soil permeability rather than the intermediate cost of soil depression. Groundwater salinity is a common pool problem and all users must contribute to the solution. (Atkins-Omniplan)

FLOW-AUGMENTATION AND WATER QUALITY IN PARAIBA DO SUL RIVER BASIN-BRAZIL,
C. Celso do Amaral e Silva.
Water Science and Technology, Vol 13, No 3, p 43-48, 1981. 2 Fig, 2 Ref.

Descriptors: *Water quality control, *Energy loss, *Minimum flow, *Flow augmentation, *River basins, Paraiba River, *Brazil, Model studies, Rivers, Multireservoir networks, Water pollution control, Reservoirs, Mathematical models, Computer models.

The DOSAGM model and the Multi-Reservoir model were applied to the South Paraiba River basin to study pollution control. Minimum flow was maximized at various points in the system. Optimum operation is based on comparisons between the cost necessary for waste treatment and the costs resulting from increases in minimum flow. A graph depicts the system energy loss in percent as a function of the minimum flow (cu meters per sec) at any point. Zero energy loss occurs at a flow of 45 cu meters per sec and 60% at 75 cu meters per sec. (Cassar-FRC)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

WATER SUPPLY RELIABILITY THEORY,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
U. Shamir, and C. D. D. Howard.
Journal of the American Water Works Association, Vol 73, No 7, p 379-384, July, 1981. 15 Fig, 2 Tab, 2 Ref.

Descriptors: *Reliability, *Mathematical analysis, *Water supply, Statistical methods, Maintenance, Water demand, Economic aspects, Water storage, Pumping.

Mathematical functions are used to describe water supply reliability and to develop a framework for its economic assessment. The analysis is based on demand being fixed and known, while future work will have to deal with the random nature of both demand and supply. A comprehensive statistical description of reliability can be developed by defining a reliability factor that is a function of the relative shortfall during a failure or over some period of time. The required data is usually readily available in the maintenance records of water supply companies, as interfailure times and repair durations are the only data needed. Also, a procedure can be developed to determine which expansion alternative provides the desired reliability. This procedure is demonstrated for the alternatives of additional storage versus standby pumping capacity. Reliability can be increased by adding facilities, storage, pumping capacity, and pipelines, and this procedure can be used to identify the least cost combination of facilities. (Small-FRC)

OUTLOOK FOR WATER AND WASTEWATER SYSTEMS, PROCESSES, AND EQUIPMENT: COMMENTS FROM MALCOLM PIRNIE, INC., WHITE PLAINS, NY,
R. F. Bonner.
Water/Engineering and Management, Vol 128, No 3, p 63-64, March, 1981. 1 Fig.

Descriptors: *Wastewater treatment, *Projections, *Energy conservation, Wastewater facilities, Performance evaluation, Equipment, Sludge thickening, Sludge drying, Sludge digestion, Sludge conditioning, Aeration.

As a result of the change in the relationship of the relative costs of labor, chemicals, and energy, in addition to the possible unavailability of energy, energy reduction and savings will be the designer's focal point in choosing and specifying processes, systems, and equipment for wastewater treatment plant construction, whether new, retrofitted, or expanded. This is particularly true in metropolitan areas with large plants. As a result, the sludge handling and disposal processes and the aeration facilities, both of which are major consumers of energy, will be investigated intensively for ways to reduce energy usage. Various processes for thickening, digesting, conditioning, dewatering, and incinerating sludge which provide energy savings are currently under investigation. The addition of

waste heat recovery systems is also being explored. Aeration is the prime power user for the liquid portion of the wastewater treatment system, regardless of the technique selected. Choice of the particular method should be carefully investigated with respect to the type of waste to be treated. (Carroll-FRC)

OUTLOOK FOR WATER AND WASTEWATER SYSTEMS, PROCESSES, AND EQUIPMENT: COMMENTS FROM GILBERT/COMMONWEALTH, READING, PA,

J. E. Germaine.
Water/Engineering and Management, Vol 128, No 3, p 62, 63, 69, March, 1981.

Descriptors: *Wastewater treatment, *Wastewater facilities, *Projections, Management planning, Water treatment, Sludge drying, Energy conservation, Energy, Conservation.

A variety of projections with respect to water and wastewater systems, processes, and equipment are presented. A continued slow demand for wastewater and water treatment equipment and facilities is expected in the near future, followed by a slight increase and leveling off as more wastewater projects move from current planning phases to construction and as increased water demands necessitate expansion of water supplies. Energy conservation considerations can be expected to continue to have a significant impact on capital investment decisions. The Environmental Protection Agency's emphasis on innovative and alternative systems and on consideration of on-lot wastewater disposal as an alternative to wastewater plants will affect equipment and facility selections and decisions in the wastewater treatment field. The use of the rotating biological contactor in the liquid process train of wastewater treatment facilities and of the belt filter press in the sludge train can be expected to increase. Rehabilitation of old water treatment systems will become increasingly urgent in the coming years. Pursuance of the goals of the United Nation's Water Decade should result in a large international market for basic equipment and services, particularly in rural areas. If water and wastewater facilities are to meet future needs, manufacturers will have to reestablish high standards for equipment quality and manufacturer service. (Carroll-FRC)

NUMERICAL SIMULATION OF RESERVOIRS,

Brown Univ., Providence, RI. Div. of Applied Mathematics.
M. C. Michaud.
PhD Thesis, June, 1980. 124 p, Numerous Illust, 10 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-11146.

Descriptors: *Mathematical models, *Mathematical studies, Algorithms, *Fluid mechanics, *Reservoirs, Flow.

The numerical methods presented have been developed for use in problems of fluid mechanics with flows that display shocks, shear layers or steep fronts. An area of particular interest is multiphase flow of oil, water and often other phases in an oil or natural gas reservoir. These reservoirs are discussed including their properties and some of the particulars of water flooding. Numerical methods for reliable simulation of the fluid motion of oil and water in waterflooding of a reservoir are explained and discussed. A simplified saturation equation is used as a model of two-phase flow in a porous medium. The techniques presented are applicable to the kinds of multiphase flows that are important in other secondary and tertiary recovery methods. The basic algorithm used is the biased difference algorithm. It has been modified to take into account the shape of the fractional flow rate equation. With this simple modification, the midpoint method, the results obtained were good for reasonable ranges of diffusion constants. The midpoint method is a first approximation in an iterative scheme which could be further improved for more precise results. The savings in computation and storage gained by using selective grid refinement versus recomputing the problem on a fine grid will be more pronounced in the three-dimensional case. Selective grid refinement is expected to be applicable in a wide variety of problems with shear layers or steep shocks. (Sinha-OEIS)

GENERALIZED STORAGE-YIELD RELATIONSHIPS FOR SURFACE WATER RESERVOIRS ON NORTHEASTERN UNITED STATES' WATERSHEDS,

Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
T. Haktanir.
PhD Thesis, May, 1980. 484 p, 31 Fig, 21 Tab, 66 Ref, 14 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-24450.

Descriptors: *Water supply, *Reservoirs, *Storage reservoirs, *Economic aspects, Model studies, Water Shortage, Watersheds, Urban areas, Economic yield, Water yield, Comparison studies, *Northeastern United States.

Utilizing 500-year-long synthetic data generated from 37-year-long historical data, yield versus storage capacity relationships were determined by a hydrologic model within 95% confidence limits on all the arbitrarily chosen 50 natural streams of various sizes in the study area. This model simulated the operations of an urban water supply reservoir, accounting for streamflows, lake evaporation loss, lake precipitation gain, and loss of storage by sedimentation. Although the statistical model did not account for lake evaporation and precipitation and sedimentation, the results obtained by the statistical formula utilizing the actual 37 years of historical data were observed to be in plausible agreement with those of the hydrologic model at 97.5% probabilities. An economic model, utilizing the empirically derived cost functions for reservoir costs and water shortage costs from the available data in the study area, searched for optimum urban water supply reservoirs by weighing the trade-offs between reservoir costs versus water shortage costs from smaller reservoirs and revealed the quasi-yield versus optimum storage capacity relationships. On the basis of the total costs from the optimum reservoirs at yields between 10 and 100 percent of the average streamflow, a marginal costs analysis showed economically feasible yield levels, which in the study area were found to be between 50 and 70 percent of the average streamflow. Descriptors: *Hydroelectric plants, *Environmental effects, *Feasibility studies, *Slave River, *Alberta, Electric powerplants, Economic aspects, Dam construction, Project planning, Planning, Reservoirs, Lamprey, Mercury, Water resources development.

This paper discusses the principles used in studying the environmental effects of a possible 2000 megawatts development on the Slave River, Alberta. These principles are: (1) environmental considerations should be included from the beginning of project planning and evaluation, (2) environmental consequences can be positive as well as negative, (3) power projects should be evaluated in a systems context, i.e., alternative sites must be included in the planning process, (4) the scale of a project is no indication of its efficiency or environmental impact, and (5) preconceived constraints should not enter into planning at the initial stages. The provisional findings of a feasibility study indicate that the Slave River development is technically feasible and economically attractive. A single stage development is more economical than two smaller developments. Four possible environmental concerns are leakage of the reservoir through karstic formations, spread of the Arctic lamprey upstream, increases in the naturally high mercury levels of Lake Athabasca, and the most environmentally acceptable location for a transmission system. SWMM MODEL AND LEVEL OF DISCRETIZATION,

College of Petroleum and Minerals, Dhahran (Saudi Arabia). Dept. of Civil Engineering.
N. A. Zaghloul.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1535-1545, 1981. 8 Fig, 8 Ref.

Descriptors: *Runoff, *Hydrographs, Simulation, *Model studies, Design criteria, Planning, Catchments, Computers, Flow, Rainfall, Rainfall-runoff relationships, Storms, *Urban areas, *Flow profiles.

The accepted level of discretization used for flow simulation over an urban area was investigated, and the effect of reducing the number of subcatchments on the accuracy of runoff simulation was studied. Methodology is defined to achieve a representative equivalent catchment from theoretical considerations. Verification of the procedures involved a series of applications on both hypothetical and real areas. The simulation results of the simplified (coarse) discretization are compared with those of the detailed (fine) discretization of the same rainfall storms. The accuracy of the simulation is maintained by careful aggregation of the subcatchment parameters and proper selection of the aggregated hydraulic width. It was concluded that surface runoff hydrographs generated from both the detailed subcatchments and the aggregated equivalent catchment will be similar. The weighted average properties of the detailed sewer system will provide an aggregated equivalent transport system. In the proposed simplified simulation using a single catchment and the Runoff Block, the hydraulic width of the single catchment should be reduced to account for the loss in conduit storage by increasing surface storage. The accuracy of the simulation using the Runoff and Transport Blocks and the simplified procedure using only the Runoff Block is maintained by careful aggregation of the subcatchment parameters and proper selection of aggregated hydraulic width. Conduit routing for small areas proved insignificant. The SWMM simulation using coarse discretization will result in reducing setting up and computer costs. (Baker-FRC)

OPTIMIZING SALINITY CONTROL STRATEGIES FOR THE UPPER COLORADO RIVER BASIN,

Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
R. G. Evans.
PhD Thesis, 1981. 314 p, 37 Fig, 14 Tab, 139 Ref, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-19700.

Descriptors: *Water quality control, *Cost benefit analysis, Economic aspects, Salinity, Desalination, Agricultural runoff, Nonpoint pollution sources, Resources development, *Colorado River Basin.

Salinity is the most serious water quality problem in the Clorado River Basin. To offset salinity caused by the development of the vast energy supplies and to allow the seven Colorado River Basin states to fully utilise their allocation of Colorado River water, it is necessary to implement cost-effective salinity control programs in the basin. A simple multi-level nonlinear optimization procedure was utilized to formulate the most cost-effective array of salinity control strategies for the Upper Colorado River Basin. The incremental cost-effectiveness methodology qualitatively indicates the location and general type of alternatives to be implemented in a least cost basin-wide salinity control program. The results also qualitatively indicated the anticipated salt load reduction and expected annual costs of each salinity reduction increase for any preselected level of control. Cost-effectiveness functions were developed for each of the major canals and laterals, the aggregate laterals under each canal, and an array of on-farm improvements for each agricultural project area. Similar functions were also developed for point sources such as Paradox Valley, Glenwood-Dotsero Springs and Crystal Geyser. Collection and desalination of agricultural return flows were also considered. Optimal salinity control programs are presented for the individual alternatives, for individual areas or projects, for the states of Colorado and Utah and the Upper Colorado River Basin. (Sinha-OEIS)

THE DIFFUSION OF TECHNOLOGY IN THE NINETEENTH CENTURY AMERICAN CITY: MUNICIPAL WATER SUPPLY INVESTMENTS,

Northwestern Univ., Evanston, IL.
L. D. Anderson.
PhD Thesis, June, 1980. 241 p, 2 Fig, 28 Tab, 237 Ref, 418 Footnotes. University Microfilms International, Ann Arbor, MI; Order No GAX80-26758.

Descriptors: *Municipal water, *Water supply, *Economic aspects, Investment, History, Social aspects, Benefits, Evaluation, Technology, Nineteenth Century, United States, New England.

The degree of economic rationality with which water supply decisions were made, particularly after 1870, are investigated. The technology of water works construction is examined and improvements in technology which reduced the risk of system failure are described. Changes in cities' perceptions of the potential benefits of water works construction are examined. Better health and less fire damage are the major ones, but the attraction of industry, hopes of future prominence, and municipal pride also motivated water works investments. The role of public health organizations in fostering water works construction is described, as is the effect of increasing medical knowledge about disease. The process by which many small towns obtained water works after 1870 can be described as the diffusion of technology. The general characteristics of diffusion models are discussed, and a limited model is treated with data on the diffusion of water works in New England. Finally, the economic rationality of decisions to construct water works is examined. Social benefits are estimated using fire insurance rate differentials as a measure of expected savings from fire damage. Using these benefits and reported cost of construction, the internal rate of return to water works investments is computed. It is demonstrated that the internal rate of return was substantially higher than the cost of capital, and that the long run advantage of water works over wells is quite large. (Sinha-OEIS)

CURRENT ASSESSMENT OF PROSPECTS FOR FURTHER HYDRO DEVELOPMENT IN CANADA,

Walker (R. L.) and Partners Ltd., Ottawa (Ontario).
J. H. Diddens.
Canadian Water Resources Journal, Vol 6, No 3, p 63-83. 1981.

Descriptors: *Hydroelectric power, *Environmental effects, *Energy sources, Powerplants, *Cost analysis, Electric powerplants, Electric power costs, Costs, *Canada, Water resources development, Nuclear powerplants, Coal, Economic aspects, Planning, Fuel.

Sites for small hydroelectric plants (1 to 10 MW) in Canada are economically attractive only if certain conditions exist, for example, in an isolated location where fuel costs are high. The cost of investment and transmission is currently $10,000 per KW and varies widely according to site cost of alternative fuels, load factors, operating costs, variability of load, and supply requirements. Since the cost of electricity from large system is $1,000 to $3,000 per KW, new small hydroplants cannot generally compete. However, rehabilitation of old systems and pumped storage arrangements may make hydro projects more attractive. Constraining factors include the reluctance of a large power organization to deal with management of a string of small plants, problems with control and technical questions about price, and high engineering and environmental assessment costs. This paper compares the economic aspects and environmental effects of several types of power generation: oil, coal, gas, nuclear, hydroelectric, and innovative technologies. Major factors in the use of alternative power generation methods are the escalating costs, especially of oil; land destruction and acid emissions connected with coal; large reserves and easy transmission of gas; and public concern over long-term effects of nuclear plants. Hydropower, on the scale of thousands of MW, will continue to be the main focus in the Canadian power industry. As the large sites are developed, attention will turn to low head sites with capacities of hundreds of MW. (Caesar-FRC)

ASSESSMENT OF CURRENT AND PROSPECTIVE FOUNDATIONS OF WATER RESOURCES PLANNING,

Nebraska Univ.-Lincoln.
A. H. Chan.
PhD Thesis, May, 1981. 362 p, 26 Fig, 7 Tab, 230 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-24508.

Descriptors: *Water resources development, *Planning, *Economic aspects, Project planning, Cost-benefit analysis, Water supply development, Social aspects, Methodology.

This effort focuses on the philosophic, ideological, and theoretic foundations of water planning. Its intent is to assess the current planning methodology in terms of goal fulfillment. Examination of the current approach uncovers a number of problem areas. First, traditional water planning has been limited to development projects. The process of planning for a project involves locating a suitable site, designing the structure, and evaluating the economic feasibility. The aggregate of these projects constitutes the existing U.S. water resources policy. This approach of planning-by-project suffers from a lack of comprehensiveness, coherence, coordination, and consistency. Secondly, embodied in this approach is a planning methodology which has been benefit-cost analysis as the center piece. Thirdly, benefit-cost analysis focuses exclusively on economic (monetary) values established through the market when evaluating project feasibility. This study demonstrates the inadequacy of the current approach for proper goal achievement. Any competing approach hoping to replace the one presently in use needs to possess certain attributes. They include the ability to generate a definitive statement of social aspirations, to evaluate existing conditions in accordance with established goals, and to accurately account for the system and the process. This study outlines the foundations of a prospective methodology which takes a broad view of planning, incorporating knowledge from a variety of disciplines while taking into consideration various aspects of the society and its culture; it indicates the appropriate stages of an alternative planning process; and provides a framework in an orderly and comprehensible form. THE AGRICULTURAL BENEFITS OF SALINITY CONTROL ON THE RED RIVER OF TEXAS AND OKLAHOMA,

Texas A and M Univ., College Station.
D. H. Laughlin.
PhD Thesis, December, 1980. 292 p, 14 Fig, 38 Tab, 71 Ref, 8 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-08023.

Descriptors: Economic aspects, Cost-benefit analysis, *Economic feasibility, *Agriculture, Irrigation, *Saline water, Chlorides, Computer programs, *Saline water control, Crop production, Texas, Oklahoma, *Red River.

Salinity of the waters from the Red River and its major tributaries has virtually eliminated its use for irrigation of agricultural crops in Texas and Oklahoma. A chloride control project has been proposed whereby the source salt waters will be cap-

tured and diverted to storage facilities. The purpose of this study was to estimate the net direct benefits to agricultural producers attributable to the proposed salinity control project. Further, estimates of project costs, municipal and industrial benefits and benefits from improving the water in Lake Kemp were obtained to complete a benefit-cost analysis. The procedure used to estimate agricultural benefits was to use a FORTRAN program to develop initial tableaus of a recursive linear programming model representing agricultural production in the study area. Alternative scenarios involving profit maximizing behavior on the part of producers, current cropping patterns, and with and without SAR crop yield effects were developed to provide a range of benefit estimates. Benefit-cost analysis indicated that the proposed project was economically feasible under assumptions of all scenarios considered except where current cropping patterns were followed for the entire analysis period. METERING PROBLEMS AND METER MANAGEMENT IN TUNISIA (LES PROBLEMES DU COMPTAGE ET LA GESTION DES COMPTEURS EN TUNISIE),
Societe Nationale d'Eploitation et de Distribution des Eaux (Tunisia).
A. Frih, and M. Benaicha.
Aqua, No 3, p 267-270, 1981. 5 Tab, 6 Ref.

Descriptors: *Water metering, *Utilities, *Water rates, Water distribution, Public utility districts, *Tunisia, Monitoring.

Two types of watermeters are in use in Tunisia: the volumetric and the rate of flow. The SONDEDE (Societe Nationale d'Exploitation et de Distribution des Eaux) supplies 385,000 metered customers with a total of 120 million cu meters yearly. Meter management includes checking on all subscribers to acquire statistics and to ensure correct metering and billing, and reducing waste by means of a progressive price structure. Subscribers are notified if unusually high consumption is registered. All those with meters > 30 mm in diameter and who use > 500 cu meters per quarter are monitored for meter overloads or unusually low readings. The 23 heavy users, accounting for 9.2% of consumption, are subjected to more thorough checks with monthly meter reading and state of the meter inspection. Time intervals for maintenance of 5 year minimum and 10 year maximum were determined by sampling in three large towns. (Cassar-FRC)

PhD Thesis, August, 1980. 275 p, 49 Fig, 23 Tab, 79 Ref, 3 Append. University Microfilm International, Ann Arbor, MI; Order No GAX81-02898.

Descriptors: *Water supply, *Water supply systems, *Water shortage, *Mathematical models, Water distribution, Cost-benefit analysis, Developing countries, Rationing, Water use limitation.

In developing countries, cities commonly experience severe water shortages as a result of demands created by a rapidly growing population. The growth of the population of urban areas is caused by massive migrations from rural to urban areas and high birth rates. Population increases due to migration alone tend to overwhelm the available water supply resulting in water supply systems that are required to operate under 'deficit' conditions. Rather than operating on an intermittent basis, alternative operating strategies and design procedures to mitigate the adverse effects of water deficits associated with different types of distribution systems are examined and evaluated. Mathematical programming techniques were used to evaluate various design alternatives with pumping costs used as a surrogate for the operating costs of water distribution systems. The rate at which water is supplied to the users is the principal determinant of the cost of the system and the least costly systems are those which have the lowest flow rates. Among the various measures of controlling flow, valving systems appear to be the most cost-effective. (Sinha-OEIS)

POTENTIAL IMPACT OF IRRIGATION ON WATER RESOURCES IN THE LITTLE WABASH BASIN OF ILLINOIS,
Illinois Univ. at Urbana-Champaign.
J. W. Eheart, and A. E. Libby.
Water Resources Bulletin, Vol 17, No 5, p 851-856, October, 1981. 5 Fig, 1 Tab, 12 Ref.

Descriptors: *Water demand, *Irrigation effects, Economic aspects, Water supply, *Cost-benefit analysis, Water shortage, Water policy, Prices, Corn, *Little Wabash Basin, *Illinois.

An economic analysis of irrigation demands vs. prices of corn (Zea mays L.) in the Little Wabash basin, Illinois, showed that rising corn prices would make irrigation more profitable to the extent that water shortages would occur. At $3.50 per bushel, no irrigation is predicted. Between $3.50 and $6.50 irrigation is likely for a small region supplied with good quality groundwater. Above $6.50-$7.50 irrigation is profitable in the entire basin using impounded water. Possible shortfalls, where potential water demand exceeds supply, are 2-20% for a price of $3.50-$6.50 and about one-third at prices above $7.50. Although there has been little crop irrigation in the basin to date, it would probably follow the general trend of increasing irrigated acreage in Illinois. These findings suggest that the State of Illinois should begin developing policies for controlling withdrawals of natural waters before large capital investments in irrigation equipment are made. GROUNDWATER QUALITY IN VISAKHAPATNAM BASIN, INDIA,
Andhra Univ., Waltair (India). Dept. of Geophysics.
V. V. J. Sarma, and A. N. Swamy.
Water, Air, and Soil Pollution, Vol 16, No 3, p 317-329, October, 1981. 6 Fig, 3 Tab, 16 Ref.

Descriptors: *Water quality, *Water use, *Visakhapatnam Basin, *India, Groundwater potential, Domestic water, Drinking water, Industrial water, Irrigation water, Saline water, Water hardness, Chemical composition, Developing countries.

The chemical nature of groundwater in the 148 sq km Visakhapatnam Basin, India, was investigated to determine its suitability for domestic, irrigation, and industrial purposes in this rapidly developing region. Almost half the wells produced water which exceeded the World Health Organization recommended upper limits for chloride, sulfate, fluoride, Mg, Ca, and/or total hardness. In some cases pollution from industrial wastes and sewage caused the high mineral levels; in others, saltbearing formations. Most of the well samples ranged from medium to very high salinity and low to very high Na content. Water quality varied considerably from the good water along the foothills to unsuitable water in the plains. As measured by the residual carbonate factor, 51% of the samples were considered safe for irrigation (> 1.25 meq per liter), 12% were marginal, and 37% were unsuitable (< 2.5 meq per liter). Industrial water quality requirements vary considerably, but most of the water is too hard for use as boiler feed water. (Cassar-FRC)

M. Metler.
Effluent and Water Treatment Journal, Vol 21, No 10, p 456-459, October, 1981. 1 Fig, 1 Tab.

Descriptors: *Water management, *Planning, *Poland, Resources management, Water quality, Water treatment, Water requirements, Water use.

While Poland would appear to have adequate water resources, the usable, available resources are considerably less than would be estimated at first glance. Also problematic is the fact that the water is not distributed uniformly, either geographically or seasonally. The non-returnable water consumption for the year 2000 is estimated at 10 billion cubic meters, and it follows that without a significant increase in reservoir capacity, the existing maximum for non-returnable water consumption of 7 billion cubic meters will be exceeded by a substantial margin. The volume of municipal sewage and industrial effluent discharged into Polish rivers continues to increase rapidly, and the present state of treatment is unsatisfactory. Regulations currently in force in Poland divide water quality into three categories according to the intended use. The water quality surveillance system has determined constant deterioration in the quality of water resources during the past 20 years, and it is now considered to have reached an unsatisfactory level. At present the day to day coordination and supervision of water management and environmental protection matters is in the hands of 49 Provincial Presidents and the local authorities for each separate administrative area. This makes the control spread out into too many different hands and leads to confusion and little forward motion. A research program has been undertaken to improve the situation. Specific areas of concern include studies on the influences of pollution on water quality, technological methods of effluent treatment and sludge processing, and criteria and technological solutions leading to the prevention of water pollution. WILL EPA'S NATIONWIDE URBAN RUNOFF STUDY ACHIEVE USEFUL RESULTS,
Colorado State Univ., Fort Collins, Dept. of Civil Engineering.
G. F. Lee, and R. A. Jones.
Civil Engineering (New York), Vol 51, No 9, p 86-87, September, 1981.

Descriptors: *Urban runoff, *Water quality, Runoff, Urban drainage, Storm runoff, Water pollution sources, *Regulations.

About 30 different studies are being conducted in cities across the US in a Nationwide Urban Runoff Program, under the guidance of the EPA. The studies are attempting to determine whether large amounts of money spent in domestic and industrial wastewater treatment will bring about any improvement in receiving water quality due to the high contaminant loads concentrations arising from urban stormwater drainage. The most significant deficiency seen in the current program is the failure of those responsible for developing these studies to properly consider how chemical contaminants cause impairment of beneficial uses of water. Since many chemical contaminants exist in aquatic systems in forms which are not available to affect water quality, the total concentration of a chemical in a water cannot be used as a basis for developing cost-effective, technically valid, environmentally protective programs for its control. The amounts of available forms of chemical contaminants in a water sample cannot in general be determined by direct chemical analysis, but must use bioassay techniques. The fact that bioassays are not required in the National Urban Runoff Program studies is viewed as a serious shortcoming. The water quality standards used for urban stormwater drainage must be directed toward the concentrations of available forms of contaminants rather than the total concentrations, and must allow consideration of the length of time that concentrations of available forms exceed the critical concentrations for any duration of exposure at each site of concern, as well as the impact of those couplings on beneficial uses of the waters in question. Management programs should focus on the control of the sources contributing concentrations of contaminants most likely to directly affect the useable characteristics of the receiving waters. HOME RULE WETLANDS PROTECTION IN MASSACHUSETTS: LOVEQUIST V. CONSERVATION COMMISSION OF THE TOWN OF DENNIS,

K. W. Brown.
Boston College Environmental Affairs Law Review, Vol 9, No 1, p 103-131, 1980/1981. 150 Ref.

Descriptors: *Wetlands, Home rule, *Legislation, *Water law, Permits, *Judicial decisions, Zoning, *Massachusetts, Lovequist vs. Dennis, Road construction, Legal aspects, Construction, Local governments, Jurisdiction, State governments, Governments.

Although several federal statutes concern wetlands protection, responsibility for such regulation is mainly in the state domain. The Massachusetts Wetlands Protection Act of 1972 (WPA), the Zoning Act, and the state earth removal statute give substantial statutory authority over local wetlands to municipalities. All these laws have drawbacks, and municipalities have turned to enacting wetlands regulations under home rule. The Massachusetts Supreme Judicial Court Decision Lovequist v. Conservation Commission of the Town of Dennis said that state laws did not preempt wetlands regulation from home rule enactments. In this case the plaintiffs wanted to build an access road over a marsh to an adjacent upland. The Town of Dennis denied the permit and was challenged in court. There are several differences between the Dennis by-law and the state statutes. The Dennis by-law required a local permit for wetlands alteration in addition to the one required by the Wetlands Protection Act. If the development would affect erosion, wildlife, recreation, or esthetics (not covered in the WPA), the permit could be denied or conditions imposed on the work. The Lovequist decision illustrates a liberal approach to home rule environmental protection which does not jeopardized a state's authority of legislation. (Cassar-FRC)

WATER QUALITY AND THE EEC,

A. K. Galloway.
Water Services, Vol 84, No 1008, p 108-110, February, 1980. 1 Fig.

Descriptors: *Water quality, *International agreements, Planning, Organizations, Administrative agencies, Water resources institutes, Water management, Water quality management, Water quality standards, Water quality criteria, Water pollution prevention.

Ten EEC directives or decisions relating to water quality have been issued, covering discharge of dangerous substances, surface water intended for abstraction for drinking, bathing water, titanium dioxide wastes, freshwater fisheries, methods of sampling and analysis, and underground water. A proposal for an EEC directive must come from the Commission, but a directive may only be adopted by the Council of Ministers. In order to ensure final unanimity at the Council level a good deal of negotiating and discussing on the form and content of the directive is necessary. At this stage national authorities will consult the interests affected by the proposals and each member state will formulate the line which it will take in the discussions. The method used to identify the waters to which a given directive will apply is not always the same for each directive. In some cases the choice of waters affected by the directive is up to the individual member states. If a directive requires that certain conditions be met, for example in the quality of bathing water along the beaches, and the particular countries involved cannot meet the deadline established, there are provisions for obtaining extensions. THE EVOLUTION OF WATER QUALITY MANAGEMENT,

R. D. Hennigan.
Clearwaters, Vol 10, No 1, p 11-12, March, 1980. 4 Ref.

Descriptors: Planning, *Water quality management, Water quality, *Water pollution control, Decision making, Administration, *Regulations.

In 1977 changes were made in the Federal Water Pollution Control Act. The pollutant classification system was changed, with different deadlines and treatment requirements for each class. Construction grants for alternative and innovative technology for municipal waste treatment were increased. Increased control was imposed on sludge disposal. The states were given power to administer the construction grants and permit programs. The needs of rural counties were reemphasized. Farming and forestry activities were exempted from pollutant discharge control. Monies for institution of best management practices (BMP) on farmland were approved. Grant moves for sewer systems were limited. While considerable improvements have been noted in water quality in various areas, some areas lag behind in percentage compliance with the old deadlines of the 1972 Act. Toxic wastes were a major issue, including heavy metals, pesticides, PCBs, and other organic compounds. Advanced wastewater treatment came under fire as unduly expensive and unnecessary. Programming for the long haul is becoming more and more accepted as quick solutions to the water problem continue to fail and unreasonable expectations are ended. An all encompassing statute covering all environmental control will be proposed at some point in an attempt to bring a holistic perspective and integrated program administration to environmental affairs. (Baker-FRC)

COSTEL V. PACIFIC LEGAL FOUNDATION, 100 S. CT. 1095 (1980),

N. Hungerford.
Environmental Law, Vol 11, No 2, p 449-459, Winter, 1981. 67 Ref.

Descriptors: *Permits, *Legal aspects, Industrial wastes, Effluents, Decision making, *Water quality control, Water pollution sources, Legal aspects, Environmental control.

This case provided a look at the Supreme Court's view of the administrative processes by which environmental decisions are made. The narrow issue addressed in the case was whether the Environmental Protection Agency must hold a public hearing prior to extension of a permit issued pursuant to the National Pollutant Discharge Elimination System (NPDES) if it received no requests for such a hearing. The Supreme Court held that no public hearing was necessary. The implication from this decision, that the Court will narrowly construe statutory and regulatory language regarding public participation in administrative decision making including environmental decisions, is unmistakable and far reaching. The uneasy balance between public participation and agency ability to exclude the public is thus illuminated. When the Pacific Legal Foundation was begun, EPA's regulation implementing the FWPCA provided for public notice of a proposed issuance, denial, or modification of a permit. Those regulations then directed the EPA administrator to hold a public hearing on a proposed action if he found a significant degree of public interest. The regulations also allowed any interested person to request an adjudicatory hearing after EPA's decision had been made regarding a proposed action. A hearing request would be granted if it raised material issues of fact relevant to the questions of whether a permit should be issued, denied, or modified. In 1977 the expiration date of the permit issued for pollutants discharged from the giant Hyperion Wastewater Treatment Plant was extended without a hearing. A postdetermination request for an adjudicatory hearing was denied. Two petitions were filed challenging the EPA Administrator's action extending the section of the permit. The court of appeals upheld the petitions, but the decision was reversed in the Supreme Court. (Baker-FRC)

ECONOMICAL USE OF WATER RESOURCES.

Civil Engineer in South Africa, Vol 23, No 2, p 31, February, 1981.

Descriptors: *Water management, *Political constraints, *International agreements, South Africa, Water resources development, Utilities.

An international approach to water resources development and distribution is necessary for efficient management of water among the South African nations. Although interbasin transfers and other cooperative efforts are in practice in this region, these will become more difficult under proposed reorganization into a constellation of states unless an international nonpolitical water utility is established. The existing Rand Water Board is regional and severely constrained. (Cassar-FRC)

ENVIRONMENTAL REGULATION AND CONSTRAINTS UPON SMALL HYDRO DEVELOPMENT IN CALIFORNIA, U.S.A.,

Tudor Engineering Co., San Francisco, CA.
D. S. Graham.
Canadian Water Resources Journal, Vol 6, No 3, p 295-302, 1981. 1 Ref.

Descriptors: *Environmental effects, *Regulations, *Hydroelectric plants, *California, Water rights, Water policy, Water resources development, Stratification, Reservoir, Fish, Dams.

Small hydroelectric development in California is described, with emphasis on environmental concerns and regulations. Such development is encouraged by the government, which has reduced red tape, provided loans, and screened potential sites. However, the problem of water rights is a constraint, especially in the West. In California a developer must follow both federal and state procedures with respect to environmental impact statements. These overlap considerably, so the same information can often be used for both requirements. Particular concerns in California are raptors, archeological sites, and recreation areas. Some other examples of environmental effects of small hydro development are: withdrawal of anoxic hypolimetric water through the turbine and downstream, reservoir stratification and temperature rise, disturbance to aquatic life, fish mortality in turbines, prevention of upstream migration, change of conditions in estuarine nurseries, water level fluctuations, and sediment problems, such as scouring and erosion. WATER QUALITY: WHAT SHOULD BE DONE TODAY,

National Resources Defense Council, Inc., Washington, DC.
J. T. Banks, F. Dubrowski, and J. M. Warren.
February 12, 1981. 90 p, 5 Tab.

Descriptors: *Legislation, *Groundwater pollution, *Non-point pollution sources, *Toxins, Hazardous materials, Federal jurisdiction, Public policy, Public participation, Political aspects, Cost-benefit analysis, Pollution load, Groundwater management.

The National Resources Defense Council (NRDC) sees some water quality cocerns as not only critical but near-term because they arise in the context of existing legislation and agency programs, and are on the agenda for the next year or two. The major issues stressed by the NRDS, in terms of the effectiveness of existing legislation and enforcement programs, are toxic industrial discharges, non-point sources, and groundwater protection. Those who seek ways to improve the Clean Water Act during the process of Congressional reauthorization in 1981 need a high level of sophistication to address complex questions of cost-effectiveness vs. cost-benefit, rule-setting policies of the U.S. Environmental Protection Agency, federal-state jurisdictional questions and related issues of shifting economic and administrative burdens on various levels of government, and the technology-based controls needed for second-generation toxics control. Non-point source discharges have received scant attention from Congress, and legislation is needed that incorporates an adequate data base, a public constituency, and sound policy analysis. EPA's proposed groundwater protection strategy raises several major issues, such as whether the principle of non-degradation of existing groundwater quality should be adopted, at least with respect to currently pristine and drinking water quality aquifers. Another issue is the lack of available information regarding the characteristics of groundwater and the relationships between aquifers, which is necessary before any classifications can be made. Meanwhile, a coordinated program of interim measures to reduce further contamination is urgently needed. (Garrison-Omniplan)

CLEAN WATER ACT.

Natural Resources Lawyer, Vol 14, No 2, p 261-303, 1981. 320 Ref.

Descriptors: *Water quality, *Legal aspects, *Federal jurisdiction, Reviews, Legislation, Standards, Jurisdiction, Permits, Regulations, Clean Water Act.

Developments in the field of water quality control are reviewed for the period of 1980. The review is divided into three parts: judicial and administrative developments under the Clean Water Act (CWA), judicial administrative and legislative developments under the Safe Drinking Water Act, and judicial developments in the area of private rights of action and the federal common law of nuisance. Under the CWA, judicial activity was highlighted by four unanimous Supreme Court reversals of lower court decisions which had disagreed with the EPA's interpretation of the act. A direct challenge to industrial effluent limitations guidelines was made for the seafood processing industry. The EPA's fundamentally different factors variance clause for best practicable technology (BPT) has proven to be a source of litigation. The dissolved oxygen concentration level needed to support the fishable-swimmable use classification in Mississippi waters was also problematic. Additional activity revolved around the antidegradation policy as part of the states' water quality standards and management plans, new source performance standards, discharges of oil and hazardous substances, the hearing requirements of the NPDES permit program, the dredge and fill permit program, definition of point source, Ohio water quality standards, water quality criteria, toxic pollutant listings, enforcement, and ocean discharge criteria. (Baker-FRC)
W82-03687

CLEAN WATER ACT.

Natural Resources Lawyer, Vol 13, No 1, p 231-286, 1980. 397 Ref.

Descriptors: *Legal aspects, *Water quality standards, *Regulations, Permits, Legislation, Water pollution control, Clean Water Act, Safe Drinking Water Act, Water law, Water policy.

A review of legal aspects of water quality focuses on judicial and administrative developments concerned with the Clean Water Act, the Safe Drinking Water Act, and judicial developments in two areas: definition of navigable waters and availability of relief under the federal common law of nuisance. No substantive changes to major federal statutes took place during 1979. Circuit court decisions regarding the Clean Water Act's effluent guidelines and standards showed deference to EPA technical judgements in areas of scientific uncertainity, but contained disagreements with EPA over the need to consider economic benefits and limitations. In 1979 two cases in Oregon illustrated that EPA is making efforts to enforce the Safe Drinking Water Act against small private suppliers of drinking water. Litigation aimed at defining the term 'navigable waters' as used in the Clean Water Act is generally decreasing. The courts continue to use the broadest possible definitions. (Cassar-FRC)

NEW LEGISLATION IN CALIFORNIA AND ITS EFFECTS,

A. Littleworth.
In: Proceedings of the Thirteenth Biennial Conference on Ground Water, Irvine, September 14-15, 1981. California Water Resources Center, University of California, Davis, Report No 53, November, 1981. p 46-52.

Descriptors: *Legislation, *Water law, *Groundwater management, Judicial decisions, State jurisdiction, Adjudication procedure, Groundwater availability, Groundwater depletion, Groundwater storage, Permits, Prescriptive rights, Overlying proprietor, Appropriation, Pumpage, *California.

Californians are pumping groundwater faster that it can be replenished by natural or artificial recharge. In some areas the overdraft is nearly 20 percent of the total groundwater supply. Currently, California has no statutory provisions to prevent or correct overdrafts. In 1977, the Commission to Review California Water Rights Law was formed and made recommendations in three general areas of groundwater law: establishment of groundwater authority; simplified judicial procedures for basin adjudications; and groundwater authority; simplified judicial procedures for basin adjudications; and groundwater storage management. The recommendations for underground storage were generally accepted; however, the other two recommendations were seen as rationing proposals and were opposed. Various bills were introduced to codify the Commission's proposals but, with few exceptions, all of them failed. SB 95, introduced in 1981, illustrates what happened to a relatively modest proposal with essentially non-controversial reforms. It was opposed by local farming groups who feared state and judicial interference with unnecessary limitations and adjudications. The final version only provided for hazardous waste facilities after all groundwater provisions were amended out. As a result, groundwater law continues to be essentially controlled by the courts or regulated by agreements among contracting parties. The fate of SB 200 will also affect California's future. If it fails, there will be much higher energy costs for increased pump lifts and the competition for insufficient water supply will be greatly intensified. If it passes, groundwater storage will be an integral part of any development program, and could form the nucleus for more comprehensive water management. (Atkins-Omniplan)
W82-03731

SB 1391–TOWARDS A PERMIT SYSTEM FOR GROUND WATER. TOWARDS A NEW DEFINITION OF OWNERSHIP OF GROUND WATER,

G. G. Fry.
In: Proceedings of the Thirteenth Biennial Conference on Ground Water, Irvine, September 14-15, 1981. California Water Resources Center, University of California, Davis, Report No 53, November, 1981. p 12-32. 1 Append.

Descriptors: *Groundwater management, Groundwater, Water districts, *Pumpage, *Water permits, Water supply, *Water law, Legislation, Equitable apportionment, Groundwater basins, Groundwater availability, Overdraft, Aquifers, *California.

The Sierra Valley Groundwater Basin Act–SB 1391–came into being as a result of local fears that both the Sierra and Long Valleys in the Sierra Nevada mountains were being overdrafted. Excluding SB 1391, there are three broad groups to control overdraft: replenishment programs, where water is spread over the ground to artificially recharge the aquifers; in lieu programs, which pay pumpers to use an alternate to groundwater; and pump taxes, which discourage pumping. However, no authority exists that permits a district to require

pumpers to pump less. SB 1391 is unique in that it grants the management districts the authority to limit pumping and the authority to ban export under limited circumstances. During an overdraft or a time of severe water quality problems, the district can implement a permit system for groundwater management. The permit can only be instituted during a time of threatened or actual overdraft and can only be exercised by a board of directors comprised of area residents. This act also attempts to clarify the definition of overlying rights. To provide some predictability to the rights of an overlying user, the extent of ownership was redefined. It is now based primarily on the number of acres overlying the basin that a user owns, in proportion to the total number of acres overlying the basin; a figure that can be adjusted for several factors. A plan such as this has never been set forth in California before and one benefit may be to make it easier to sell groundwater between private parties. This bill is innovative and it will be some time before a discernable track record is established. The appendix contains the text of the bill. (Atkins-Omniplan)
W82-03736

THE FIFTH AMENDMENT PRIVILEGE AGAINST SELF-INCRIMINATION AND COMPULSORY SELF-DISCLOSURE UNDER THE CLEAN AIR AND CLEAN WATER ACTS,
O. A. Caginalp.
Boston College Environmental Affairs Law Review, Vol 9, No 2, p 359-395, 1981. 244 Ref.

Descriptors: *Legal aspects, *Water pollution control, Legislation, Regulations, Self-incrimination, Federal jurisdiction.

Portions of the Clean Water and Clear Air Acts require that much information regarding the pollution come as a result of self-disclosure by those doing the pollution. In both of these Acts there are statements that the information gained through self-disclosure may then be used against the alleged polluter by the government in order to identify violators and exact penalties. Questions are thus raised with respect to the applicability of the Fifth Amendment provisions concerning self-incrimination. This article describes the section of the Clean Water Act dealing with oil and hazardous substance discharges; discusses the specific case of United States v. Ward, emphasizing the factors examined by the Supreme Court in its determination of the character of the penalty provision of section 311(b); and offers a comparison of the Clean Water Act effluent limitation sections. Since the Fifth Amendment protects any one who offers evidence against prosecution only on criminal charges and not on civil charges, great significance is attached to determining whether a penalty for polluting is judged to be criminal or civil in nature. In US v. Ward, the Court first acted to determine whether Congress indicated an intention to establish a civil or a criminal penalty, and second, where Congress has indicated a civil penalty, whether the sanction was so punitive as to negate that intention. It is felt that the Ward reasoning should not be limited solely to environmental legislation, but will probably be adopted in other areas as well. (Baker-FRC)

GLOBAL FUTURE: TIME TO ACT. REPORT TO THE PRESIDENT ON GLOBAL RESOURCES, ENVIRONMENT AND POPULATION.
Council on Environmental Quality, Washington, DC.
Boston College Environmental Affairs Law Review, Vol 9, No 2, p 261-283, 1981.

Descriptors: *Water supply, *Resources management, *International agreements, International commissions, Organization, Administrative decisions, Administrative agencies, Policy making, Decision making, Legislation.

Demands on the world's water supply will increase steadily over the next twenty years. Especially in the Third World, severe water shortages and drought are already being felt, along with waterborne diseases. Reliable water supplies will be increasingly disrupted due to damage to watersheds, and contamination will probably increase. US development assistance efforts will be undercut, and the need for drought relief will increase. With 148 of the world's major river basins shared by two or more countries, increased conflict over water rights and usage should be expected. One major US goal is to heighten awareness of water management issues. This goal requires the development of an adequate worldwide data base, not currently available, and subsequently a coherent strategy on world water needs by region. The US contribution to solving world water problems should make use of its strengths in data collection and monitoring, pollution control, environmental assessment of water resource development projects, nonstructural alternatives to such projects, and water conservation. Bilateral technical assistance in water resource management by the US should be increased, including financial support of the United Nations for training in water management. Research efforts, international agreements, and conflict resolution arrangements should be forthcoming if the problems in water supply and demand are to be resolved. (Baker-FRC)

6F. Nonstructural Alternatives

BEHAVIOURAL AND POLITICAL ASPECTS OF WATER DEVELOPMENT AND IRRIGATION PROJECTS,
International Fund for Agricultural Development, Rome (Italy).
A. A. El-Sherbini.
Water Supply and Management, Vol 5, No 4/5, p 307-316, 1981. 15 Ref.

Descriptors: *Water resources development, *Planning, Social impact, Social aspects, *Political aspects, Social values, Decision making, Design criteria, Behavior, Attitudes, *Irrigation programs, Motivation.

Investment in water development and irrigation projects commands a key role in the plans of most developing countries. In many cases the emphasis has largely centered on the engineering and economic aspects of such projects. Serious neglect has occurred in the areas of behavioral and political outcomes. The continuous failure to take notice of the numerous and very real links between the socio-political structures and project behavior is an indication of a grave omission in an area crucial to project performance and success. Technical change in many cases can come about only if it is accompanied by socio-cultural transformations. Planners and policy makers frequently commit themselves to technical innovations without giving enough thought to the extent to which this commitment entrains additional changes in behavior. Behavioral and political scientists should be involved in the various phases of water projects from the identification of the problem to the implementation of the solution. The monitoring and evaluation of water development and irrigation projects should also pay special attention to these behavioral and political aspects so that problems of these natures can be rapidly detected and timely solutions found. COMMENTS ON A NATIONAL GROUNDWATER PROTECTION STRATEGY,
D. H. Howells.
Ground Water, Vol 19, No 5, p 466-468, September/October, 1981.

Descriptors: *Groundwater management, *Federal jurisdiction, Governmental interrelations, Political aspects, Water management, Legal aspects, Regulations, Standards, Resources, *Water quality control.

Exception is taken to the proposed EPA groundwater protection strategy, especially the goals of the program and the adoption of classification as the principal means of implementing a groundwater protection strategy. Planning is essential, but there is no adequate way to predict the needs of the distant future. Plans must therefore be flexible and adaptable, and their consequences must not be irreversible. Decisions affecting groundwater quality are not so readily reversible as those for surface waters. Classification of water for a specific use does not assure the specified water quality. While classification of surface waters for multiple uses is conceptually sound, it becomes less so with the adoption of such goals as fishing and swimming for all the waters in the nation. The time required for upgrading groundwater sources is too long to be considered achievable. Groundwater systems are vastly more complex than surface water systems. A reasonable strategy should include delineation of important recharge areas and the prohibition of any hazardous waste activities that might threaten the quality of related aquifers. There are also institutional aspects of implementing a national groundwater protection strategy which may prove difficult. (Baker-FRC)

6G. Ecologic Impact Of Water Development

STRANGLEHOLD ON THE SKAGIT,
J. W. Miller.
National Parks, Vol 54, No 4, p 16-19, April, 1980. 2 Fig.

Descriptors: *Electric power industry, *Environmental effects, Dams, *Skagit River, Forecasting, Wildlife habitats, Recreation, Rivers, National parks, *Seattle, Washington, Water policy, Legal aspects.

Proposed power development by the City of Seattle on the Skagit River and its tributaries in Washington and British Columbia threaten wildlife habitats and recreation in this scenic glacial river valley, which lies between two sections of the North Cascades National Park. Several dams were built in the valley, starting early in the century when the public was not concerned with conservation. Present plans include raising the height of the Ross Dam an additional 122.5 feet, the Thunder Creek diversion project, and a dam at Copper Creek. These projects would flood miles of river valley, destroy whitewater streams used for commercial raft trips, divert Thunder Creek into a tunnel, eliminate scenic trails, and adversely affect a variety of flora and fauna, particularly the harlequin duck, bald eagle, salmon, steelhead, river otter, a grove of giant western red cedar trees, a disjunct population of the red rhododendron, and the most northwestern stand of giant ponderosa pine on the continent. A legal decision was expected in mid-1980. (Cassar-FRC)

The Ontario Environmental Assessment Act will play a major role in resolving conflicts between increased demand for hydroelectric power production and the environment. The provincial government has called for an additional 2,000 megawatts of hydropower by 1995. Sixteen plants are under consideration, some new and some retrofitted. Ontario Hydro, municipalities, and private projects as included by Order of Cabinet must obtain a water power lease. Environmental impacts will be considered with technology and money by a three-member assessment board. A proper balance between unchecked development and turning every river into a provincial park will be reached. (Cassar-FRC)

PEACE RIVER SITE C PROJECT: ENVIRONMENTAL STUDIES; DEVELOPMENT OF A MITIGATION AND COMPENSATION PROGRAM; AND PROJECT LICENSING,
J. Waite, and H. Gruber.
Canadian Water Resources Journal, Vol 6, No 3, p 20-37, 1981. 4 Tab, 6 Ref.

Descriptors: *Hydroelectric plants, *Environmental effects, *Social impact, *Peace River, *British Columbia, Cost-benefit analysis, Compensation, Recreation, Agriculture, Planning, Wildlife, Forests, Economic impact, Water resources development, Licensing, Canada.

Possible environmental and socioeconomic effects of the proposed Peace River Site C hydroelectric project in British Columbia are: removal of 12% of agricultural land, loss of residences or outbuildings by over 60 families, change from river-based recreation to reservoir-based activity, significant losses of wildlife on the local scale, increase in most fish populations (except rainbow trout), disturbance of many of the 310 known historical sites, insignificant losses of saleable timber, and increase in social problems at Fort St. John. Principles for mitigation of and compensation for project impacts are presented. These are: (1) payments must bear a reasonable relationship to the value of the resources affected, (2) mitigation expenditures will be made if benefits exceed the costs, (3) compensation payments would be made only if local regions would suffer disproportionately to the rest of the province, (4) funding will be made to the agencies directly responsible for the resources affected, (5) funds for community service impact will be based on social costs imposed by development. An Energy Project Review Process has been established to coordinate a review of environmental and technical aspects. (Cassar-FRC)

THREE CASE STUDIES OF SMALL SCALE HYDRO IN NEWFOUNDLAND AND LABRADOR,
Newfoundland and Labrador Hydro, St. John's.
B. W. Bursey.
Canadian Water Resources Journal, Vol 6, No 3, p 163-177, 1981. 1 Fig 3 Tab, 9 Ref.

Descriptors: *Hydroelectric plants, *Environmental effects, Water resources development, *Newfoundland, *Labrador, Canada, Environmental Assessment Act, Fisheries, Recreation, Forests, Salmon, Wildlife, Water resources development, Case studies.

Case studies of three small scale hydroelectric plants in Newfoundland and Labrador are presented, with emphasis on environmental concerns. These plants are designed to replace oil-based generators in areas remote from accessible fuel supplies. The Roddickton Project in Newfoundland incorporated water quality sampling, a survey to determine possible effects on Atlantic salmon upstream migration, use of untreated wood to protect a downstream municipal water supply, and stream flow regulation to protect fish habitats. At the Pinware River plant in Labrador $800,000 was spent over three years to study possible impacts on fisheries, wildlife, archeological sites, forests, a provincial recreational park, and socioeconomic aspects. The probable costs of mitigating these impacts caused indefinite postponement of this project. The Dry Pond Brook project was expected to have major impacts on fisheries and wildlife and minor impacts on recreation, historic resources, aggregate resources, and socioeconomics. Three conclusions were drawn, based on the experiences gained from these studies. Small-scale hydro projects have all the elements of larger scale projects with respect to environmental concerns. Impacts are site specific. Costs of environmental surveys are proportionately larger than in large scale projects. (Cassar-FRC)

ON HYDROLOGICAL DATA NEEDS IN CANADA,
British Columbia Univ., Vancouver.
M. Church, and M. Kellerhals.
Canadian Water Resources Journal, Vol 6, No 2, p 109-132, 1980. 4 Fig, 1 Tab, 31 Ref.

Descriptors: *Hydrological data collections, *Water management, Decision making, Planning, *Canada.

Concern is expressed that the data available for making decisions regarding management of Canadian water resources is not sufficient for the need. The range of information readily available in the national hydrological data base should be developed considerably. Conventional records of levels, flows, and water quality should be extended both geographically and temporally. How this is to be achieved offers considerable thought. Three substantial innovations are offered. First, analyses of hydrological data should be considerably extended and convenient means should be developed for presenting the results. Second, field procedures should be substantially modified to permit more efficient collection of data of several types, and to take advantage of technical advances in measurement. Third, the types of data collected should be expanded to include information on ice regime, river morphology and biophysical processes. Two direct benefits would accrue from these changes. First, a range of hydrobiological analyses would become available in standard form. Second, the assembly of data on river morphology and history and on biophysical processes would permit better decisions to be made about complex aspects of river management that are not easily reducible to terms involving only actual or desirable flow magnitudes. (Baker-FRC)

7B. Data Acquisition

SEASONAL VARIATION IN HETEROTROPHIC ACTIVITY AND POPULATION DENSITY OF PLANKTONIC BACTERIA IN A CLEAN RIVER,
Hull Univ. (England). Dept. of Plant Pathology.
R. Goulder.
Journal of Ecology, Vol 68, No 2, p 349-363, July, 1980. 7 Fig, 2 Tab, 36 Ref.

Descriptors: *Bacteria, *Seasonal variation, *Population density, Rivers, *Hull River, *England, *Heterotrophic bacteria, Allochtonous bacteria, Plankton.

Heterotrophic activity (as indicated by glucose mineralization), density of total bacteria, mean activity of individual bacteria, and density of viable bacteria were measured in the unpolluted River Hull, England, at 2-week intervals from January 1975 to December 1976. Heterotrophic activity was highest in summer. This can be explained by the high density of total bacteria and by high activity of individual bacteria. Low heterotrophic activity in winter was a result of low density and low activity of individual bacteria. Densities of total bacteria, obtained by direct counting, were 0.34-2.91 million per ml at Wansfor Bridge (fast-flowing water) and 0.32-4.38 million per ml at Bethell's Bridge (slowly-flowing water) and were roughly coincident with the heterotrophic activity values. A combination of high temperature and low river discharge produced the high densities of total bacteria found in summer, and high temperatures produced the high summer activity of individual bacteria. Since density of total bacteria and discharge or rainfall were not positively correlated, allochthonous bacteria were not important. The density of viable bacteria was very variable and showed no seasonal pattern. (Cassar-FRC)

INADEQUACIES IN THE TECHNIQUE OF RESISTIVITY METHOD FOR LOCATION OF WATERWELL SITES IN HARD ROCK AREAS,
Center for Water Resources, Madras (India).
P. N. Ballukraya, R. Sakthivadivel, and R. Baratan.

Descriptors: *Resistivity, *Exploration, *Groundwater availability, *India, Electrical studies, Water yield, Well yield, Wells, Rock testing, Water resources development, Drilling, Geohydrology, Granite, Gneiss.

The electrical resistivity method for locating groundwater has been inadequate in the hard rock region of south India. Water in this granite and gneiss bedrock is in two types of zones: decomposed rock and joints and fractures. Vertical sounding curves obtained at 17 sites near Bangalore, India, were matched against theoretical model curves and analyzed by the inverse slope method. The results did not agree well with actual driller's logs. There were no satisfactory correlations between the resistivity values and water yield. Thickness of overburden was usually underestimated by the resistivity measurements. (Cassar-FRC)

A PORTABLE APPARATUS FOR THE MEASUREMENT OF RATE OF FLOW BY THE LITHIUM-TRACER METHOD,
Yorkshire Water Authority (England).
T. T. Rimmer.
Water Pollution Control, Vol 80, No 3, p 411-412, 1981. 1 Fig, 1 Tab, 1 Ref.

Descriptors: *Measuring instruments, *Flow measurement, *Tracers, Flow, Flow rates, Lithium, Rivers, Water treatment facilities.

An apparatus is described that was designed to contain and supply a predetermined, constant flow of lithium chloride solution. This apparatus is completely portable, needing no outside power source. The lithium chloride solution is contained within a 25 liter plastic aspirator which is pressurized by a foot-operated air pump. The outlet at the base is connected to an automated flow-control device which gives a constant pressure at the outlet. The discharge of solution is controlled and monitored by means of a rotameter. The Flowset is designed to work at low pressures of 50-150 mm Hg, but the discharge is difficult to monitor if the pressure exceeds this level. The scale on the gapmeter is calibrated from 50 to 800 ml/min of water at 20 degrees C. The flow rate must be measured accurately on site on each occasion to ensure that errors due to solution viscosity/temperature are not introduced. A practical example is given of this apparatus, used to check the flow recorded at a sewage treatment plant. (Baker-FRC)

AN EVALUATION OF THE SEDIGRAPH AS A STANDARD METHOD OF SEDIMENT PARTICLE SIZE ANALYSIS,

Hydrological Research Inst. Pretoria (South Africa).
A. V. B. Weaver, and D. C. Grobler.
Water SA, Vol 7, No 2, p 79-87, April, 1981. 7 Fig, 3 Tab, 19 Ref.

Descriptors: *Particle size, *Sediments, *Measuring instruments, Sedimentology, Performance evaluation, Reproducibility, Hydrology.

Various tests were performed to evaluate the applicability of the sedigraph as a standard instrument for particle size distribution analysis. The effects of varying concentrations, and the effects of cell size, reproducibility and accuracy were investigated. Using the sedigraph reduced measurement time considerably, and it gave results with good repetition. Also, it produced results in close agreement with standard samples. There were discrepancies in the results obtained with the sedigraph, pipette, hydrometer, and sedimentation balance methods, but microscopic analysis of the samples tended to support the results obtained with the sedigraph. The sedigraph is suggested as the standard tool for the measurement of sediment particle size distribution. Sediment particle size is an extremely important measurement in many areas of hydrological research. (Small-FRC)

PARTICLE COUNTER FOR SEDIMENT TRANSPORT STUDIES,

Washington Univ., Seattle. Dept. of Oceanography.
J. P. Downing, Jr.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1455-1465, November, 1981. 7 Fig, 1 Tab, 10 Ref.

Descriptors: *Measuring instruments, *Sediment transport, Bottom sediments, Sand, Acoustics, Electrochemistry, Particle size, Particle shape, Particle counters, *Bed load.

This paper reports the development of an acoustic instrument that measures bed load transport by responding to the direct impacts of sand-sized sediment particles entrained in the bed load layer. The instrument consists of an electromechanical transducer for the detection of particle impacts and an electronic circuit that shapes the transient signals produced by impacts into digital pulses and counts them. The transducer is rugged and physically small, and preliminary field evaluations indicate that the instrument is potentially useful for measuring bed load transport rates in natural flows. By virtue of the principle of particle detection, spurious response of the sensor to silt, clay, biological material, and air bubbles is negligible. The instrument may have application to the problem of local bed load measurement in natural transport systems. Due to the difficulties resulting from the dependence of the instrument output on grain momentum, the best results will be obtained in natural systems with well sorted bed material in the size range from .00975 to .078 inches, with grain velocities exceeding 0.60 meters/second and high transport rates. Other applications include laboratory studies of sediment transport in pipes and flumes and investigations of wind blown sand. The output of the instrument can be transmitted in digital form with only minor modifications to the electronics. In this way, the count-rate values would be recorded directly and more efficient processing of laboratory and field data would be possible. (Baker-FRC)

USE OF VISIBLE AND THERMAL SATELLITE DATA TO MONITOR AN INTERMITTENTLY FLOODING MARSHLAND,

Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research.
G. F. Byrne, K. Dabrowska-Zielinska, and G. N. Goddrick.
Remote Sensing of Environment, Vol 11, No 5, p 393-399, November, 1981. 4 Fig, 1 Tab, 5 Ref.

Descriptors: *Marshes, *Remote sensing, Monitoring, *Satellite technology, *Australia, Flood control, Water level, Flood profiles, Soil water, Soil-water-plant relationships.

Selected thermal and visible data from the Heat Capacity Mapping Mission satellite for the Macquarie Marshes of Eastern Central Australia were examined in the light of a substantial volume of data from other sources, including Landsat, with a view to evaluating meteorological satellite data as ecological monitors for this landform. It is apparent that at least four dominant components of the marshland scene can be mapped using HCMM imagery. These include free water - high thermal admittance, poor coupling for heat transfer to the atmosphere; woodland - low thermal admittance, good coupling to the atmosphere; soil or grass covered soil - lower thermal admittance, poor coupling to the atmosphere; and scald - low thermal admittance, poor coupling, and low soil water content, because of infiltration rate. The ecological status of such scenes is intimately linked with their water status, and a consideration of visible and thermal imagery with appropriate spatial resolution appears to be an economical and effective means of monitoring such systems. Such imagery would, in the long term, provide insight into changes occurring from week to week, insight which could be acquired by ground parties only with great difficulty. The work of a single ground party would be considerably more effective if carried out with a background knowledge of the current status of various components of the system. (Baker-FRC)

THE NEW ENERGY BOOM: SMALL-SCALE HYDROPOWER,

A. Seitz-Petrash.
Civil Engineering (New York), Vol 50, No 4, p 66-71, April, 1980. 2 Fig.

Descriptors: *Hydroelectric power, *Electric power production, *Dams, Regulations, Construction, Financing, Utilities.

Retrofitting older, small dams to produce hydropower is feasible in about 10% of the nation's 50,000 dams. Although there are drawbacks (small size, typically 5 MW, drop in production in low flow and ice conditions, and high cost of custom made equipment), there also are advantages. Hydropower is renewable and clean, has well-understood technology, has a short time from inception to production (1-5 years), operates with few personnel, and has little environmental impact. In Phase 1 of a Department of Energy program, 7 pilot studies and 22 construction projects were begun in 1978. Phase 2 involves funding to encourage municipalities and private developers to become involved in small-scale hydropower. Several New England manufacturers have redeveloped existing low capacity hydropower on their sites for internal use. Some utilities such as Niagara Mohawk, New York, have begun developing hydropower. Hydropower redevelopment will most likely continue to grow. However, it will probably only contribute between 5 and 17% of the nation's total electrical needs. In certain areas it can be a significant power source, especially for manufacturers. Present hydropower costs per installed kW capacity are $300-$2000. (Caesar-FRC)

PUMPED-STORAGE FOR SWISS RAILWAYS, PART ONE,

Swiss Federal Railways, Bern.
P. Rochat, and J-L. Mottier.
International Water Power and Dam Construction, Vol 32, No 2, p 54-59, February, 1980. 5 Fig, 2 Tab.

Descriptors: *Pumped storage, *Railroads, *Water supply, Storage, Dam construction, Reservoirs, *Switzerland.

A pumped-storage system was added to the independent hydroelectrical supply system for the Swiss railroads. At the Chatelard-Barberine plant, a compensating basin with an active storage volume of about 200,000 cu m was constructed. The new station consists of two vertical-axis units with Pelton turbines and generator motors with an overall rating of 80 MVA. There is room for two storage pumps, but only one, with a discharge of 4 cu m/sec and a capacity of 31 MW, was installed. Construction of the Chatelard-Village compensating basin added an artificial reservoir with active storage capacity of 203,000 cu m and a total volume of about 250,000 cu m. The dams which form the basin have a maximum height of 35 m above the foundation level and consist of granitic and gneissic rock. Construction of the dam included several geotechnical tests, and compaction during construction was checked by determining the in-place density using the sand-cone and nuclear methods. The settlement of the foundation under the main dam was recorded using a Telemac settlement gauge with a vibrating wire and an instrument of the communicating-tube type. Eight benchmarks were surveyed to study deformations in the dam after filling of the basin. (Small-FRC)

GROUND WATER MONITORING: PART II,

T. Gass.
Water Well Journal, Vol 35, No 5, p 38-40, May, 1981. 5 Fig, 2 Ref.

Descriptors: *Monitoring, *Groundwater, Water supply development, Water resources development, Groundwater management, Groundwater pollution, Wells, *Well design criteria.

Critical design components of a monitoring well are examined, especially as it relates to well design and methods of extracting a sample. The characteristics of a given aquifer have a part to play in the design of the monitoring well system. The spacing, depth and even the drilling and installation methods used for the wells are to some extent determined by the characteristics of the aquifer. Types of monitoring wells include wells with intakes through a single vertical interval, piezometers and observation wells, well clusters, and single well-multiple sample points. Wells screened over a single vertical interval of an aquifer are one of the most commonly designed and constructed wells for obtaining water samples from unconsolidated or semiconsolidated formations. The major drawback in using individual wells or piezometers screened over a single vertical interval of an aquifer is that they provide no information pertaining to the vertical distribution of the contaminant and only rudimentary information on its areal distribution. Use of well clusters to define the vertical distribution of a contaminant is one alternative. Use of single wells with multiple sampling points will also yield excellent information on the vertical distribution of a contaminant, but only when the sampling zones are carefully sealed from one another within the well and the annular space. EASTERN SCHELDT DESIGN HAS CHANGED.

Civil Engineering (London), p 47, October, 1981.

Descriptors: *Storm surges, *Barriers, *Environmental effects, *Fisheries, Storm tides, Eastern Scheldt, *Netherlands.

In order to protect the environment and fisheries in the area, the design of the storm surge barrier on Holland's Eastern Scheldt was changed. The original design called for closing the area off from the sea. The present design includes sliding gates in three tidal inlets which will be closed only during bad weather. The project is a large one consisting of 66 concrete piers 35 to 45 m high, each weighing about 17,500 tons. Problems experienced during the project included the necessity of compacting the seabed so it can support the pier footings and establishing pier footings. Pier footings will be embedded in dumped rock to resist the strong currents in the area. Six Dutch construction firms are working on the project, which began construction in 1979. (Small-FRC)

USE OF COMBINED CYCLIC-CONTINUOUS TECHNOLOGY IN EARTH-DAM CONSTRUCTION,

A. I. Churakov.
Hydrotechnical Construction, No 1 p 12-18, January, 1980. 6 Fig, 5 Tab, 4 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 1, p 8-12, January, 1980.

Descriptors: *Conveyance structures, *Dam construction, *Rock excavation, Excavation, *Earth dams, Rockfill dams, Quarries.

The most common transport system for constructing earth dams combines trucks with conveyor belts in a 3-phase set-up. Motor vehicles transport quarry material to a storage hopper, a conveyor belt moves it to a hopper located at the dam, and trucks carry the fill to the dump site. Greatest efficiency is reached at a freight turnover of 3000-6000 tons per hour and a haul distance of 4.5-5.0 km. If large rocks exceed 3% of the total mass, conveyor output changes. Supplementary crushing is carried out when 20-25% of the material is too large for transport (400 mm). An example of rock transport for a mining enrichment plant is given. When the conveyor system approaches design capacity, considerable savings are realized. (Casear-FRC)

HYDRODYNAMIC EFFECTS IN DYNAMIC RESPONSE OF ARCH DAMS,

California Univ., Berkeley.
C. S. Porter.
PhD Thesis, December, 1980. 331 p, 43 Fig, 2 Tab, 27 Ref, 9 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-13167.

Descriptors: *Hydrodynamics, *Arch dams, *Mathematical models, Structural behavior, Earthquakes, Concrete dams, Water resources development, Design criteria, Dynamic response, Ground motions, Impounded water.

The objective of this work was to study the dynamic structural behavior and response of arch dams to ground motion, with special emphasis on identifying hydrodynamic effects in the response behavior. The substructure method has been adapted and generalized for response analysis of arch dams subjected to upstream-downstream, cross-stream and vertical components of ground motion. The arch dam and impounded water are treated as two substructures of the total system and displacements of the dam are represented as a linear combination of the first few natural modes of vibration of the dam alone. Responses to arbitrary ground motion can be obtained by Fourier synthesis procedures applied to the complex frequency response functions determined by the analysis procedures presented. The analysis procedure permits the effects of structure-fluid interaction to be included rationally in dynamic response of arch dams. Dam-water interaction, considering water compressibility, affects the radial acceleration response of dams to upstream-downstream and cross-stream ground motions to a similar degree. However, the response to vertical ground motion is greatly increased by these effects. Just as in the case of gravity dams, vertical ground motion causes significant hydrodynamic pressures. These pressures act in the horizontal plane on a cylindrical dam face, thus causing significant additional response. The additional hydrodynamic forces causes by bank motions in the upstream-downstream or cross-stream directions may significantly affect the dynamic response of arch dams at some excitation frequencies. MATHEMATICAL MODELING OF EARTH DAM BREACHES,

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
W. C. Lou.
PhD Thesis, 1981. 238 p, 66 Fig, 11 Tab, 128 Ref, 3 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-19715.

Descriptors: *Model studies, *Mathematical models, *Earth dams, *Dam failure, Sediment transport, Bank erosion, Slope degradation, Hydrographs, Flood discharge, *Teton Dam, *Mantaro Dam.

A mathematical model has been developed in order to predict the outflow hydrograph of earth dam breaches. The model is based on the water continuity and motion equations, the sediment continuity equation, a sediment transport equation and a breach form equation. In addition, another simple model was developed considering the Corps of Engineers - Schoklitsch discharge formula and Cristofano's approach for embankment erosion. The sediment transport discharge is considered according to two different approaches. The mechanism responsible for the breach formation is studied considering a section of greatest efficiency from the erosional stand-point, in which the geometric characteristics are functions of a new parameter: the embankment angle of repose. The second-order quasilinear hyperbolic system that includes continuity and motion equations, is implicitly solved by a four-point scheme in the space-time plane, considering the reservoir and a rating curve as boundary conditions upstream and downstream respectively. The spatial and temporal variations of the breach are combined with the unsteady water model yielding discharge and area along the embankment in each time step. The total sediment transport is explicitly calculated resulting in a new embankment profile, taking into consideration the updated boundary conditions. The validity of the mathematics' models was checked by applying them to two actual earth dam failures: the Teton Dam and the Mantaro Dam. Good agreement was obtained between the model and the observed data. (Sinha-OEIS)

HIGHLIGHTS OF THE ST. MARY'S REDEVELOPMENT PROJECT,

L. H. Anderson, and K. Overbeeke.
Canadian Water Resources Journal, Vol 6, No 3, p 197-242, 1981. 16 Fig, 3 Tab.

Descriptors: *Environmental effects, *Hydroelectric plants, *Construction, St. Mary's River, Sault Ste. Marie, *Ontario, Bulb turbines, Alternative planning, Planning, Water quality.

The St. Mary's Redevelopment project at Sault Ste. Marie, Ontario, is an example of redeveloping existing hydroelectric facilities installed between existing station, ice sluiceway, dikes, seepage cutoff trench, concrete gravity retaining wall, and deeper approach channel. Three horizontal bulb unit generators are scheduled to go on line starting August 1982. Advantages and disadvantages of seven alternatives for supplying the required power were evaluated. The environmental concerns were the waterfront, nature and recreational parks, archeological findings on Whitefish Island, a potential shipping canal, preservation of St. Mary's River rapids, fish remedial works, water quality, aquatic life, shoreline erosion, navigation, and restoration of borrow areas for construction materials. (Casear-FRC)

DICKSON DAM, ALBERTA - THE 20 MW POWER FACILITY,

R. J. Simpson, and J. P. Sengupta.
Canadian Water Resources Journal, Vol 6, No 3, p 178-196, 1981. 4 Fig, 5 Tab.

Descriptors: *Hydroelectric plants, *Dam design, *Dickson Dam, Red Deer River, *Alberta, Diversion structures, Economic aspects, Benefits, *Cost-benefit analysis, Hydraulic structures, Design criteria, Reservoirs, Powerplants, Environmental effects.

An $18 million, 20 MW 2-unit power facility was added to the plans for construction of the $112 million Dickson Dam on the Red Deer River, Alberta. The dam and its flow regulating structures were originally designed to provide a minimal seasonal regulated flow of 16 cu m per sec and to improve water quality. The design intakes for the 530 m twin diversion tunnels were enlarged slightly and the gate system modified for use as power tunnels. The break-down point for net benefits vs. capital construction occurs at a mill rate of 20.8 per kwh. The environmental benefits produced by the original plans are not expected to change due to the addition of the powerplant. The structures are expected to be in service in 1983. (Casear-FRC)

UNCERTAINTIES IN WATER DISTRIBUTION SYSTEMS,

D. A. Clarke, E. A. McBean, and S. A. Al-Nassri.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY10, p 1263-1267, October, 1981. 1 Fig, 10 Ref.

Descriptors: *Water distribution, *Pressure distribution, *Pipes, *Design criteria, Water mains, Pipelines, Mathematical studies, *Water supply systems.

As a means of examining the uncertainties in the design of a water distribution system, the sensitivity of the pressure difference is examined using the First Order Analysis method. The sensitivity of the pressure differential was examined across a pipe due to uncertainties in a mathematical model, discharge, hydraulic slope exponent, and Hazen-Williams's coefficient. These results were used to obtain a required accuracy of measurement devices for providing meaningful results in field measurement of pressure differentials along sections of distributed mains. Uncertainties in the input data of water distribution networks were substantial and could lead to meaningless results. (Small-FRC)

EFFICIENT COOLING PONDS DESIGN,
Cornell Univ., Ithaca. School of Civil and Environmental Engineering.
G. H. Jirka, C. F. Cerco, and D. R. F. Harleman.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1547-1563, 1981. 9 Fig, 2 Tab, 11 Ref.

Descriptors: *Cooling ponds, *Design criteria, Thermal water, *Powerplants, Thermal pollution, Heated water, Ponds, Cooling ponds, Circulation, Hydrodynamics.

The design of cooling ponds for the dissipation of waste heat from steam-electric power plants is considered, keeping in mind steady-state performance and transient performance. Particular emphasis is put on the design of shallow ponds, as defined by classification criteria proposed earlier, which lack a predominant vertical stratification and are dominated by the through flow hydrodynamics. Such ponds are frequently built by diking or excavating an offstream land area. A schematic laboratory study was performed to test the effect on pond performance of various design measures, notably internal baffle arrangements, discharge structures and a deep intake reservoir. An optimal pond design is suggested with moderate baffling to prevent recirculation zones, a radial discharge structure to minimize entrance mixing, and deep intake reservoir with a residence time of at least one half day to insure damping of diurnal intake temperature fluctuations. A moderate length/width ratio of 3-10 will require some amount of internal baffle to prevent recirculation zones. Given a common rectangular shape of available land, a U-shaped pond is frequently most attractive and a good tradeoff against the increased costs of a more dense baffle arrangement. (Baker-FRC)

SEDIMENTATION CONTROL IN INDIAN RESERVOIRS,
Edinburgh Univ. (Scotland).
E. J. McKeogh.
International Water Power and Dam Construction, Vol 33, No 10, p 41-43, October, 1981. 3 Fig, 6 Ref.

Descriptors: *Reservoirs, *Sedimentation, *Sediment control, *India, Dams, Soil erosion, Sediment transport.

The scale and complexity of the sedimentation problem in Indian reservoirs is discussed using data collected from as far back as 1870. Two basic approaches exist for sedimentation control: controlling soil erosion and handling sediment where it creates the problem. The first approach is preventive in nature, involving agronomic practices and management of vegetation. The second approach involves engineering measures. Sediment can be removed by various means, determined largely by the degree of sediment removal required. Conventional devices such as ejectors and vortex tubes have been used to remove sediment from canals, but only with partial success. The sediment removal system in use at the Beira Siul hydroelectric project in Himachal Pradesh is detailed. Large boulders are trapped in a recirculating zone and subsequently removed through the gates. Medium sediment is removed through a tunnel which emanates from the base of the channel. The remaining silt-laden flow is directed to a desilting basin. The average efficiency of the basin was found to be 94.5%. A description is also offered of the Trisuli power channel at the hydroelectric project in Nepal. Several devices for sediment exclusion from the canal were considered, from which a settling tank with flushing arrangement was selected for testing. (Baker-FRC)

OPTIMAL RISK-BASED DESIGN OF HYDRAULIC STRUCTURES,
Texas Univ. at Austin.
Y-K. Tung.
PhD Thesis, August, 1980. 420 p, 59 Fig, 41 Tab, 70 Ref, 9 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-00978.

Descriptors: *Hydraulic structures, *Model studies, Hydrologic aspects, Hydraulic models, Risks, Safety, Economic aspects, Statistical methods, Cost-benefit analysis, *Design criteria, Optimization, *Risk-based design.

A general framework for evaluating the risk and reliability of water resource engineering projects is developed which takes into account the uncertain features involved in both hydrologic and hydraulic aspects and parameter uncertainties. In most water resource engineering projects the evaluation of risk is limited to the consideration of the inherent hydrologic uncertainty while the hydrologic model and parameter uncertainties and the hydraulic uncertainties are ignored. This report illustrates that ignoring these additional uncertainties can lead to serious underestimates of the associated risks and consequently, underestimate the associated economic losses and safety hazard. First-order analysis is used to estimate the uncertainty of deterministic hydraulic models which have uncertain parameters. A new methodology for treating (minimizing) the hydrologic parameter uncertainty is developed that uses generalized parameter (mean, standard deviation, and skewness) values from a weighting between sample and regional hydrologic information. The methodology uses either of two nonparametric statistical techniques, the jackknife or the bootstrap, to determine variances of the sample parameters, and regression analysis is used to determine variances of the sample parameters. The hydrologic model uncertainty is treated using a weighting procedure by assigning a weight to various probability models considered. The generalized parameter estimates and the observations of sample data are both used. By doing so a composite probability model can be developed to define risk and reliability which reduces the uncertainty of adopting the probability model. (Sinha-OEIS)

Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY10, p 1243-1259, October, 1981. 1 Fig, 4 Tab, 28 Ref.

Descriptors: *Vortices, *Model studies, *Prototype tests, Hydraulic models, Flow, *Intakes, Eddies.

Past research on vortices and scale effects is reviewed and a new summary of model versus prototype observations is provided regarding vortex intensity. The data summary indicates that sufficient operating problems due to vortices have occurred to warrant reasonable efforts to minimize vortices at intakes. When hydraulic models operated at Froude-scaled flows are used to predict vortex intensity some scale effects occur, while some increase in model flows above Froude-scale values may eliminate these. Large increases, however, are not justified and may result in model distortion. In models with Froude-scaled flows which predicted only swirls and surface dimples, negligible scale effects were found. In this case, no air vortices would occur in the prototype. (Small-FRC)

BUOYANT SURFACE JETS,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
G. H. Jirka, E. E. Adams, and K. D. Stolzenbach.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1467-1487, 1981. 11 Fig, 1 Tab, 45 Ref.

Descriptors: *Dimensional analysis, *Jets, Hydraulics, Buoyancy, Plumes, Model studies, Thermal pollution, Heated water, Discharge measurement, *Fluid mechanics.

The fluid mechanical properties of buoyant surface jets entering various types of receiving waters are discussed. Then jet properties, such as mixing capacity and geometric scale, are defined using dimensional analysis, and these are then quantified through combined used of integral jet model predictions and field or laboratory observations. Not only are such relationships useful as initial estimates to define discharge behavior, mixing efficiency, regions of influence, and parametric sensitivity of different discharge design alternatives, but the results define limits of applicability of buoyant surface jet models. One application may be the establishment of criteria on transition distance and on bottom and shoreline attachment which can thus be used in the selection of appropriate predictive models. The study indicated that for deep stagnant receiving water, the buoyant jet has a certain transition length which is used to define the near field zone, a maximum penetration depth, and a limited dilution capacity which is predominantly met through bottom entrainment. These parameters are found to scale with a densimetric Froude number based on kinematic momentum and buoyancy fluxes and characteristic source length. A definition for shallow receiving water conditions is given on the basis of observation of reduced entrainment. Increasing shallowness decreases the jet mixing capacity and increases the length of bottom contact. A criterion is presented to distinguish free shoreline attached buoyant surface jets in crossflowing receiving water. A simple trajectory relation appears to describe the deflection of surface buoyant jets in crossflowing deep receiving water. (Baker-FRC)

UNIFORM FLOW CALCULATIONS FOR PIPES,
University of Strathclyde, Glasgow (Scotland). Dept. of Civil Engineering.
D. I. H. Barr.
Civil Engineering (London), p 15, 17, 21, 30, June, 1981. 3 Fig, 17 Ref.

Descriptors: *Pipe flow, *Mathematical studies, *Graphical analysis, Uniform flow, Turbulent flow, Laminar flow, Channel flow.

Non-dimensional auxiliary scales are presented for direct solutions for each of the basic pipe flow problems. This method has inherent accuracy in terms of solution of the Colebrook-White function and involves only one diagram. It covers a wider range of flow circumstances than the Akers method and places the solution within the context of the familiar resistance diagram. These procedures are not bounded by the limitation of applying only to rough turbulent conditions, as past

methods have been. These cover transition turbulent and smooth turbulent flow as well as laminar and laminar-turbulent transition flows. The diameter of equivalent pipe concept is used rather than the hydraulic mean depth as adopted by Akers, because the equivalent diameter integrates better with the mainstream of resistance diagram and numerical solution practice. This method is an alternative for both pipe and open channel problems which provides valuable elements of direct representation and visualization of the flow circumstances involved. (Small-FRC)

CONTINUOUS ION EXCHANGE: DESIGN CALCULATIONS,
M. J. Slater.
Effluent and Water Treatment Journal, Vol 21, No 10, p 461, 464-466, October, 1981. 3 Fig, 14 Ref.

Descriptors: *Ion exchange, *Design criteria, Resins, Fluidized bed process, Wastewater treatment, Water treatment, Fluidized beds, Packed beds, Filters.

Assessment is made of the design principles for packed and fluidized bed ion exchange plants, both fixed bed and continuous flow systems. Use and validity of laboratory experiments in the generation of data for large plants are discussed. The relationship between packed and fluidized types of operation is demonstrated by analytical design equations. Axial mixing of liquid fluidized beds is considered, and its impact on scale-up is demonstrated. It is concluded that binary systems are amenable to mathematical interpretation with some simplification, and multi-component systems can be simulated by computer if all the relevant equilibrium and kinetic data are determined. Fluidized bed systems suffer mixing of liquid and resin, which can be characterized sufficiently well to demonstrate the importance of changing flow patterns on scaling-up and the need to justify use by treating dirty liquids. 8D. Soil Mechanics

DETERMINING OF SEISMIC EARTH PRESSURE ON A RIGID RETAINING WALL,
B. M. Bakhtin, and V. K. Nguen.
Hydrotechnical Construction, No 1, p 70-77, January, 1980. 4 Fig, 1 Tab, 11 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 1, p 41-45, January, 1980.

Descriptors: *Seismic properties, *Dam stability, *Retaining walls, Soil mechanics, Dam failure, Hydraulic structures, Earthquakes, Soil pressure.

A method for calculating the seismic earth pressure on a retaining wall, such as a dam, is proposed. If a rigid wall prevents movement of the earth, the energy of a seismic wave will be manifested as a dynamic earth pressure on the wall. It is expected that the pressure on a rigid retaining wall would be maximum near the top and decrease approaching the base. The results of calculations using the Construction Norms and Regulations method and the Rukhadze method (1965) were considerably different from those obtained using the method developed in this paper. Investigations on a plaster model of a retaining wall 10 cm high, 5 cm at the crest, 20 cm at the base, and 100 cm long showed that the diagram of the intensity of the seismic earth pressure had the form of an inverted triangle with the vertex at the base of the wall. The seismic pressure of cohesionless soil on a rigid wall was more dependent on the elastic characteristics of the soil medium and less on the angle of internal friction. The standard methods of determining loads from seismic earth pressure underestimated the design volume of the wall by 5-7%. According to calculations, the most likely type of failure for walls during earthquakes is overturning. This is consistent with reported cases of wall failure. (Cassar-FRC)

MODEL STUDIES OF AN OVERTOPPED ROCKFILL DAM,
M. Gerodetti.
International Water Power and Dam Construction, Vol 33, No 9, p 25-31, September, 1981. 6 Fig, 11 Ref.

Descriptors: *Dam stability, *Cofferdams, *Gabions, Rockfill dams, *Model studies, El Cajon, *Honduras, Hydraulic structures, Anchors, Overflow.

Results of tests and design concepts for the rockfill cofferdam at the El Cajon hydroelectric project in Honduras are described. Specifications stated that the 40 m high cofferdam, with steel sheetpile center wall, must withstand overtopping. Gabions are used to protect the downstream surface and part of the upstream side. In scale model tests unanchored gabions allowed severe disruption of the embankment at low flows. Inserting anchors protected the dam from high flows and from seepage water, which is significant. It is important that the grain size of stones in the gabion be filled with material coarser than the mesh. (Cassar-FRC)

FILTER CRITERIA FOR SUB-SURFACE DRAINAGE,
B. Harrison.
Civil Engineering (London), p 22, 24, 26, April, 1981. 2 Fig, 2 Tab, 10 Ref.

Descriptors: *Drainage systems, *Subsurface filters, Design criteria, *Filters, Filtration, Drainage, Drainage engineering, Subsurface drainage.

The use of lightweight, easily placed and cost effective filter membranes of geotextiles replaced the need for costly graded aggregate filters for several purposes. In the United States their original use was as an alternative to graded natural filters beneath rip-rap on coastal protection schemes. Use has spread to pipe and aggregate wraps for subsurface drains, separators for temporary or permanent roads, filters for piezometer tips and well screens, drainage blankets to sports fields, components of reinforced earth construction and others. It is noted that too conservative an approach, depicted as using small mesh or pore opening sizes, may be unacceptable for long-term filtration performance. The only geotextile filter criterion released to date that allows for the controlled passage is the Trammel filter criterion, based on the Elmer curve. Allowing maximum mesh opening size while maintaining adequate retention and providing sufficient open areas minimizes the risk of clogging. (Baker-FRC)

CAVITATION-RESISTANT GUNITE COATINGS FOR HYDRAULIC STRUCTURES,
L. N. Gomolko, I. S. Novikova, S. V. Sharkunov, and G. N. Tsedrov.
Hydrotechnical Construction, No 6, p 587-589, June, 1980. 2 Fig, 1 Tab, 2 Ref. Translated from Gidroteknicheskoe Stroitel'stvo, No 6, p 28-29, June, 1980.

Descriptors: *Gunite, *Cavitation, *Hydroelectric plants, *Hydraulic structures, *Materials engineering, *USSR, Water conveyance, Conduits, Concrete technology, Tunnel linings, Linings, Coatings.

Gunite showed increased cavitation resistance as compared with conventional concrete in laboratory tests. The composition of gunite mixtures and the cavitation erosion in grams per hour were as follows: gunite-sand (1:2), cement grade 300, 0.75; 1:3 mixture, cement grade 300, 2.53; 1:4 mixture, cement grade 300, 2.90; 1:2 mixture, cement grade 400, 0.38; and cement grade 400 without gunite, 0.76. Cavitation was produced by a rod 20 mm in diameter at stream velocities of 27 m per sec. This corresponds to the velocity of water near the wall in a water conduit, where the average flow is about 40 m per sec. (Cassar-FRC)

9A. Education (Extramural)

PROFESSIONAL DEVELOPMENT FOR WATER QUALITY CONTROL PERSONNEL,
Ohio State Univ., Columbus.
C. L. Shepard.
PhD Thesis, 1980. 149 p, 13 Fig, 28 Tab, 127 Ref, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-22345.

Descriptors: *Education, *Professional personnel, *Water quality control, Wastewater treatment, *Continuing education, Questionaires, Personnel requirements.

Generalizations based on the findings of this study must take into account the particular samples of respondents, the nature of the survey instrument, and the procedures used to analyze the data. However, in view of the information yielded, certain conclusions seem warranted. There is a significant lack of educational opportunities for the professional development of water quality control personnel. The response regarding available education opportunities is not consistent with the amount of participation indicated by personnel. There are differences among the states in their approach to water quality control and requirements for operations personnel. Employee classification, education level, and municipal size as variables are related to participation in, familiarity with, and importance attached to continuing education-professional development opportunities. There are areas of common agreement on the education opportunities relevant for water quality control personnel across employment classifications. There are differences between supervisors and technicians in the overall rankings for educational opportunities. The respective rankings of each group coincide directly with job responsibilities. The survey methodology provides a usable technique to collect information from water quality control personnel regarding relevant educational opportunities. Wastewater treatment plant personnel can be surveyed for the purpose of obtaining data on relevant educational opportunities for water quality control personnel. (Sinha-OEIS)

TRAINING PROGRAMMES FOR BETTER WATER MANAGEMENT IN SURFACE IRRIGATION PROJECTS IN INDIA,
Mahi-Kadana Irrigation Project, Ahmedabad (India).
T. K. Jayaraman.
Water Supply and Management, Vol 5, No 3, p 261-272, 1981. 2 Fig, 2 Tab, 17 Ref.

Group 9B—Education (In-House)

Descriptors: *Irrigation projects, *Management, Planning, Training, Water resources development, Water supply, Water supply development, *India.

A serious problem which has adversely affected the performance of irrigation projects in India has been a lack of professionalization in water management tasks. One of the two suggested solutions to this problem calls for providing training programs for the project personnel serving in the spheres of operation and maintenance and irrigated agriculture extension and production. The programs visualized are for both in-service personnel and those entering the projects as fresh recruits. A training institution is to be located in a representative command area. Once these programs are initiated and run, the other solution of setting up a separate water management cadre becomes obvious and easier to implement as a logical sequel to the training programs. STORAGE AND RETRIEVAL OF GROUND-WATER DATA AT THE U.S. GEOLOGICAL SURVEY,
Geological Survey, Reston, VA. Water Resources Div.
M. W. Mercer, and C. O. Morgan.
Ground Water, Vol 19, No 5, p 543-551, September/October, 1981. 7 Fig, 2 Tab, 10 Ref.

Descriptors: *Information systems, *Data collections, *Groundwater, Information retrieval, Data storage and retrieval, Computers, Wells, Springs, U.S. Geological Survey, National Water Data Exchange.

A computerized groundwater site inventory (GWSI) file, maintained by the U.S. Geological Survey, contains information on wells and springs at 770,000 sites (as of February 1981) throughout the U.S. This hierarchically structured data base is part of the central water resources data file known as National Water Data Storage and Retrieval System (WATSTORE). Data input is reviewed for accuracy before being entered into the file. Indexed information is stored randomly on a disk file. Among the many types of information in the file are location, construction, geology, water quality, and production. Data is retrieved by a natural language system or by a backup system in a higher program language. Users may request information by computer or by writing the U.S. Geological Survey at Reston, Virginia, or at any of 58 assistance centers listed in a table. (Cassar-FRC)

Mixed Bed Technology for Polishing Make-Up Water and Condensate Return, Part One,
W82-03471 5F

BOTTOM SEDIMENTS
Size Distribution of Amazon River Bed Sediment,
W82-03488 2J

BRAZIL
Flow-Augmentation and Water Quality in Paraiba Do Sul River Basin-Brazil,
W82-03744 5G

BRINE
Dissolution of Salt on the East Flank of the Permian Basin in the Southwestern U.S.A.,
W82-03586 2F

BRINES
The Origin and Evolution of Saline Formation Water, Lower Cretaceous Carbonates, South-Central Texas, U.S.A.,
W82-03540 2F

Patterns of Groundwater Salinity Changes in a Deep Continental-Oceanic Transect Off the Southeastern Atlantic Coast of the U.S.A.,
W82-03582 2F

Character of Brines from the Belle Isle and Weeks Island Salt Mines, Louisiana, U.S.A.,
W82-03584 2F

BRITISH COLUMBIA
Peace River Site C Project: Environmental Studies; Development of a Mitigation and Compensation Program; and Project Licensing,
W82-03618 6G

CADMIUM
An In Situ Study of Cadmium and Mercury Stress in the Plankton Community of Lake 382, Experimental Lakes Area, Northwestern Ontario,
W82-03612 5C

Movement of Cadmium and Water in Split-Root Wheat Plants,
W82-03662 5B

Detoxication of Zinc and Cadmium by the Freshwater Protozoan Tetrahymena Pyroformis. I. The Effect of Water Hardness,
W82-03678 5C

Cadmium in an Aquatic Ecosystem,
W82-03724 5A

CALCIUM
Effect of Waters of Various Hardness on the Cardiovascular System. (O Vliyanii vod Raznoi Zhestkosti na Serdechno Sosudistuyu Sistemu),
W82-03699 5C

CALIFORNIA
Environmental Regulation and Constraints Upon Small Hydro Development in California, U.S.A.,
W82-03614 6E

The Occurrence and Control of Land Subsidence Due to Ground-Water Withdrawal with Special Reference to the San Joaquin and Santa Clara Valleys, California,
W82-03714 4B

New Legislation in California and Its Effects,
W82-03731 6E

SB 1391--Towards a Permit System for Ground Water. Towards a New Definition of Ownership of Ground Water,
W82-03736 6E

CANADA
On Hydrological Data Needs in Canada,
W82-03443 7A

Current Assessment of Prospects for Further Hydro Development in Canada,
W82-03620 6B

CAPE MAY
Rapid Sewer Analysis Saves Tourist Season,
W82-03694 5G

CAPILLARY WATER
Movement of Cadmium and Water in Split-Root Wheat Plants,
W82-03662 5B

CAPITAL COSTS
Treating Infiltration at Its Source Reduces Capital Costs,
W82-03564 5D

CARBARYL
High Performance Liquid Chromatographic Determination of Carbaryl and 1-Naphthol at Residue Levels in Various Water Sources by Direct Injection and Trace Enrichment,
W82-03444 5A

CARBON CYCLE
Photosynthetic Bacterial Production and Carbon Mineralization in a Meromictic Lake,
W82-03403 2H

CARBON FILTERS
Anaerobic Activated Carbon Filter for the Treatment of Phenol-Bearing Waste Water,
W82-03680 5D

CARBON RADIOISOTOPES
Carbon Isotope Analysis of Carbonaceous Compounds in Puget Sound and Lake Washington,
W82-03505 5A

CARBONATE AQUIFERS
The Origin and Isotopic Composition of Dissolved Sulfide in Groundwater from Carbonate Aquifers in Florida and Texas,
W82-03644 2K

CARCINOGENS
Carcinogenesis of Synthetic Organic Chemicals in Drinking Water,
W82-03433 5C

CARPATHIAN MOUNTAINS
Effect of Felling Forests on Flood Runoff in the Carpathian Mountains with Special Reference to Beech Forests,
W82-03574 4C

CATCHMENT BASINS
'Nadis', The Vital Water Resources of the Indian Arid Zone,
W82-03413 3B

CATFISH
Persistence of Dieldrin in Water and Channel Catfish from the Des Moines River, Iowa, 1971-73 and 1978,
W82-03590 5B

Hemosiderin Granules: Cytotoxic Response to Arsenic Exposure in Channel Catfish,
W82-03607 5C

CAVITATION
Cavitation-Resistant Gunite Coatings for Hydraulic Structures,
W82-03677 8G

CHALK FORMATION
Identification of Connate Water in Interstitial Solution of Chalk Sediment,
W82-03642 2K

CHANNEL FLOW
Parametric Study of Flood Wave Propagation,
W82-03425 2E

CHEMICAL ANALYSIS
The Characterization and Analysis of Chlorinated Organic Compounds Derived from Chlorination of Humic Substances in Surface Waters,
W82-03529 5A

Water Chemistry of Alabama Ponds,
W82-03534 2K

Character of Brines from the Belle Isle and Weeks Island Salt Mines, Louisiana, U.S.A.,
W82-03584 2F

CHEMICAL COMPOSITION
Hydrochemical Balance of an Alpine Watershed in Southeast Alaska,
W82-03402 2K

CHEMICAL INTERFERENCES
Studies of the Transformations of Forms of Carbon, Nitrogen, Phosphorus, Sulfur and Some

CHEMICAL [illegible]
Principal Mineral Elements During the Measurement of the Total Oxygen Demand - II. Transformation of Forms of Nitrogen (In French),
W82-[illegible] 5A

CHEMICAL OXYGEN DEMAND
Coliform and Chemical Oxygen Demand Removal from Meatworks Effluents by Different Treatment Processes,
W82-03570 5D

Functional Relations Between General Characteristics of Organic Matter in Natural Waters,
W82-03573 1A

CHEMICAL PROPERTIES
Factors of the Chemical Composition of Seepage and Groundwaters in the Intertropical Zone (West Africa),
W82-03543 2K

CHEMICAL STRATIFICATION
Stratification and Mixing in Shallow Tropical African Lakes,
W82-03514 2H

CHEMICAL WASTES
Rocky Mountain Arsenal: Landmark Case of Groundwater Polluted by Organic Chemicals, and Being Cleaned Up.
W82-03458 5B

Dutch Dumps,
W82-03738 5B

CHILE
Isotope Hydrology of Groundwaters in the Pampa Del Tamarugal, Chile,
W82-03651 2F

CHLORAMINES
A Novel Chloramine Compound for Water Disinfection,
W82-03551 5F

CHLORIDES
Ground Water Seepage in Lake Washington and the Upper St. Johns River Basin, Florida,
W82-03546 2H

CHLORINATED HYDROCARBONS
An Organics Detection System for the Ohio River,
W82-03436 5A

Response of Trout Hepatic Mixed-Function Oxidases to Experimental Feeding of Ten Known or Possible Chlorinated Environmental Contaminants,
W82-03609 5C

CHLORINATION
Chlorination of Drinking Water and Pregnancy Outcomes in New York Villages, 1968-1977,
W82-03506 5C

Trihalomethane Formation from Humic Materials in Chlorinated Reclaimed Wastewater,
W82-03517 5D

Kinetics of Trihalomethane Formation in Lyophilized Potomac Water,
W82-03596 5F

CHROMATOGRAPHY
Orthophosphate and Its Flux in Lake Waters,
W82-03613 2H

CHROMIUM
Removal of Hexavalent Chromium from Estuarine Waters by Model Substrates and Natural Sediments,
W82-03637 5G

CLEANING
Effect of Slime Stuck Inside Sampling Pipings on Water Quality and How to Remove It,
W82-03585 5D

CLEAR-CUTTING
Temporary Hydrologic Changes After Deforestation for Pioneer Homesteading,
W82-03544 4C

Effect of Felling Forests on Flood Runoff in the Carpathian Mountains with Special Reference to Beech Forests,
W82-03574 4C

COAGULATION
Optimizing Coagulation with Pilot Filters and Zeta Potential,
W82-03653 5F

Predicting Suspended Solids Removal in Pilot Scale Sediment Ponds Utilizing Chemical Flocculation,
W82-03725 5D

COAL PILE RUNOFF
Simulating Coal Pile Runoff as a Design Tool,
W82-03692 5B

COASTAL AQUIFERS
Boundary Integral Equation Solutions to Moving Interface Between Two Fluids in Porous Media,
W82-03577 2F

Patterns of Groundwater Salinity Changes in a Deep Continental-Oceanic Transect Off the Southeastern Atlantic Coast of the U.S.A.,
W82-03582 2F

COASTAL WATERS
Mineral Element Content in Ulva Lactuca L. with Reference to Eutrophication in Hong Kong Coastal Waters,
W82-03417 5B

COBALT
Movement of Cobalt in Freshwater Micro-Ecosystems,
W82-03524 2H

COFFERDAMS
Model Studies of an Overtopped Rockfill Dam,
W82-03694 8E

COLOR REMOVAL
Removing Color and Chloroform Precursors from Low Turbidity Waters by Direct Filtration,
W82-03657 5F

COLORADO
Stream Macroinvertebrate Baseline Surveys: A Comparative Analysis from the Oil-Shale Regions of Colorado, USA,
W82-03635 5A

COLORADO RIVER BASIN
Optimizing Salinity Control Strategies for the Upper Colorado River Basin,
W82-03518 6B

COMBINED SEWER OVERFLOW
A Wet-Weather Model for Evaluating the Combined Effects of Storm-Sewage Overflows and Sewage-Works' Effluents Upon River Quality,
W82-03427 5B

COMPACTION
The Occurrence and Control of Land Subsidence Due to Ground-Water Withdrawal with Special Reference to the San Joaquin and Santa Clara Valleys, California,
W82-03714 4B

COMPUTER PROGRAMS
Inverse Solutions of the Theis Equation Determined with Programmable Calculators. II. Determination of Aquifer Hydraulic Constants from Numerical Test Data,
W82-03481 2F

Moisture Movement in Soils in the Vicinity of Waste Disposal Sites,
W82-03728 2G

COMPUTERS
Improving Treatment Works Efficiency.
W82-03500 5D

CONDENSATES
Mixed Bed Technology for Polishing Make-Up Water and Condensate Return, Part One,
W82-03471 5F

CONNATE WATER
Identification of Connate Water in Interstitial Solution of Chalk Sediment,
W82-03642 2K

CONSTRUCTION
How Do You Build When Sewers Are Inadequate,
W82-03592 5D

Highlights of the St. Mary's Redevelopment Project,
W82-03617 8A

CONSTRUCTION METHODS
'Nadis', The Vital Water Resources of the Indian Arid Zone,
W82-03413 3B

CONTINUING EDUCATION
Professional Development for Water Quality Control Personnel,
W82-03531 9A

CONTROL SYSTEMS
Improving Treatment Works Efficiency.
W82-03500 5D

Optimizing Coagulation with Pilot Filters and Zeta Potential,
W82-03653 5F

CONVEYANCE STRUCTURES
Use of Combined Cyclic-Continuous Technology in Earth-Dam Construction,
W82-03498 8A

COOLING PONDS
Efficient Cooling Ponds: Design,
W82-03672 8A

CORRELATION FUNCTIONS
Rainfall Interstation Correlation Functions. II. Application to Three Storm Models with the Percentage of Dry Days as a New Parameter,
W82-03422 2B

Rainfall Interstation Correlation Functions. I. An Analytic Approach,
W82-03467 2B

COST ANALYSIS
Current Assessment of Prospects for Further Hydro Development in Canada,
W82-03620 6B

COST BENEFIT ANALYSIS
Optimizing Salinity Control Strategies for the Upper Colorado River Basin,
W82-03518 6B

Potential Impact of Irrigation on Water Resources in the Little Wabash Basin of Illinois,
W82-03547 6D

Water Metering and Conservation,
W82-03562 3D

Dickson Dam, Alberta - The 20 MW Power Facility,
W82-03621 8A

Upgrading to Increase Treatment Capacity,
W82-03654 5F

CRESOLS
Effects of Some Representative Petroleum Refinery Effluent Compounds on Photosynthesis and Growth of Natural Marine Phytoplankton Assemblages: Part I--Cresols,
W82-03470 5C

CROP PRODUCTION
Modeling the Economics of Ground Water Management,
W82-03733 4B

CROP YIELD
Yield and Development of Soybeans (Glycine Max L.) as Affected by Irrigation with Municipal Wastewater and Well Water,
W82-03723 3C

An Economic Approach to Ground Water Quality Management,
W82-03732 5G

CRYSTALLIZATION
Water Softening by Crystallization,
W82-03750 5F

CYCLING NUTRIENTS
Nutrient Relationships in Shallow Water in an African Lake, Lake Naivasha,
W82-03404 2H

DAIRY INDUSTRY
Some Methods Available for Treatment of Waste Water in the Dairy Industry,
W82-03650 5D

DAM CONSTRUCTION
Use of Combined Cyclic-Continuous Technology in Earth-Dam Construction,
W82-03498 8A

DAM DESIGN
Dickson Dam, Alberta - The 20 MW Power Facility,
W82-03621 8A

DAM FAILURE
Mathematical Modeling of Earth Dam Breaches,
W82-03532 8A

DAM STABILITY
Determining of Seismic Earth Pressure on a Rigid Retaining Wall,
W82-03497 8D

Model Studies of an Overtopped Rockfill Dam,
W82-03694 8E

DAMS
The New Energy Boom: Small-Scale Hydropower,
W82-03462 8A

DATA COLLECTIONSS
Storage and Retrieval of Ground-Water Data at the U.S. Geological Survey,
W82-03649 10B

DATING
Palaeoecological Studies of the Recent Development of Lake Vaxjosjon. III. Reassessment of Recent Chronology on the Basis of Modified Pb210 Dates,
W82-03480 5B

DEAD SEA
Solubilities of Gypsum and Halite in the Dead Sea and in Its Mixtures with Seawater,
W82-03708 2K

DEEP WELLS
A Closer Look at Deep Well Disposal of Wastes,
W82-03646 5E

DEFORMATION
The Role of Pore Pressure in Deformation in Geologic Processes,
W82-03706 2F

DEGRADATION
Degradation of Polychlorinated Biphenyls in Sediments of the Great Lakes,
W82-03536 5B

DELTAS
Methanogenesis in Marine Sediments of the Mississippi River Delta,
W82-03533 5B

DEPOSITION
Procedures for Estimating Dry Weather Pollutant Deposition in Sewer Systems,
W82-03679 5D

DESALINATION
Hygienic Evaluation of the Polyamide Membrane Pheylone-2S and Phenol Formaldehyde Resin VIAM-B for Use in Reverse Osmosis Treatment of Water. (Gigienicheskaya Otsenka Poliamidnykh Membran Fenilon-2S I Fenolformal'Degidnoi Smoly VIAM B, Primenenyemykh pri Obratnoosmoticheskom Oprechnenii Vody),
W82-03698 3A

Salt Removal from Brackish Water by Continuous Processes with Amphoteric, Thermally Regenerable Ion-Exchange Resins,
W82-03726 3A

DESALINATION PLANTS
From Screening to Filtration: Treating the Water Supply,
W82-03739 3A

DESIGN CONSIDERATIONS
Tampa's Hookers Point Awt Plant Working Well.
W82-03455 5D

DESIGN CRITERIA
Innovations in Wastewater Treatment Processes: Design Background Documents Due In 1981,
W82-03453 5D

Designing an Energy-Efficient Wastewater Treatment Plant.
W82-03477 5D

Designing for Coarse Sand Filtration Systems,
W82-03478 5D

Project Report, Planning and Design Development Kaw Point Wastewater Treatment Plant, Kansas City, Kansas,
W82-03525 5D

Design Manual; Onsite Wastewater Treatment and Disposal Systems,
W82-03538 5D

Continuous Ion Exchange: Design Calculations,
W82-03623 8C

Uncertainties in Water Distribution Systems,
W82-03668 8A

Efficient Cooling Ponds: Design,
W82-03672 8A

Optimal Risk-Based Design of Hydraulic Structures,
W82-03710 8A

DESIGN FLOW
Analysis of Waste Load Allocation Procedures,
W82-03550 5G

DESTRATIFICATION
The Effect of Artificial Destratification on Physico-Chemical Parameters and Phytoplankton in Ham's Lake, Oklahoma,
W82-03510 5G

DETECTION LIMITS
Trace Analyses for Wastewaters,
W82-03639 5A

DICKSON DAM
Dickson Dam, Alberta - The 20 MW Power Facility,
W82-03621 8A

DIELDRIN
Persistence of Dieldrin in Water and Channel Catfish from the Des Moines River, Iowa, 1971-73 and 1978,
W82-03590 5B

DIFFUSION COEFFICIENT
Groundwater Quality Improvement Through Nonlinear Diffusion,
W82-03652 5G

DIFFUSION COEFFICIENTS
The Calculation of Ion Pair Diffusion Coefficients: A Comment,
W82-03487 1B

DIFFUSIVITY
Intraparticle Diffusivity of Methylene Blue into Porous Activated Carbon,
W82-03601 5F

DIMENSIONAL ANALYSIS
Buoyant Surface Jets,
W82-03670 8B

DISINFECTION
Trihalomethanes in Drinking Water,
W82-03447 5F

A Novel Chloramine Compound for Water Disinfection,
W82-03551 5F

Ozone for Municipal Wastewater Disinfection,
W82-03559 5D

DISTRIBUTION PATTERNS
Comparison of Results Obtained with the VIDIAZ Spectropluviometer and the Joss-Waldvogel Rainfall Disdrometer in a 'Rain of a Thundery Type',
W82-03707 2B

DIVERSION
Asynchronism and Uncorrelated Phases of Streamflow in the Case of Its Interbasin Transfer with Special Reference to the Georgian SSR,
W82-03457 4A

DIVERSION DAMS
Asynchronism and Uncorrelated Phases of Streamflow in the Case of Its Interbasin Transfer with Special Reference to the Georgian SSR,
W82-03457 4A

DOMESTIC WASTES
Design Manual; Onsite Wastewater Treatment and Disposal Systems,
W82-03538 5D

DRAINAGE AREAS
Safe-Yield Estimates of a Water Supply Reservoir on an Ungaged Stream,
W82-03716 2E

DRAINAGE EFFECTS
Ground Water Seepage in Lake Washington and the Upper St. Johns River Basin, Florida,
W82-03546 2H

DRAINAGE SYSTEMS
Filter Criteria for Sub-Surface Drainage,
W82-03660 8G

DRINKING WATER
Outbreaks of Waterborne Disease in the United States: 1971-1978,
W82-03430 5B

Carcinogenesis of Synthetic Organic Chemicals in Drinking Water,
W82-03433 5C

Chlorination of Drinking Water and Pregnancy Outcomes in New York Villages, 1968-1977,
W82-03506 5C

Effect of Waters of Various Hardness on the Cardiovascular System. (O Vliyanii vod Raznoi Zhestkosti na Serdechno Sosudistuyu Sistemu),
W82-03699 5C

DROUGHT RESISTANCE
Drought Resistance of Sorghum Bicolor L. Moench. 3. Seed Germination Under Osmotic Stress,
W82-03479 2I

EARTH DAMS
Use of Combined Cyclic-Continuous Technology in Earth-Dam Construction,
W82-03498 8A

Mathematical Modeling of Earth Dam Breaches,
W82-03532 8A

FEDERAL JURISDICTION
Clean Water Act.
W82-03687 6E

Comments on a National Ground-Water Protection Strategy,
W82-03740 6F

FEEDLOT RUNOFF
Environmental Effects of Applying Feedlot Runoff to Grassland Plots by Sprinkler Irrigation,
W82-03528 3C

FERTILIZERS
Losses of Nitrogen, Phosphorus and Potassium from Agricultural Watersheds of Minor Rivers in the Oka Valley,
W82-03556 5B

FILTER MEDIA
Methods for Evaluating Performance of Filter Media,
W82-03661 5F

FILTERS
Comparative Performance of Dual- and Mixed-Media Filters,
W82-03659 5F

Filter Criteria for Sub-Surface Drainage,
W82-03660 8G

FILTRATION
Designing for Coarse Sand Filtration Systems,
W82-03478 5D

Upgrading to Increase Treatment Capacity,
W82-03654 5F

Declining-Rate Filtration,
W82-03656 5F

Removing Color and Chloroform Precursors from Low Turbidity Waters by Direct Filtration,
W82-03657 5F

FINANCIAL ASPECTS
Central City Demands in the 80's Woonsocket, Rhode Island,
W82-03665 5F

FISH
Study of the Transfer of Cd, Pb, Cu and Zn in Neritic and Estuarine Trophic Chains - II. Biological Accumulation in Planktonophage Fish. (Etude du Transfert de Cd, Pb, Cu et Zn dans les Chaines Trophiques Neritiques et Estuariennes-II. Accumulation Biologique Chez les Poissons Planctonophages),
W82-03491 2L

Neurochemical and Physiological Changes in a Teleost Fish Induced by Exposure to the Water Soluble Fraction of South Louisiana Crude Oil or Its Toxic Aromatic Components,
W82-03511 5C

Temperature Effects on Hydrazine Toxicity to Bluegills,
W82-03603 5C

Hemosiderin Granules: Cytotoxic Response to Arsenic Exposure in Channel Catfish,
W82-03607 5C

Response of Trout Hepatic Mixed-Function Oxidases to Experimental Feeding of Ten Known or Possible Chlorinated Environmental Contaminants,
W82-03609 5C

FISH POPULATIONS
Analysis of Temporal Changes in Fish Assemblages in Serpentine Creek, Queensland,
W82-03407 2L

FISHERIES
The Chemistry and Fishery Status of Acid Lakes in Norway and Their Relationship to European Sulphur Emissions,
W82-03418 5C

Eastern Scheldt Design Has Changed.
W82-03493 8A

FISHKILL
Evidence for Metal Poisoning in Acute Deaths of Large Red Drum (Sciaenops Ocellata),
W82-03606 5C

FITZROY RIVER
Effects of a Barrage on Flushing and Water Quality in the Fitzroy River Estuary, Queensland,
W82-03705 4A

FJORDS
Deep Water Renewal in Subarctic Fjord,
W82-03675 2L

FLOCCULATION
Upgrading to Increase Treatment Capacity,
W82-03654 5F

Upgrading Water Treatment Plants in San Diego,
W82-03655 5F

Predicting Suspended Solids Removal in Pilot Scale Sediment Ponds Utilizing Chemical Flocculation,
W82-03725 5D

FLOOD DAMAGE
Flood Area Modelling from an Elementary Data Base,
W82-03581 2E

FLOOD DISCHARGE
Effect of Felling Forests on Flood Runoff in the Carpathian Mountains with Special Reference to Beech Forests,
W82-03574 4C

FLOOD HYDROGRAPHS
Flood Area Modelling from an Elementary Data Base,
W82-03581 2E

FLOOD IRRIGATION
Irrigation, Crop Yield and Drainage on the Vaalharts Irrigation Scheme: 2. The Occurence of and the Influence of Drainage on Salinized Soil (In Afrikaans),
W82-03466 4B

FLOOD PLAIN MANAGEMENT
Flood Area Modelling from an Elementary Data Base,
W82-03581 2E

FLOOD WAVES
Parametric Study of Flood Wave Propagation,
W82-03425 2E

FLORIDA
The Effect of Organic Material and Inorganic Ions on the Photosynthetic Rate of Red Alga Bostrychia Binderi from a Florida Estuary,
W82-03423 2L

Ground Water Seepage in Lake Washington and the Upper St. Johns River Basin, Florida,
W82-03546 2H

Balanus Eburneus: A Sensitive Indicator of Copper and Zinc Pollution in the Coastal Zone,
W82-03605 5A

Evidence for Metal Poisoning in Acute Deaths of Large Red Drum (Sciaenops Ocellata),
W82-03606 5C

Microbiological Quality of Selected Recreational Waters,
W82-03636 5A

The Origin and Isotopic Composition of Dissolved Sulfide in Groundwater from Carbonate Aquifers in Florida and Texas,
W82-03644 2K

Upgrading to Increase Treatment Capacity,
W82-03654 5F

FLOTATION
Oil-Water Separation by Induced Air Flotation,
W82-03719 5D

FLOW AUGMENTATION
Flow-Augmentation and Water Quality in Paraiba Do Sul River Basin-Brazil,
W82-03744 5G

FLOW MEASUREMENT
A Portable Apparatus for the Measurement of Rate of Flow by the Lithium-Tracer Method,
W82-03428 7B

FLOW PROFILES
Hydraulic Exponents,
W82-03669 2E

SWMM Model and Level of Discretization,
W82-03673 6A

FLUID MECHANICS
Surface Viscosity of Water,
W82-03501 1A

Numerical Simulation of Reservoirs,
W82-03504 6A

Buoyant Surface Jets,
W82-03670 8B

FLYNN CREEK
Bedload Transport in an Oregon Coast Range Stream,
W82-03548 2J

FOOD CHAINS
Study of the Transfer of Cd, Pb, Cu, and Zn in Neritic and Estuarine Trophic Chains - I. State in the Internal Estuary of the Loire (France) During the Summer of 1978. (Etude du Transfert de Cd, Pb, Cu et Zn dans les Chaines Trophiques Neritiques et Estuariennes - I. Etat dans l'Estuaire Interne de la Loire (France) au Cours de l'Ete 1978),
W82-03492 5B

FOREST MANAGEMENT
Will the World Face Up to Its Ever-Worsening Environmental Problems.
W82-03459 4C

FOREST SOILS
Effect of Felling Forests on Flood Runoff in the Carpathian Mountains with Special Reference to Beech Forests,
W82-03574 4C

Trace Elements in the Hydrologic Cycle of a Forest Ecosytem,
W82-03690 5B

FORESTRY
Identification and Determination of Aminocarb in Natural Water and Balsam Fir Foliage. (Recherche et Dosage De L'Aminocarb Dans Les eaux Naturelles et le Feuillage Du Sapin Baumier Par Chromatographie en Phase Gazeuse),
W82-03460 5A

FOUNDRY COVE
Cadmium in an Aquatic Ecosystem,
W82-03724 5A

FRANCE
Study of the Transfer of Cd, Pb, Cu and Zn in Neritic and Estuarine Trophic Chains - II. Biological Accumulation in Planktonophage Fish. (Etude du Transfert de Cd, Pb, Cu et Zn dans les Chaines Trophiques Neritiques et Estuariennes-II. Accumulation Biologique Chez les Poissons Planctonophages),
W82-03491 2L

Study of the Transfer of Cd, Pb, Cu, and Zn in Neritic and Estuarine Trophic Chains - I. State in the Internal Estuary of the Loire (France) During the Summer of 1978. (Etude du Transfert de Cd, Pb, Cu et Zn dans les Chaines Trophiques Neritiques et Estuariennes - I. Etat dans l'Estuaire Interne de la Loire (France) au Cours de l'Ete 1978),
W82-03492 5B

Sulfur and Oxygen Isotopes as Tracers of the Origin of Sulfate in Lake Creteil (Southeast of Paris, France),
W82-03583 2H

GABIONS
Model Studies of an Overtopped Rockfill Dam,
W82-03694 8E

GAGING STATIONS
Rainfall Interstation Correlation Functions. II. Application to Three Storm Models with the Percentage of Dry Days as a New Parameter,
W82-03422 2B

Rainfall Interstation Correlation Functions. I. An Analytic Approach,
W82-03467 2B

GAMMA RADIATION
Airborne Soil Moisture Measurement Using Natural Terrestrial Gamma Radiation,
W82-03685 2G

GASES
Health and Safety of Wastewater Treatment Plant Personnel,
W82-03535 5D

GEOCHEMISTRY
Minor - Element Distribution in Mineral and Thermal Waters (Repartition des Elements Traces dans les Eaux Thermo-Minerals),
W82-03541 2F

Geochemical and Isotopic Characteristics of Spring and Groundwater in the State of Sao Paulo, Brazil,
W82-03542 2F

Identification of Connate Water in Interstitial Solution of Chalk Sediment,
W82-03642 2K

The Influence of Peripheral Sabkhas on the Geochemistry and Sedimentology of a Tunisian Lagoon: Bahiret El Biban,
W82-03684 2K

GEODETIC LEVELLING
Investigation of the Accuracy of Water Level Transfer to Determine Geodetic Elevation in Lake Ontario,
W82-03515 2H

GEOHYDROLOGY
Geochemical and Isotopic Characteristics of Spring and Groundwater in the State of Sao Paulo, Brazil,
W82-03542 2F

Temporary Hydrologic Changes After Deforestation for Pioneer Homesteading,
W82-03544 4C

Dissolution of Salt on the East Flank of the Permian Basin in the Southwestern U.S.A.,
W82-03586 2F

Analysis of Ground-Water Hydrographs for Defining a Crystalline Hydrogeological Environment,
W82-03648 2F

GEOLOGIC FORMATIONS
A Closer Look at Deep Well Disposal of Wastes,
W82-03646 5E

GEORGIA COAST
Patterns of Groundwater Salinity Changes in a Deep Continental-Oceanic Transect Off the Southeastern Atlantic Coast of the U.S.A.,
W82-03582 2F

GERMINATION
Drought Resistance of Sorghum Bicolor L. Moench. 3. Seed Germination Under Osmotic Stress,
W82-03479 2I

GLACIERS
Recrystallisation and Electrical Behaviour of Glacier Ice,
W82-03702 2C

GLUCOSE
Anaerobic Activated Carbon Filter for the Treatment of Phenol-Bearing Waste Water,
W82-03680 5D

GOCHEMISTRY
Natural Temporal Variations in the Chemistry of Shallow Groundwater, Athabasca Oil Sands Area, Alberta,
W82-03611 2K

GOVERNMENT SUPPORTS
Urban Water Systems: Problems and Alternative Approaches to Solutions,
W82-03580 5F

GRANTS
EPA's I/A Program Speeds Use of New Wastewater Treatment Methods,
W82-03737 5D

GRAPHICAL ANALYSIS
Uniform Flow Calculations for Pipes,
